# PREFACE

For several years there has been need for some compact, authoritative encyclopedic work in English dealing with the arts. Small art dictionaries, as have been published abroad for some time were not making available the definitive technical and critical information sought by the increasing audiences of the arts. Teachers and students of the arts, amateur and professional aestheticians, museum workers, and artists have been wanting some concise source of information dealing with the various aspects of their respective fields of artistic activity and appreciation. The present work is an answer to that demand.

While many subjects are covered by the *Encyclopedia* it is by necessity incomplete; a complete account of the arts could hardly be less than a comprehensive explanation of human nature and its history. Selection having been made, it became necessary to find those persons who would be most competent to speak authoritatively upon the subjects chosen. That we succeeded on this score can hardly be questioned by any who examine our roster of contributors. With regard to these contributors no praise is too high for their efforts to make the *Encyclopedia* a success. Without exception they worked with the greatest of care and enthusiasm, often under unusual circumstances brought about by World War II.

These war conditions multiplied what would normally have been a host of problems involved in the planning and carrying out of the *Encyclopedia* project. Yet it was judged better to go on to publication rather than postpone the project indefinitely, perhaps forever. The best argument for "seeing the thing through" lies in the fact that as we approach the termination of hostilities and are ever more aware of the post-war problems of reconstruction we realize the need for such a work as this in the cultural renaissance which shall and must come if we are to have a lasting peace and a better world in which to live.

We wish to extend our thanks to Dr. Thomas Munro of the Cleveland Museum of Art and Dr. Max Schoen of Carnegie Institute of Technology for their sustaining interest and valuable advice. Special thanks go to Miss Prudence Myer of the Cleveland Museum of Art for her assistance in reading of page proofs. As for the contributors themselves, their research and writing for the *Encyclopedia* was in most instances merely the beginning of their contributions; their suggestions, corrections and continued interest constituted the *élan vital* of the entire project from start to finish.

## CONTRIBUTING EDITORS

Listed below, in alphabetical order, are the initials of the authors contributing to the *Encyclopedia*. These initials appear at the end of each contribution and the reader may identify the author by referring to this list. Note that the listing is an alphabetical arrangement of initials rather than surnames, the former system having been judged to be of greater convenience to the reader.

A. J. S.—Alois J. Schardt, Los Angeles
A. K. C.—Ananda K. Coomaraswamy, Museum of Fine Art, Boston

## *TOPICAL SUGGESTIONS*

Listed below, under general headings, are some of the major articles and definitions to be found in the ENCYCLOPEDIA. The list is by no means exhaustive; e.g., no mention is made of several important articles on etching, photography, clavilux, prints and print processes, poetry, the novel, and others. The reader should not take this topical outline as indicative of the scope of the ENCYCLOPEDIA but, rather, should regard the suggestions given as a cross reference aid to his casual reading of the pages that follow.

**AESTHETICS:** AESTHETIC INQUIRY, current types of; AESTHETICS; AESTHETICS, recent trends in; **ART;** art criticism; ARTIST, PSYCHOLOGY OF THE; art tests; beauty; classification of the arts; design; engineering, aesthetics of; equilibrium; form; formalism; idealism; imagination; impressionism; inspiration; linear; LITERARY CRITICISM; materialism; naturalism; organic; painterly; participation; PHILOSOPHY OF ART; PSYCHOLOGY OF ART; rationalism; realism; regionalism; socialist realism; sociology of art; style; symmetry; TASTE AND ITS EDUCATION; unity; variety in unity.

**ARCHITECTURE:** ARCHITECTURE; balloon framing; Bauhaus; Brazil, The Colonial Architecture of; bridge; BYZANTINE ARCHITECTURE; CANADA, ARCHITECTURE OF; Carolingian architecture; castle; CIVIC PLANNING; Cluniac architecture; color in architecture; domestic architecture; EARLY CHRISTIAN ARCHITECTURE; functional architecture; GREAT BRITAIN, ARCHITECTURE OF; house; housing; INTERIOR ARCHITECTURE AND DECORATION (INTERIOR DESIGN); international architecture; LANDSCAPE ARCHITECTURE; Lombard architecture; Mexico, post-Conquest architecture of; monastic architecture; Neo-classic architecture; NEW ATTITUDES FOR THE FUTURE OF ARCHITECTURE; Queen Anne architecture; Romanesque architecture; synagogues.

# A

**a.** See NOTATION; ACOUSTICS.

**Aaklae weaving.** See SCANDINAVIAN ART.

**Aaron Ha-Kodesch.** See synagogues.

**aba** (Ar.). A coat. See COSTUME ART.

**abacus.** A slab forming the uppermost member or division of a capital.

**abat-jour** (F.). A device to regulate the quality of daylight by throwing the light downward as it enters a window. The effect is obtained by the use of a screen or skylight. —R.L.W.

**Abbasid art.** See ISLAMIC ART.

**abbey.** Large-sized monastery, Benedictine, Cluniac, Cistercian. Their plans, possibly derived from late antique villas, show a cloister south of the church, enclosed by dormitory and chapterhouse (east), refectory (south) and cellar (west). This nucleus may be surrounded by workshops, agricultural buildings, hospital, garden, schoolhouse, abbot's residence and guest house (parchment plan of St. Gall, ca. 820; description of Farfa, 1038-49; Montecassino, 1075; Cluny 980 and 1085 resp.). See Viollet-le-Duc, *Dictionnaire raisonné,* 1858, s.v. *architecture monastique;* Schlosser, *Die abendlaendische Klosteranlage,* 1899. —R.K.

**abbozzo** (It.). Sketch or preliminary draft of a work of art.

**Abhaya mudra** (Skr.). Mystic gesture symbolizing protection, fearlessness. Right hand, shoulder high, all fingers extended, palm outward. See mudra. —J.A.M.

**absidiole.** See apsidiole.

**absolute art.** (1) Art for art's sake (q.v.). (2) Abstract painting and sculpture, the music of forms and colors (see post-impressionism). (3) Schelling's conception of art as developed in his *System of Transcendental Idealism* (1800)—though Schelling himself does not use the term "absolute art". According to Schelling, Philosophy's main task is to explain knowledge, either by beginning on the side of the object and showing how the subject (intelligence, consciousness) is added to it—this is done in the Philosophy of Nature—or else by taking the subject as the primary principle and explaining the object in terms of the subject—this is the task of the Philosophy of Transcendence. The latter has, in turn, two branches, viz., theoretical philosophy which assumes that ideas can be determined by objects existing independently of them; and practical philosophy which assumes the opposite, i.e., that our ideas can influence the objective order. These two assumptions are contradictory and their conflict engenders the highest problem in the philosophy of transcendence, the problem of how ideas can be dependent upon objects and at the same time objects dependent upon ideas. This problem can be solved only if there is a pre-established harmony between the world of the objects (nature, the unconscious) and the world of the subject (ideas, intelligence, consciousness). The world of the object must be the unconscious product of the same activity that consciously produces the world of ideas.

But where can an activity be found that in itself guarantees the union of unconsciousness and consciousness, of objectivity and subjectivity, and thus denotes the point upon which the whole philosophy of transcendence hinges? The activity is to be found in the sphere of the subject itself: it is the aesthetic activity of the genius. Every true work of art bears witness to the identity of the conscious and

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

unconscious activity in the subject. However skilful, prudent and deliberate the genius may be, "with respect to the properly objective side in his production he seems to stay under the influence of a power which separates him from all other beings and forces him to utter or represent things which are not completely transparent to him and whose meaning is infinite." (*System of Transc. Ideal.* p. 291). Art is the objective "revelation of the holy of holies" (op. cit., p. 302), of the absolute; it shows the union of the subjective and the objective, and philosophy of art, in which theoretical and practical philosophy are united is the keystone of the whole philosophical edifice.

Swept along by the artistic enthusiasm of German romanticism, Schelling thus assigned to art—the only objective revelation of the absolute—a place superior to philosophy and religion. Nowhere before or since has philosophy so readily yielded its primacy to art—a role, however, which art held only for a moment. Schelling himself, in his lectures on the *Philosophy of Art* (1802-3), was soon to achieve a juster, more balanced view.

—W.C.

**absolute dance.** A type of dance in which movement relies solely upon its own power to arouse emotive forces. It is not concerned with specific happenings or descriptions, nor does it depend upon extraneous aid, such as costume, stage setting, lighting, or music for its communication. Its movements are organized into a composition for no other reason than to be expressive of whatever beauty and meaning is embodied in them, and for the satisfaction of their being given form.

Although the movements of absolute dance are composed primarily to communicate feeling of motor origin, and not as motor symbols expressive of feeling states, they have the power to appeal to the intellectual, imaginative, and emotional natures and thus they may afford a very complete and satisfying aesthetic experience. Such dances may have any flavor from the comic to the tragic and may suggest a complete picture of gaiety, hope, despair, awe, or tranquility. Their expressive and communicative qualities, however, depend upon the spontaneous inspiration of the dancer. Meaning is immediate and seems to emerge spontaneously from the movements. Without this element such dances would exist as a series of well executed calisthenics and have little value as art. Absolute dance, like absolute music, may be thought of as dance in its purest form.

—M.N.H'D.

**absolute music.** (1) Music without words. (2) Music void of extra-musical content or subject matter.

**absolute pitch.** *Mus.* (1) The pitch of a tone when regarded or defined physically or acoustically or when referred to a standard thus established; opposed to relative pitch. (2) Aural recognition of the pitch name (C, $E^b$, etc.) of a single tone, irrespective of other tones.

**abstract.** See abstraction.

**abstract cinematograph.** See PHOTOGRAPHY.

**abstraction.** (1) In art, a design in a graphic or plastic medium which is non-representational in purpose, is ordinarily more or less geometric, but occasionally amorphous or vaguely biomorphic, and which presumes to have at least decorative beauty and may have cultural meaning and associations. It may be derived or abstracted from natural forms, may intend to portray the essential geometric structure of such forms, or may be entirely the product of aesthetic ingenuity, invention, and intuitive imagination without reference to natural forms. The free invention of designs is sometimes spoken of as 'non-objectivism' (q.v.) or 'pure-abstraction', and titles are generally numbered "Compositions" or "Improvisations" as in music. Designs derived from natural forms, particularly if any visible likeness to these forms survives the transformation, are spoken of as near-abstractions. Cubist painting (q.v.), however, is ordinarily too strongly suggestive of recognizable natural forms even to be called near-abstraction, but may be classified as semi-abstraction.

From a formal point of view, abstraction is the extreme opposite of naturalism (q.v.) in that it stresses the abstract (Universals) rather than the concrete (Particulars); but it is not necessary to the concept of abstraction that the form shall coincide with the essential structure of natural forms as in idealism. Instead it may be either largely or entirely a matter of the artist's self-expression.

(2) Abstraction is also used in the sense of abstractionism in reference to a principle or doctrine favoring the painting or carving of abstractions. As such it is a modern movement which flourished from the first world war to about 1930 and is still followed by numerous adherents in France, England, and America.

Little *abstract sculpture* has been produced

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

in the history of art, but modern abstract artists occasionally recall paleolithic and neolithic and some African primitive precedents. Since it is difficult to produce purely abstract sculpture of originality and aesthetic merit, most modern exponents are near-abstractionists or semi-abstractionists. Such sculptors include Archipenko, Brancusi, Belling (frequently), Lipschitz, Laurens, Duchamp-Villon, Picasso (occasionally), Henry Moore, Nicholson, Hepworth, Gabo, Pevsner, Rodchenko, Giacometti, Arp, Vantongerloo, Schwitters, Calder, and Robus.

*Abstract painting* is more popular than sculpture. Arising out of cubism in the early 1910's, it took many forms, most of which, like many of Picasso's paintings, are only semi-abstract or near abstract. It became 'Purism' (q.v.) at the hands of Ozenfant and Le Corbusier; 'Synchromism' (q.v.) with Russell and Wright; 'Orphism' (q.v.) with Delaunay, and Kupka; 'Futurism' (q.v.) with Severini, Russolo, Balla, Carra, and Boccioni; 'Dadaism' or 'Surrealism' (qq.v.), and usually amorphic or biomorphic rather than geometric, with Arp, Ernst, Picabia, Miro, Masson, et al.; and amorphous expressionism with Kandinsky and Klee. It was applied to photography and films by Man Ray, Moholy-Nagy, Leger, and Richter. And it became completely abstract and geometric with the Dutch 'de Stijl' group and 'Neo-plasticists' (qq.v.), e.g. Mondrian, Domela, and Van Doesburg; with the Russian 'Suprematists' and 'Constructivists' (qq.v.), Gabo, Pevsner, Malevich, and Rodchenko and the Hungarian 'Constructivist' Moholy-Nagy; with the English abstractionists Wadsworth and Nicholson; with the French "Abstraction-creationist" (q.v.) Hélion and with the American abstract artists, e.g. Feininger, Dove, Marin, Stuart Davis, Xceron, and 'non-objectivist' Bauer. See A. H. Barr, Jr., *Cubism and Abstract Art,* 1936. —L.D.L.

(3) Dance activity, as all art activity, lies in the realm of *abstraction.* The artist focuses his attention upon the essential nature of an experience and emphasizes that essence by every means in his power that he may express and communicate in movement his idea of it. Abstraction in movement is accomplished by the dancer searching within the movements commonly associated with an idea or feeling for movements that are more directly related to the basic material, or the essences, of his experience. He then consciously magnifies or distorts (see distortion) that particular movement or phase of a movement which is most nearly synonymous with the essentials as he perceives them. Although abstraction is the antithesis of realism, it nevertheless has its roots in reality. It is when abstraction is carried beyond any reference to reality that confusion and lack of communication results. —M.N.H'D.

**Abstraction-Création group.** A group of geometric-abstract painters and sculptors in Paris in the early 1930's, led by Piet Mondrian and including Jean Helion. —L.D.L.

**abstractionism.** A little-used term synonymous with the doctrine of *abstraction* (q.v.).

**abstract music.** See absolute music (2).

**abstract painting and photography.** See PHOTOGRAPHY.

**abstract seeing.** See PHOTOGRAPHY.

**abutment.** That which receives the end of, and gives support to, anything having a tendency to spread out, or to thrust out; a supporting or buttressing structure, as at the end of a wall. —J.M.M.

**abutter.** See CIVIC PLANNING.

**academicism.** As applied to art creation and appreciation, the term, academicism, is used in a classical period or in one where art is a means to an end other than aesthetic, as one of approval; in a romantic period or in any "modern" period it connotes the force of tradition. Academicism stresses formal relationships as contrasted with vital expression; its locale is the studio, if not the study, rather than the world of nature and man. Yet time and again the significant artists of a time are found to be builders on academic foundations. Even a Cezanne expresses a desire to paint as the old masters in the museums did, as well as to, or rather, in order to, "realize" objects in nature.

The prototype of all learned academies, with their resulting influence called academicism, was Plato's Academy in the groves beside the Cephissus outside Athens. The most noteworthy modern one is the Academy of Fine Arts in Paris, a section of the French Academy, founded by Louis XIV in 1648. From its members is chosen the Director of the French Academy in Rome. The training in the École des Beaux-Arts in Paris and in the Villa Medici at Rome has had a strong influence on French art and taste. In so far as Paris became the art center of the western world in the nineteenth century this influence affect-

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

ed art throughout the western hemisphere, even if it was negatively so, as the twentieth century approached. In the United States generations of painters have time and again marked their advent by "seceding" from the National Academy of Art until maturity or senility, as it is variously interpreted, lead them to synthesize the new with the old.

In some civilizations the academic point of view has been so completely shaped by the artist that room has been found in a strait jacket. True, the confining garment has been amply proportioned. Egypt and China and Byzantium are cases in point. The breakdown on occasion of conventional forms did not in the long run add stature to the Egyptian achievement. When they created within the limits of their millenial conventions, they radiated. Again, the traditions of Chinese craftsmanship, where artisan and artist are one, are not often honored by ignoring them. And one recalls that Byzantine tradition served medieval symbolism well and was vital enough after a thousand years to restrain Giotto, to inspire Duccio, and to inform Abbot Desiderius of Monte Cassino. On the other hand, the late or academic phase of Greek art was not always helpful to Roman or to Hindu. The Renaissance florescence all too soon ran into academic correctness which justified, if it did not occasion, baroque extravagances. As neo-classism, it encouraged the substitution of taste for expression and produced Canova and Thorsvaldsen as well as David and Ingres. Yet even here such continuities as Palladio-Inigo Jones-Wren-Latrobe and Rubens-Reynolds-Stuart produced notable results which still arouse admiration. A recent example of academicism triumphant is found in the flourishing American Academy at Rome where archaeology and art are taught to selected youth in storied settings. It inspires and conditions, and may also cramp, future creation. Paul Manship comes to mind.

Academicism has found expression in the art theories of practising artists and in the aesthetic theories of historians and critics. The former are often helpful to those who would appreciate works of other times and places; the latter to those who would understand historical and philosophical trends, and on occasion they are sufficiently suggestive to cause the reader to rethink and classify his own standards of judgment.

As an example of the former one might instance the evolution of the academic ideals of painting in the Italian Renaissance. Leonardo pointed out that modelling is the first purpose of the painter and that movement is a sure means of suggesting emotion. He urged selective imitation. He would illuminate pleasantly, counterpoise easily, compose freely. By the later 16th cent. the "Grand Style" was forming. Vasari, calling it the "modern" style and naming Leonardo as its initiator, points out that Fra Bartolommeo and Giorgione by graduation of color attained "force, relief, sweetness, and grace". Raphael reached complete perfection, he thinks, comparable to that attained by Apelles and Zeuxis in ancient times. Andrea del Sarto produced works sweeter and less bold, but "free from errors". Thus the stage is set for the eclectic to become the academic, and the critic to replace the master. In the early 18th cent. Lodovico Dolce showed how Titian combined the grandeur and terribleness of Michelangelo, the pleasantness and grace of Raphael, with the coloring "proper to nature", and, late in the century Sir Joshua Reynolds strikes the true classical note when he urges the embodiment of the abstract idea back of individualities. Beauty, simplicity, and nobility were the ends to be sought. As late as the early 20th cent. Kenyon Cox was still writing that the classic (academic?) point of view seeks "the essential rather than the accidental, the eternal rather than the momentary — loves impersonality rather than personality . . . to steep itself in tradition."

But the story of academicism in the 17th to the 20th cent. is also illustrated in works of art criticism and art history—Winckelmann, Goethe, Ruskin, Burckhardt, Woelfflin, Wilenski. In only a few cases in these years has an artist, Adolf Hildebrand, for example, successfully rationalized his creative ideas. The dangers of such a divorce as is here suggested between art and life are recalled by the successive clichés which have confused as well as clarified—"the sublime and the beautiful", "feeling is everything", "the lamp of truth", "art for art's sake", "significant form", "flowing space". Yet the intelligent layman is grateful for Woelfflin's analysis of Renaissance design into its linear, planar and recessive, closed and open, multiple and unified, and clear and unclear aspects. He is also grateful to Geoffrey Scott for his "fallacies" — biological, mechanical, romantic, and ethical — of architectural criticism; to Wilenski for his insistence that the artist alone is qualified to act as critic of his work; and to Panofsky for his iconographical interpretations of works of art. He is grateful if for no other reason than the stimulating one of disagreement. From

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

William Morris to Walter Gropius the academic approach has shown itself capable of possessing rejuvenating power, which suggests that tradition is not necessarily enslaving, that craftsmanship and artistry are not necessarily opposed, and that academicism and creation have much in common. See A. Hildebrand, *The Problem of Form,* 1907; Leonardo da Vinci, *Notebooks,* edited by Edward McCurdy, 1938; E. Panofsky, *Studies in Iconology,* 1939; S. Pevsner, *Academies of Art,* 1940. —W.S.R.

**academy.** An institution devoted to the disinterested furtherance of some desirable non-religious activity above the level of political and economic needs. The name 'Academy' is derived from a district in Athens in which Plato used to converse with his pupils and to teach them his philosophy. The name was revived by idealistic humanist circles during the early Italian Renaissance of which the most influential was the group gathered around Lorenzo de' Medici in Florence. It then used to designate the informal meeting of cultured and learned men to discuss in congenial surroundings problems of philosophy and science. Even the academy of Leonardo da Vinci referred to in inscriptions in some of his engravings seems to have been of that kind. In the 16th cent. the use of the word spread to cover almost any regular gathering for almost any ideal or recreational end.

Academies of art fall from the beginning into two distinct groups. Studio academies are gatherings of mature and incipient artists in somebody's private workshop for the purpose of drawing after sculptural or living models. Such was the academy of B. Bandinelli (1531), the earliest artistic enterprise known under that name, and that of the Caracci in Bologna (after 1590); the latter affected some of the pretensions of contemporary official institutions. Although, particularly in Italy, private studio academies were never quite discontinued even in time of severest institutionalization, their heyday dawned in 19th cent. France, owing to the initiative of J. L. David who transplanted the Italian type to Paris while adopting some of the strict pedagogical routine of the official institutions.

From the beginning official academies differed from the private by their wider aims and their higher pretensions. They were designed to lift the artist from the level of the medieval craftsman to that of the creator by freeing him from the jurisdiction of the guilds. In order to achieve this, the founders usually invoked the protectorate of the absolute monarch, a device which in many cases resulted in the subservience of the freshly emancipated artist to the crown. Moreover they found it feasible to give to the institution a clearly defined representational function enhanced often by high sounding names and titles. The pedagogical aims of the academy, although not much emphasized in the early foundations, came more and more to the fore in a development which culminated in the 19th cent. monopoly of academies and related institutions in all matters of artistic education. Until then the artist had received his elementary education in the workshop of his master (see *bottega*) and the academy had attempted no more than to raise him to the demands of the grand style (q.v.) by perfecting his knowledge of design. It is only in the 19th cent. that academies added instruction in the actual technique of painting to their classes in drawing first after drawings, then after plaster casts and living models.

All official academies trace their origin back to the *Academia del Disegno* founded in 1563 by G. Vasari. Its immediate offspring was the *Academia di San Luca* in Rome (1593), the organization of which became the prototype of Lebrun's and Colbert's *Academie Royale de Peinture et de Sculpture.* The latter in turn, with its elaborate order of precedence, its mode of training, its artistic doctrines, its prizes and its affiliate institution in Rome, was the model for similar enterprises throughout the 17th and 18th cent. Even its close dependence on the court seemed worthy of imitation as long as there were absolute princes eager to engage art in the service of their cause. A new upsurge in the foundation of academies occurred in the second part of the 18th cent. owing to the belief of local potentates that academic education of taste among craftsmen would redound to the economic advantage of their country, — an argument narrowly utilitarian, but timely at a period when the abolition of guilds and the beginnings of the industrial revolution were undermining the hitherto solid foundations of European craftsmanship. The academies, how-

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

ever, failed to educate the craftsman and later saw that task relegated to schools of industrial arts. Instead of following the 19th cent. trends toward machine production and bourgeois realism they conservatively proclaimed their stewardship of the grand style thereby laying themselves open to criticism, since that style had lost its social justification after the end of absolutistic rule. The battle between independent progressive artists and the academies fills the annals of the 19th cent. That battle was lost by the artists socially, since their emancipation became a more and more bitter isolation; but it was won by them artistically, since the academies had to give up their tenets one by one to come to terms with modern modes of expression. See N. Pevsner, *Academies of Art*, 1940. —R.B.

**academy board.** During the 19th cent. this material came into use as a support for painting. Usually it was a piece of pasteboard about ⅛ in. thick and with a pale gray or white ground of lead pigment mixed with oil, and with various other ingredients. The name probably came from its wide use in art schools where it furnished a cheaper support than wooden panels or stretched canvas. A somewhat similar material has the pasteboard as a secondary support and over it is attached a piece of canvas with the usual painting ground. This goes by the name, "canvas board." Probably such materials were not economical before the manufacture of pasteboard from wood-pulp toward the end of the 18th cent. The commercial manufacture of these boards goes back at least to 1819. —G.L.S.

**acanthus** (Gr.). Architectural decoration, based on a conventionalization of the large dentate leaves of the acanthus plant. The most notable use has been on Corinthian capitals. The first known examples are on the interior columns of the temple of Apollo at Bassae in Southern Greece, dating about 420 B.C.; two girdles of modest acanthus leaves spring from the lower part of the capital. As the Corinthian style increased in favor, esp. in Roman times, the acanthus leaves became larger, projected further, and were more deeply undercut, becoming a luxuriant growth, the chief element of the capital. On Byzantine and Romanesque capitals they often appear, but the earlier exuberance is checked and the leaves are kept close to the block. The motif has also been used for other decorative purposes: girdling the great column supporting three dancing maidens and a tripod at Delphi; as a finial on the Choragic Monument of Lysicrates at Athens; and as relief decoration on the side of the Ara Pacis and on Roman and Renaissance pilasters and borders, where curving tendrils unite with the acanthus to form the popular rinceau pattern. In Oriental art this motif is similar to the Greek and Roman form. —W.R.A.

**a capella.** Unaccompanied choral music; in chapel style.

**acca.** A fabric of silk and gold made during the Middle Ages, probably in Syria.

**accent.** Dynamic stress put on a musical element, either because of its placement in a pre-established metrical pattern (*systematical accent*: see rhythm, meter, idiom B), or for the sake of phrase articulation (*phrase accent*: see phrase, articulation). In tonal music both kinds of accents are used; in modal and atonal music phrase accent prevails (see idiom). —E.K.

**Accentualists.** See MEDIEVAL MUSIC.

**accentus, concentus.** Those parts of the liturgy such as the Collects, the Epistle and Gospel, the Preface, etc., which are recited in a monotone with occasional inflections and cadences by the priest, deacon or subdeacon are styled *accentus*. The *accentus* may not be accompanied. Those parts of liturgical song which are performed by the choir (or two or three singers) such as the divisions of Ordinary of the Mass and Proper of the Mass are styled *concentus*. See Mass. —V.A.

**accessory use.** See CIVIC PLANNING.

**accidental.** See NOTATION.

**accidental vanishing point.** See PERSPECTIVE.

**accompaniment.** That which supports a musical composition.

**accordatura.** In stringed instruments of the lute- and viol-classes, the regular or usual series of pitches to which the strings are tuned.

**accordion.** See MUSICAL INSTRUMENTS.

**acerra** (L.). A container for incense.

**acetate rayon.** Fiber, yarn or material made by the acetate process, a process in which the product is not reconverted cellulose but an ester of cellulose, i.e. cellulose-acetate.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

**acetone.** Used occasionally as a solvent for painters' varnishes, particularly those derived from synthetic resins and plastics, acetone is more widely used in removing varnishes than in compounding them. Chemically, it is a dimethyl ketone. It has the unusual property of being miscible with water, oils, and most other solvents. Its action on resin is rapid and, if solution is not complete, it is apt to leave a white mark where the resin film is blanched on rapid cooling and condensation. Acetone is fairly safe so far as toxicity is concerned, but its vapors are highly flammable. —G.L.S.

**Achaemenid art.** See PERSIAN ART.

**achievement.** See HERALDRY.

**Achilles.** The leading warrior of the Greek tribal expeditionary force in the siege of Troy, hero of Homer's *Iliad*. His exploits were a favorite subject of Greek vase painters and gem cutters; one of the most famous portrayals is in Brygus' *Priam Ransoming the Body of Hector*. In post-classical sculpture he was represented by Thorvaldsen, Dannecker, Bissen, Westmacott and Herter. —W.R.A.

**achromatic color.** A color without hue. See COLOR.

**ACOUSTICS.** Literally the science of hearing, is here taken to include the physical means by which music is produced, the media through which the vibrations may be transmitted and the circumstances under which the sound is received.

The **pitch** of a sound as perceived by the ear is largely determined by the **frequency of vibration**: that is, the number of to-and-fro motions completed by the vibrating body per unit time. The **loudness** depends upon the **amplitude** (one-half the total extent of vibration), and the **tone-quality** upon the **wave-form.** Any complex form of vibration may be built up by the superposition of simple vibrations of different frequencies, and these components are called **partials.** Pitch, loudness and quality are the three subjective attributes which primarily correspond to the three physical characteristics, but they are all somewhat interrelated. For example, when the loudness of a simple tone in the neighborhood of middle C is increased, the pitch decreases even though the frequency is kept constant.

A musical instrument consists of the vibration producer proper, usually a **resonator** for selecting, modifying and/or assisting the transmission of sound to the surrounding air, and mechanism for controlling same. In addition to the voice, **vibrators** now commonly used to initiate sounds for musical purposes are as follows, the name of a typical instrument being given in parentheses:

(a) **bar** or **plate** (xylophone), struck, bowed or blown;
(b) **membrane** under tension (drum);
(c) **string** under tension (violin), plucked, bowed, struck or blown;
(d) **air jet** (flute);
(e) **cane reed** (clarinet), either single or double;
(f) **lip reed** (cornet), meaning the vibrating lips in a **cupped mouthpiece;**
(g) **electric oscillation** (Novachord).

The first three produce vibrations of fixed frequency, determined by the size, density, tension or elasticity of the vibrator, whereas the next three are really means of producing pulses of air at a rate primarily determined by the associated resonator. Sound producer (d) leaves the end of the resonator to which it is attached relatively open to the surrounding air, whereas (e) and (f) behave as if to close the resonators to which they are attached. The electric oscillations of predetermined frequency, after being amplified electrically, are converted into sound by a loud speaker.

The resonator is of particular importance to the tuning of a wind instrument, since it largely determines the pitches which may be obtained. The air in a cylindrical tube open at both ends (example: flute) vibrates best in those ways, or modes, whose frequencies are to each other approximately as 1, 2, 3, 4, 5, etc. Frequencies which are exactly in these relations are called **harmonics.** Starting with the **fundamental,** which is that **mode of vibration** which provides the lowest frequency, the next is an **octave** higher (2/1 ratio), and the next a **twelfth** (3/1) above the fundamental. These modes of vibration should not be confused with the **partials** which make up the complex sound associated with any one mode of vibration, for the frequencies of the two are not always identical. Usually the partials from a wind instrument are harmonic, but the modes of vibration often depart somewhat from the simple 1, 2, 3, 4, 5 series.

The **normal modes of vibration** in the air of a cylindrical tube closed at one end (example: clarinet) have frequencies which are to each other approximately as 1, 3, 5, 7, etc. The fact that the gap between the lowest and the next lowest mode of vibration is a twelfth (ratio 3/1) necessitates **key mechanism** and

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

**tone holes** on clarinet to bridge the gap of 19 semitones, whereas the mechanism of an **octave instrument** such as the flute needs only to fill in the gap of 12 semitones.

The **tapered tube resonator** may take a variety of forms ranging from the near conical shape of the oboe to the rapidly flaring French horn. A cone open at the large end and complete to its apex, terminated by either an open or closed end, theoretically sustains a full series of harmonic modes of vibration. A cone with small end closed, but not at the apex, gives rise to modes of vibration which are inharmonic. Since the mouthpiece cannot be attached quite at the apex (notice saxophone) the conical bore must be modified somewhat to restore approximately the harmonic relationship. In the course of years the shape of brass instruments has evolved such that the modes of vibration are nearly in the ratios of 2, 3, 4, 5, 6, even if the lips do in effect close the small end.

When a wind instrument emits a musical tone, the air inside it does not vibrate at the same amplitude throughout. At some spots (such as open ends) the air vibrates vigorously, and these places are called **antinodes.** At others (such as closed ends) there is a minimum of motion and these places of "no motion" are **nodes.** For different modes of vibration these nodes and antinodes appear in different positions throughout the tube. A reduction in cross section near an antinode lowers the frequency of that particular mode of vibration; a constriction near a node has a sharpening effect. By such modifications in the **bore** the "open" tones of a cornet, for example, may be tuned with respect to each other.

Sound is propagated through any medium at a speed which depends upon the density and elasticity of that medium. For free air at ordinary temperatures, this is about 1100 ft/sec. Now, the characteristic frequencies of a resonator are proportional to the velocity of sound in the contained air. Inasmuch as the density of air becomes less as the temperature rises, the velocity of sound increases, and a wind instrument becomes sharper in pitch as the air within it is warmed.

A musical scale (see scales and modes) is often defined as a series of tones ascending or descending in frequency by definite **intervals** (q.v.) suitable for musical purposes. However, some contend that each tone of this scale is subject to slight "mutation" in pitch depending upon the other tones with which it may be sounded. The so-called **just scale,** built from intervals found in the harmonic series, has intervals which are not equal. As a consequence, a **keyboard instrument,** such as the piano, having only 12 tones to the octave, cannot be tuned to produce just scales in all keys. The compromise commonly accepted today is **equal temperament** wherein the 12 intervals to the octave are equal, i.e. each successive frequency bears the same ratio to the one preceding.

The range of the organ usually extends an octave above that of the piano and often down to $C_0$=16.35 cycles/sec. The subscript notation here employed to identify the octave in which a tone lies is one of several used by different groups of musicians. Among the advantages of this method over others are the uniformity of characters (capital letters and subscripts only), subscripts fitted nicely into the musical range and requiring ordinarily but one digit, and the significance of the subscript in giving the number of octaves from $C_0$, which has a frequency approximately at the lower limit of hearing.

The **A** of 440 cycles/sec., which is now **American standard pitch,** seems likely to become **international pitch.** The history of music shows that during the past century **standard pitch** has fluctuated over considerably more than a semitone from below to above this value. Particularly since the prevalent use of wind instruments the insidious tendency has existed to raise the pitch standard, but evidently no lasting benefit has been gained from the higher pitches, and twice a costly return to a lower standard has been necessary.

The auditorium in which music reaches the listener modifies the actual sound which reaches his ears. When the sound starts from the stage part of it passes directly to the listener, while another part may travel a longer path and reach him via reflection from the ceiling. If the reflected part sounds like a distinct repetition of the original it is called an **echo.** Usually, however, multiple reflections occur such that the ear is unable to separate the individual returns as distinct sound, so that even after the sound source has ceased a mass of sound of decreasing intensity exists within the room, resulting in **reverberation.**

This overlapping of sounds frequently becomes a menace to understanding of speech and, to a lesser degree, to the satisfactory reception of music. A remedy lies in reducing the intensity of the reflected sound by the use of sound absorbing materials appropriately placed on walls, floor and ceiling. Reverberation is desirable when it constitutes reënforcement of the direct sound, but the problem is

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

to eliminate those sounds which arrive noticeably late after traversing devious paths, greater than that of the direct sound by more than about 70 ft. Sometimes the shape of the auditorium is such that curved surfaces focus the sound to certain spots to the detriment of others. In the famed tabernacle at Salt Lake City sound is transmitted well to the most distant part of the balcony, yet there are positions near the center of the main floor at which it is difficult to understand speech. See E. H. Barton, *A Text Book on Sound,* 1926; A. Carse, *Musical Wind Instruments,* 1939; J. A. Jeans, *Science and Music,* 1937; A. T. Jones, *Sound,* 1937; V. O. Knudsen, *Architectural Acoustics,* 1932; E. G. Richardson, *Acoustics of Orchestral Instruments,* 1929.

—R.W.Y.

**acoustics, terminology in.** (*Physical vs. Mental in acoustic correlates for music and speech*). Sound has a physical aspect and an approximately parallel mental aspect. For each of these, we have standardized terminology, but in most situations in music and speech we refer to both the physical and the mental. We, therefore, have three series of correlates in acoustic phenomena: the physical, the mental, and the integrated or total references.

The terminology for the physical aspect is based objectively on the physical attributes of sound waves; namely, **frequency, amplitude duration** of a sequence of waves, and **wave form.** Those represent the **tonal,** the **dynamic,** the **temporal,** and the **qualitative aspects** of the physical sound. Since all music exists directly or indirectly as sound waves; and, since sound waves have no other primary attribute than those mentioned, every element of the physical aspect of musical sounds may be accounted for in these four categories, their complex forms or derivatives. By combination of the four basic elements, endless varieties of melody, harmony, rhythm, volume, and tone quality may be represented. Each of these is defined in terms of units of energy, physical or electrical. For each of the four basic attributes, the physicist has also devised terms available for specific purposes; such as frequency modulation, energy, power, harmonic composition, or spectrum.

The terminology of the mental aspect roughly parallels the physical terminology in the naming of each category; namely, **pitch, loudness, time** and **timbre** as representing the **tonal,** the **dynamic,** the **temporal,** and the **qualitative aspects** of tones. For many artistic and for most scientific purposes it is essential that the distinction between the physical and the mental aspects, respectively, be adhered to logically and consistently and that there be no slip-shod or dodging shift from one to the other for the evading of clarity or to cover ignorance. The two are rarely exactly parallel. *Frequency,* for example, has many times the range of *pitch.* We seldom hear a tone as a true copy of the physical tone; the ratio of the physical to the mental is rarely 1:1. The pitch for a standard physical frequency of 440 may vary under a variety of environmental, physiological, psychophysical, and psychological conditions. A tone of 60 decibel energy level may vary widely in loudness in hearing; a one-second duration may seem much longer or shorter; the timbre correlated with a specific structure of partials may vary widely in hearing. We recognize these divergencies as normal illusions; some due to the limitations of the human organism or the instrument, others to artistic demands, conventions or training. Without many of these illusions there could be no good music. In defining the mental terms, we relate them to the physical aspect and, when necessary, indicate essential deviations of the mental from the physical parallelism.

But in conventional treatment of musical sounds, we are most frequently thinking of the total or integrated situation involving both objective and subjective factors and concerned with physical, physiological, and mental aspects. That is what music is; and for this we have the well established usage of employing the mental terminology, as when we speak of *concert pitch, staccato* or *legato movements,* a *major key, poor phrasing, vibrato, accent, resolution,* or harmony. Thus, whenever we speak or think of actual music or speech, we have the total situation in mind. The very words music and speech are exhibits of this. Unfortunately, that leaves us in the poverty of using the terms *pitch, intensity, time,* and *timbre* in two distinct meanings, that of the mental aspect specifically and that of the integrated situation in music and speech. We are here forced to depend upon the context or the universe of discourse to determine which of the two connotations is intended.

The Acoustical Society of America has a committee on terminology which publishes definitions from time to time in its Journal as clarification develops through experiment. In these, emphasis is rightly laid on consistent distinction between the mental and physical terminology; but only slight attention is given to artistic and common sense usage pertaining

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

to what I have here distinguished as the total situation. But the history of music, musical criticism, and much of the psychology of music deals with this integrated situation without any reason for making the acoustic distinctions between the physical and the mental. Psychology is not ordinarily concerned with the historical "body and mind" situation but rather with the functions of the integrated organism.

Psychological usage, in terms of which musical organization must be built, sometimes brings us into verbal conflicts. This is exemplified in the use of the terms *intensity* and *loudness*. *Loudness* is an appropriate synonym for *intensity* but *intensity* is an attribute of all sensation; for example, *intensity of taste, odor, color, pressure, pain,* and *sound*. Therefore, scientists have historically preferred the word *intensity* when the reference is dominantly to the total situation, and favor the term *loudness* for a purely mental aspect of experience and behavior. —C.E.S.

**acrolith.** A statue with trunk usually of wood and with extremities of stone; trunk often covered with drapery or metal.

**acropolis** (Gr. *akro'polis,* from *akro,* topmost, or peak, and *pólis,* city, the elevated part of a Greek city). The term refers to the summit of the crag or hill on and around which Greek cities were most commonly built, from the earliest period of established settlement. It is applied indiscriminately to this portion of a Greek city, whether its function be that of fortress or of temple area, as in the most famous example, the Acropolis of Athens. From its natural security, easily implemented by walls and redoubts to a condition of impregnability, this area was originally reserved to the chief of the community for his residence, and was maintained as a popular refuge in time of danger. In classic times, when the temple came to be conceived as the actual home of the god, and the chief's megaron was taken as its architectural prototype, the acropolis generally was transformed into a temple precinct, walled not so much for security against attack as to emphasize its ritual separation from the mundane life of the city. When prefixed by *the,* acropolis always refers to the celebrated templed crag of Athens. Elsewhere the term is used with an identifying prefix, which establishes its specific connotation of citadel or elevated temple area. Notable examples of the citadel-acropolis are Tiryns, Mycenae, Argos, Gortys and Daulia; of the temple-area acropolis, Athens, Thebes, Corinth and Silenus. —T.A.H.

**acroterium.** Over the three angles of the pediment of a Greek temple decorative statues or abstract designs, such as palmette, were often placed on pedestal blocks. They were called *acroteria* (topmost parts). On 6th cent. B.C., buildings they were often made of terra cotta; later ones were usually of marble. —W.R.A.

**acrylic resins.** See resins, acrylic.

**Actaeon.** A Greek hunter who was slain by Artemis when he saw her bathing. The subject was treated by 5th cent. B.C., Athenian vase painters, notably the Pan Painter. In modern sculpture a spirited representation is Paul Manship's group in the Metropolitan Museum, New York. —W.R.A.

**action.** *Mus.* In keyboard-instruments, the general term for the entire mechanism whereby the muscular acts of the performer are translated into motions and adjustments within the instrument so as to cause the desired tone-production.

**action current.** An electrical impulse generated by the flow of the nerve impulse and generally employed as a measure of the nerve impulse in sensory motor and central neural processes. See brain waves. —C.E.S.

**adagio** (It. *ad agio,* at ease or at leisure). (1) A type of academic exercise in classic ballet training, calculated to develop large, sustained movements, to the accompaniment of music in slow tempo. The first section of the daily classic ballet lesson is known as *allegro* (It., quick or rapid); the second, *adagio,* featuring held extensions of the legs, with deliberate arm positions to balance the body supported on a single foot. (2) Portions of a ballet or divertissement, in which male dancers support female partners, either on toe point, or by lifts through the air, covering floor space impossible to negotiate unaided. The so-called **grand adagio** is the emotional climax of the traditional classic repertory, performed by soloists as a stylized love-duet, ornamented by brilliant turns, held poses, lifts and foot work, in which the cavalier effaces himself to display the grace and technique of his lady. (3) A term borrowed by variety, circus and ball-room artists from the above to describe acts or numbers of acrobatic virtuosity, in which the female partner is tossed or swung by arm or leg in the air, in spectacular muscular feats, which are not, strictly speaking, dancing. —L.K.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

**Ada Group, school of the.** See Carolingian art.

**Adam style.** A term derived from the fashion created by the English architect and furniture designer, Robert Adam, who about 1760 led the reaction against the excessively curvilinear and feminine rococo designs of Chippendale and others. Actually he shared in a general trend toward a stricter imitation of Roman antiquity, made possible and stimulated by the archeological recreations of ancient sites, notably Herculaneum and Pompeii. The style aimed at a correct Roman impressiveness, with accessories by Wedgwood and furniture in harmony, but Adam's personal sensitivity to exquisite decoration in stucco gave his designs a delicate and coherent distinction. See INTERIOR ARCHITECTURE AND DECORATION; FURNITURE. —P.C.B.

**adaptation.** See RADIO DRAMA.

**additive color mixing.** See COLOR.

**addorsed.** *Her.* Turned or set back to back.

**Adena Culture.** An aboriginal American culture centering in southern Ohio near the Hopewell sites and extending into Kentucky, West Virginia, Pennsylvania and southern Indiana. It takes its name from the estate of an early governor of Ohio, where the first mound containing its artifacts was discovered. Far too little is known of the Adena type to determine its relation to the Hopewell, of which some authorities believe it is a phase. See Eastern North American aboriginal art. —H.G.

**ad libitum** (abbrev. *ad lib.*). *Mus.* In a concerted passage or piece, an indication that a part for voice or instrument is suggested, but not absolutely required for the intended effect.

**adobe** (Sp. Am. from Sp. *adobar,* to daub, to plaster; traceable through the Arabic term *attuba* or *attob* to an Egyptian hieroglyph meaning "brick"). Unburnt, sun-dried clay or mud mortar, sometimes made with straw, and often in brick form. —J.M.M.

**Adonay Malach mode.** See JEWISH MUSIC.

**Adonis.** The Asiatic lover of Aphrodite, slain by a wild boar and bitterly mourned by the goddess of love. The myth personifies the death of vegetation. In sculpture Adonis has been portrayed by Vincenzo de' Rossi, de Vries, Canova and Thorvaldsen. —W.R.A.

**advancing colors.** See COLOR.

**Aegean architecture.** The generic term for the buildings of the stone and bronze ages, e.g. the pre-Hellenic architecture, of the Aegean basin, which is understood in this reference to include the mainland of Greece, Crete, the Aegean islands, and the Aegean littoral of Asia Minor; its period extends through the bronze age to the decay and extinction of the Mycenean civilization in the Dorian invasions sometime between 1200 and 1000 B.C. Its Cretan phase, extending roughly from 2500 to 1200 B.C., is called Minoan; its mainland phases are called Mycenean and Helladic; and its expression in the Aegean islands Cycladic. Each of these phases has been subdivided for convenience into three, or multiples of three, periods corresponding to rise and development, climax, and decadence, or, Early, Middle and Late. This culture is not uniform throughout the area in either its development or specific expression, but certain characteristics are common to all of its buildings and periods. Building materials were simple: timber, stone, plaster, and sun-dried brick. Structural methods were, with a few conspicuous exceptions, relatively haphazard, crudities were simply hidden with plaster, and it was common practise to support heavy stone walls with timber beams. **Minoan architecture** reflects the refinement of a peaceful maritime people who had contact with Egypt but had great inventive ability and made their borrowings distinctly their own. The climactic expression of their architectural skill is found in the great palaces of Knossos, Phaistos and Gournia, each a vast complex of halls, chambers, courts, monumental stairways and open ceremonial places on various levels and functionally divided into well-defined areas. The ceilings of the large halls were supported on pillars and the walls were lavishly decorated with frescoes of remarkable quality; in these the life and ceremonies of court and people are vividly depicted; decorative and abstract patterns were drawn largely from the inhabitants of the sea, though flowers were also widely used for this purpose. The Cretan towns, haphazard in plan and unprotected by walls, were made up of closely built but comfortable flat-roofed houses, often of two or three stories and sometimes built around a courtyard; with mullioned and transomed windows and regular facades, these houses are quite modern in appearance and had sanitary conveniences of a practicability and luxury not again found in the ancient world until their re-invention by the Romans. Tombs were of four types: cist and pit graves, chamber and beehive tombs, the latter two of architectural significance because of their vaulted roofs.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

Religious architecture was largely confined to modest and simple walled shrines. On the mainland the most striking difference is seen in the massive megalithic fortifications with which the palaces of Mycenae, Tiryns, Troy and other cities were protected, but the most significant difference lies in the palace plans. The mainland palaces were centered on a large pillared hall with an open hearth at the center, the approach being through a porch *in antis* (q.v.) and a vestibule: the side walls of porch, vestibule and hall are continuous and the unit is called a **megaron.** This is not a Mediterranean type and is associated with primitive northern Europe, though its place of origin is still in dispute. In the larger palaces there are also subsidiary *megara,* presumably composing the quarters of the women of the chieftain's family and approachable only through the principal *megaron.* Decorative methods and details are the same as those in Crete, and in considerable part may have been executed by Cretan painters and craftsmen. The finest beehive tombs or **tholoi** are found on the mainland, notably at Mycenae and Orchomenos, where the masonry, carving and vaulting are of extraordinary refinement; except in these tombs, Mycenean stone work is generally megalithic, and ashlar masonry is found only in the latest levels at Troy.
—T.A.H.

**Aegean vases.** From the 4th to the 2nd millenium B.C., Crete was the center of a great commercial and artistic civilization (see Cretan-Minoan), in which the vases played an important part, both as objects of export and for local enjoyment. In the early Minoan period (3400-2100), small vase shapes of egg-shell thinness, with lovely brown and white and gray and white veining, were produced. The potter's wheel appeared in the Middle Minoan period (2100-1580). In this period the most important product was **Kamares ware,** graceful copies of metal vases, decorated with bold geometric and stylized floral patterns in a range of colors: white, maroon red, yellow and black. Three successive types of vases mark the Late Minoan (1580-1200); first, the finest ware produced in Crete, in which multitudes of naturalistic floral and marine forms were painted in dark glaze to give gay and spirited decoration to finely shaped vases; vases of the **"Palace Style",** in which the spontaneity and verve of the former period were supplanted by formalized patterns, which nevertheless have dignity and monumental character; and finally, after a disaster preceding the final downfall of Crete, inferior ware with crude geometric patterns. To Crete the Greeks were indebted for the potter's wheel, the lustrous black glaze which was the stock-in-trade of later potters, and decorative designs from the world of nature which were never surpassed in later times. Crete also produced carved stone vases during the early Late-Minoan period which are masterpieces of bas-relief, notably the Harvester Vase, picturing a happy harvest-home, and the Boxer Vase, with friezes of boxers and bull-fighters. These were carved in steatite and covered with gold leaf. Influenced by Cretan ware were potters and metal smiths in the Cyclades, notably Syros, Melos, Thera, and Rhodes, who carried on the Cretan tradition of decorative painting. —W.R.A.

**Aeginetan art.** During the fifty years preceding the conquest of Aegina by Athens (457 B.C.), that island was a center of art, which culminated in the temple of Aphaia (c. 500-480 B.C.). It was distinguished by skillful grouping of the human figure in pedimental decoration and by lithe, nervously energetic sculptural forms. —W.R.A.

**aegis.** The shield of Zeus and protective cloak of Athena were called by this name. In Greek sculpture and vase painting Athena was usually represented wearing a breast covering of this sort, decorated with a Gorgon's head in the center and serpents on the border. — W.R.A.

**aeolian harp.** A mechanical device in which moving air produces tonal effects from a set of stretched strings.

**Aeolian mode.** See idiom A(2).

**aerial perspective.** See PERSPECTIVE.

**aerial photo sketch.** See military sketch.

**aerial representation.** In East Asiatic art, especially painting, it is commonly used; a bird's-eye view. —J.A.M.

**aerugo.** See verdigris.

**aesthetic dance.** The name "aesthetic dance" was given to that style of dance taught in many professional studios and introduced into physical education curricula during the period from 1910 to approximately 1925. Aesthetic dance technique was a mixture of classical ballet technique and national dance steps all arranged in a formal and rigid system, to be taught with the discipline of formal gymnastics. This hybrid form was the result of

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

efforts to modify and enrich the system of classic ballet. These efforts probably grew out of the beginning reaction to ballet rigidity, and the need for a dance form acceptable in general education. —J.G.

**aesthetic form.** See form; form: a philosophical analysis.

**AESTHETIC INQUIRY, current types of.** Traditionally, aesthetics was that branch of philosophy dealing with beauty (q.v.) or the beautiful, especially in art, and with taste (q.v.) and standards of value in judging art; also, a theory or consistent attitude on such matters. Aesthetics is now achieving a more independent status as the subject (whether it is or can be a "science" is a disputed issue) which studies (a) works of art, (b) the processes of producing and experiencing art, and (c) certain aspects of nature and human production outside the field of art — especially those which can be considered as beautiful or ugly in regard to form and sensory qualities. (E.g., sunsets, flowers, human beings, machines.)

While not abandoning its interest in beauty, artistic value, and other normative concepts, recent aesthetics has tended to lay increasing emphasis on a descriptive, factual approach to the phenomena of art and aesthetic experience. It is by no means restricted to the question of what is good or beautiful in art. On the other hand, it differs from *art history,* archeology, and cultural history in stressing a theoretical organization of materials in terms of recurrent types and tendencies, rather than a chronological or genetic one. It differs from *general psychology* in focusing upon certain selected phases in psychophysical activity, and on their application to certain types of objects and situations, especially those of art. It investigates the forms and characteristics of art, which psychology does not do. It differs from *art criticism* (q.v.) in seeking a more general, theoretical understanding of the arts than is usual in that subject, and in attempting a more consistently objective, impersonal attitude. It maintains a philosophic breadth in comparing examples of all the arts, and in assembling data and hypotheses from many sources, including philosophy, psychology, cultural history, and the social sciences. But it is departing from traditional conceptions of *philosophy* in that writing labelled "aesthetics" now often includes much detailed, empirical study of particular phenomena.

Overlapping among all the above-mentioned fields is inevitable, as well as great difference in approach among individual writers. Some of these stress the nature and varieties of form in art, with attention to historic types and styles, such as romanticism, the baroque, etc., and in studying their evolution adopt the historian's viewpoint to some extent. Some stress the psychology of aesthetic experience; of artistic creation, taste, and imagination.

The progress of aesthetics toward scientific status is being slowly made along many lines, through increasing use of an objective and logical approach instead of a dogmatic or personal one, and through bringing the results of other sciences to bear on aesthetic problems. Recent years have seen a vast increase in the amount and variety of artistic data available for the aesthetician, as a result of anthropological and archeological research and excavation, diversified museum collections, improved reproductions, translations, and phonograph records.

It is misleading to use such terms as "experimental aesthetics", "comparative aesthetics", etc., as if they stood for distinct subjects or distinct divisions of aesthetics. They stand rather for somewhat different approaches to the same general field, for the choice of different special problems within that field, or for different emphases in dealing with them. All these differences are in degree only, and there is much overlapping. As a result of departmental specialization in universities, they are often magnified into wide gulfs in educational presentation, through the fact that courses, teachers, and professional organizations concerned with various phases of art and aesthetics have little relation to each other. With this in mind, we may distinguish the chief present emphases in aesthetics as follows:

(1) In **philosophical aesthetics,** stress is laid on basic and central problems of theory; especially on such traditional questions as the nature of beauty, artistic value, aesthetic experience, sublimity, etc., and on the relation of beauty to truth and moral goodness. Basic assumptions of past and present aesthetic theory are analyzed and criticized as to their internal consistency, apparent reasonableness, and consistency with current hypotheses in other branches of philosophy and science. Abstract dialectic or speculative generalization is often the principal method, with great concern for proper definition of basic categories, and with comparatively little direct examination of concrete data. Writing on aesthetics can, of course, embrace large amounts of concrete data and still be philosophical if these data come from varied sources, and if the aim is to

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

coordinate them. Recent philosophical aesthetics has shown a trend in this direction.

(2) In **comparative aesthetics,** stress is laid on the results of observation, especially of works of art. Periods, styles, individual artists, and particular works of art are systematically compared, so as to bring out significant resemblances and differences, recurrent traits, trends, and causal connections. Approximately the same field and approach are called in German ***allgemeine Kunstwissenschaft,*** or 'general science of art'. But this term has not become current in English-speaking usage, partly from fear of exaggerating the scientific status of present ideas on the subject. As distinguished from the "aesthetics of music", "aesthetics of poetry", "aesthetics of sculpture", etc. (which are concerned with theoretical issues in some particular art), *comparative* aesthetics involves comparison of the arts with each other, and study of types and factors entering into more than one art. (See form; presentation; suggestion; component; composition.)

(3) **Psychological aesthetics** is an approach to aesthetic problems from the standpoint of psychology. It emphasizes the nature of aesthetic experience; of human behavior toward works of art; the processes involved in artistic production and appreciation, especially perception, imagination, and emotion; the phenomena of taste and preference; the nature and determinants of special art ability; the growth of art ability (creative and appreciative) in children. It considers the application to art of special psychological theories such as empathy and psychoanalysis. In addition, it studies the forms of art from a psychological standpoint; their nature and varieties; the genesis of styles —all with emphasis on how these factors operate as expressions of human nature and as stimuli to human experience. The terms **aesthetic psychology** and **psychology of art** (q.v.) are sometimes used as equivalents for this approach or some phase of it.

(4) The term **experimental aesthetics** has been applied to a special type of psychological approach: namely, that which restricts itself to quantitative measurement, laboratory and statistical procedure. It follows the lead of Fechner, whose studies of aesthetic preference in 1876 helped to inaugurate modern experimental psychology as well as the empirical approach to aesthetics. It has dealt less with works of art than with preference for various arbitrary, simplified linear shapes, color-combinations and tone-combinations. This approach has also led to attempted scales and tests for measuring ability to create and appreciate art, especially in children. Broadly speaking, the term "experimental" applies to many other approaches and procedures in aesthetics, and this one could be more exactly described as **quantitative aesthetics.**

(5) **Sociological aesthetics** stresses the relation of art to social, political, and economic factors; to collective rather than individual behavior. It has been strongly influenced by Marx's theory of the economic determination of history, and sometimes by later socialism and communism; sometimes by fascism; but it is not necessarily prejudiced by any special belief or partisan spirit. It has emphasized the ways in which styles and tastes in art, and the characters and products of particular artists, are influenced by class and other socio-economic interests (see sociology of art).—T.M.

**aesthetic judgment.** See TASTE; AESTHETICS; art tests.

**aesthetic language.** See AESTHETICS.

**aesthetic psychology.** See PSYCHOLOGY OF ART; AESTHETIC INQUIRY (3).

**AESTHETICS** (Gr. *aesthetikos*, perceptive). The purpose of aesthetics is to discover the generic characterics of fine or beautiful art, and to determine the relation of art to other phases of culture, such as science, industry, morality, philosophy and religion. Understood in this way, aesthetics is sharply distinguished from the historical study of art, which is concerned, not with the essence of art, but with the filiation and development of styles and schools. Sometimes the scope of aesthetics is broadened to include the beautiful in nature and human life, but when this is done, it tends to lose definiteness of content, owing to the subjectivity of beauty in these fields; and, at all events, the preëminence of art as an embodiment of beauty is generally recognized. The term *aesthetics* was first used with its present meaning by Alexander Gottlieb Baumgarten in 1735, in his treatise *Meditationes philosophicae de nonnullis ad poema pertinentibus,* and later, in 1750, as the title of a book, *Aesthetica;* being derived from the Greek word *aistheta,* which means objects of sensuous as opposed to intellectual knowledge. The subject has been pursued chiefly by philosophers, but some of the most important insights have been contributed by poets and artists, such as Shelley, Goethe and Schiller, who have reflected on their own experience of creation and appreciation.

Two disciplines closely related to aesthetics in content and history are the psychology of

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

art and art criticism (qq.v.). The former, originating in the 18th cent. in connexion with British empiricism, is an investigation of the elements, pattern and context of the experience offered by the works of art. Since works of art become alive and actual only as they are experienced, the philosophy and the psychology of art overlap and have often been identified; yet the division of labor between them is clear; for the one is interested in the detailed analysis of the aesthetic experience for its own sake, while the other uses this information only so far as it contributes to a general conception or definition of the nature and purpose of art. For an adequate discussion of the problems and methods of the psychology of art see PSYCHOLOGY OF ART and the works cited in the bibliography given below. Here I would merely note that the study of the process called *Einfühlung* or empathy (q.v.) —the objectification of feeling and meaning into the colors, lines, shapes, tones, words and the like, which make up the sensuous media or 'surface' of works of art; and the study of the total state of mind during appreciation, yielding such concepts as 'aesthetic distance' and 'aesthetic repose', have been of especial value for aesthetics.[1] No less important has been the activity of art criticism, including its literary and musical species. Interest in a work of art seldom ends with lonely appreciation, but goes on to conversation with friends or written discussion concerning its comparative merit as judged by some implicit or formulated principle or expectation. Aesthetic judgments, esp. those of connoisseurs (q.v.), constitute, therefore, a material of primary relevance for aesthetics. The critics pass judgments on individual works of art; the aestheticians investigate their nature and validity; and, viewed from this angle, aesthetics is essentially a criticism of criticism.

Three general conceptions of art have dominated the history of aesthetics: **imitation, imagination,** and **expression** or **language.** The first was the gift of Plato and Aristotle, and has always found a naive, popular acceptance. It fits best the drama, painting and sculpture, where we seem to have before our eyes an image of visible nature and human action, as in a mirror. The Greeks, however, conceived of it so broadly as to cover even music, the rhythm and harmony of which, they felt, imitates moral character and other states of the soul.[2] But obviously in the practice of no one of the arts is exact or full imitation either possible or desirable. In order to be useful, therefore, the concept of imitation must be understood in some refined, philosophical sense. Historically, in fact, two chief revisions have been made. The earlier one was already introduced by Aristotle and was accepted by most Renaissance writers, according to whom art seeks to imitate, not all aspects, but only the general aspects of nature. This was significant because it gave to art the value of truth—philosophical, scientific or religious, according to the prevailing theory of reality. The later revision proposed that art imitates only the beautiful aspects of nature. Yet neither of these modifications of the concept of imitation suffices to save it from difficulty, for the universal applicability of each is questionable. There are, to be sure, works of art which express the generic aspects of existence; but there have been whole movements which, by contrast, have tried to express the unique, the momentary, even the pathological. Moreover, some works of art express 'truth', but not all. "Golden lads and girls all must / As chimney sweepers come to dust" does so; but "Hark, hark, the lark at heaven's gate sings" utters not truth, but the urgency of passion. And when art does express truth, it never expresses bare truth, but includes its feeling tones for the artist, as in the quotation from *Cymbaline;* never the mere concept, but the 'lure' of the concept. In other words, this reformed concept of imitation neglects the factor of personality, essential to art, and so fails to distinguish art from science. With regard to the beautiful in nature as the object of imitation, we may well ask with Diderot[3], "What is beautiful nature?" Is it, for example, an Italian landscape à la Poussin, or one such as a Brueghel painted? Is it the same as the noble, the aristocratic, or may it pertain to what is bourgeois, or of the peasant or workingman? If, on the other hand, as some have thought, the beautiful is a mere form or pattern, the artist can freely construct that without looking to nature for a model.

The shortcomings of the concept of imitation were already recognized in antiquity, most forthrightly perhaps by Philostratus, who asked how, if art be imitation, the sculptor can represent the Gods, whom no man has seen?[4] Does he perchance ascend to Olympus? That is to say, the artist is a creator, not an imitator; and for the capacity to construct novel forms, the term in general use since Philostratus employed it, has been imagination. Thus a rival view of **art as imagination** was born out of the problem of religious art. Very early in modern times, as early at least as Huarte, Bacon and Pallavicino,[5] in the late

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

16th and early 17th cents., certain important characteristics of imagination were noted: its kinship with dream; its contrast, nay opposition to reason. Eventually also it has been seen that those products of imagination which we call works of art constitute little worlds by themselves, with their own space and time, different from that of nature; with their own typical structure of organic unity, rhythm, contrast and climax, recurrence and variation of theme; full of their own values or satisfactions, derived indeed from the same springs as those of action, yet independent of action—a realm not of reality, but of appearance, of play. A one-sided emphasis on the make-believe character of art leads to the doctrine of art for art's sake (q.v.); its corrective lies in the acknowledgment of the element of truth in the theory of imitation—that imagination ceases to interest us permanently if it fails to concern itself with the problems of real life.

However, that art cannot be adequately defined in terms of imagination is clear by reason of the social character of the former and the private character of the latter. Art is in truth a dream, but a dream that can be shared. The outstanding merit of the concept of **art as language or expression** is that it takes care of its communicable nature. To say just when and through whom this view arose, is difficult. One can perhaps trace it to the studies instituted by the Greek rhetoricians, for we find in Aristotle the crucial distinction between descriptive and emotional expression, under which art was destined to be classed. Among modern thinkers, Condillac, Vico and Herder had definitely the conception of art as a species of language, and one hundred and fifty years later, Véron was to give this theory unequivocal statement.[7] For the purpose of defining art, three types of language may be distinguished — descriptive or propositional, practical and lyrical. The first is illustrated by a scientific treatise, the aim of which is the record and conveyance of information; the second by a command or entreaty, a sermon or a tract, the intention of which is directly to stimulate or inhibit action; the third is illustrated by a poem or musical composition, the end of which is the induction of a mood. But only music or the abstractionist painting of a Bracque or Picasso is purely lyrical; the language of the other arts is descriptive as well. Thus in poetry the words used, besides expressing feelings, designate objects or express generalizations, and in traditional painting the colored shapes have their meanings, as of houses or trees or the human form. Nevertheless in art the descriptive function of language is not separate from the lyrical; for in indicating objects or in expressing universals, the artist gives definition and communication to feelings which otherwise would be formless and dumb. Cézanne could not express his feeling towards Mont Sainte Victoire without representing it; Frost could not express his feeling towards the 'passage' of the good without telling us definitely that "Nothing good can stay." In this connexion it is interesting to note that the difference between what Charles Peirce called 'iconic' and conventional languages is relevant to aesthetics; poetry being an illustration of the latter; painting, sculpture and drama, since they mean objects by offering likenesses of them, illustrating the former. Iconic languages have a sensuousness and easy intelligibility lacking in the conventional, to compensate which, verbal language resorts to metaphor and other figures of speech. On the other hand, verbal language is better able to express generalizations (thoughts).

While the conception of art as lyrical language is enough to establish the genus, it does not suffice to establish the differentia of art. Two distinguishing characteristics of **aesthetic language** may be cited. First, in contrast with ordinary language, where the signs or symbols are transparent, attention centering on their meanings only; in art, they are opaque, attention lingering lovingly in them, because they are directly expressive on their own account. In poetry the words themselves, as mere sounds, related through rhythm, assonance, rime and melody; in painting and architecture, colored shapes, repeated, contrasted, balanced, rhythmically disposed, are expressive of vague moods, as music is. Without this music of the mere medium, there is no beautiful art, no matter how significant be the meanings attached. This is the fact expressed by Pater in his well-known statement that all art tends towards the status of music. It is also the ground of the doctrine known as formalism, according to which the form, or patterned sensuous surface, is the sole bearer of aesthetic value.[8] Yet this theory is certainly in error, for in our experience of art, form and content, surface and underlying meanings, interpenetrate, and to this entire structure, not to one factor only, beauty belongs.

A second distinguishing characteristic of aesthetic language is suggestiveness, the paradoxical property, noticed by Kant,[9] of permitting a plurality of meanings, without however incurring ambiguity. In ordinary language, on the other hand, an expression aims to have

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

a single meaning only, an ideal which it realizes perhaps in mathematics alone, but so far as it does not, is condemned. This contrast has been well put by saying that the ordinary expression is a 'unisign', while the aesthetic symbol is a 'plurisign'.[10] Of great importance in the case of art is the combination of a 'first' with a 'second' meaning, or as I would phrase it, of a 'surface' with a 'depth' meaning. Thus in the quotation from Frost, the word "gold" besides its obvious 'first' meaning, has the 'depth' meaning of valuable, and the entire phrase has the 'second' meaning, "nothing good abides". In such a poetic line as "The soul of Adonais like a star / Beacons from the above where the eternal are", the meanings are numerous, meaning beneath meaning. Every figure of speech is an example of a plurisign. Yet there is no ambiguity here, for all the meanings are relevant to the communication of the complex emotion of the poet, which requires them all for its definition. One might easily suppose that iconic languages were naturally unsignificant, but that is not so in the case of art. The representation of the shepherd and sheep, familiar in early Christian art, is evidently a plurisign, for besides its surface meaning it has also as depth meaning, a whole theory of the relation between God and man. And beneath the surface even of great landscape paintings and portraits, and of statues devoid of allegory, lie many layers of meaning for each spectator.

But although the conception of art as imagination needs to be supplemented by the conception of art as language, there is no contradiction between the two. For lyrical language induces in the artist and in his audience a state of mind akin to the dream, possessed of all the characteristics noted as pertaining to imagination. As a dream communicated, waywardness gives place to order and the assuagement of obscure desires fuses with the satisfaction of intelligible purposes. The best short definition of art remains therefore Shelley's, "the expression of the imagination", which unites the two points of view—of communication or language, and of the dream, self-sufficing and detached.

The approach to aesthetics by way of criticism belongs to modern times and has developed out of the prolific controversies of the critics, yet the seeds of later discussions may be found in Plato's *Phaedrus* and *Ion*, and subsequently in Horace, Plutarch, and Longinus. In his *Critique of the Aesthetical Judgment*, Kant was, I believe, the first to base aesthetic theory definitely on the **aesthetic judgment** rather than on the aesthetic experience. The problems have been two: whether aesthetic judgment or 'taste' is intuitive, a sort of 'sixth sense',[11] or rational, an affair of rules; and what constitutes the beauty or value of works of art to be appraised. The two problems are, however, clearly interconnected, for if beauty be a sort of unique flavor, a *'je ne sais quoi'*, it would not be susceptible of formulation, but only of immediate apprehension; while if, on the contrary, it be no different in kind from other values, it would be as capable of rational estimation as they are. Considering the tenacity with which each of these alternatives has been maintained by critics with large experience in the arts, it would be strange if there were not some truth in both. For, on the one hand, the fact that a work of art is an imaginative creation implies a surprising uniqueness defying rationalization in terms of any traditional or other scheme. Every original artist has claimed this, and the history of all the arts is a series of revolts. On the other hand, it is yet to be proved that the satisfactions derived from art are generically different from those of ordinary experience. If they are of the same kind, criticism will concern itself with two things: one, the interrelations of the elements of the work of art, of form and of content, with reference to the contribution of each to the total communicable value, yielding a strictly internal, or 'artistic', standard of perfection; and two, the importance of this value in the light of an accepted philosophy of values. Some students of aesthetics have contended that only the first type of scrutiny is relevant, but by far the larger proportion have recognized that since art is of man and for man, it cannot be held exempt from criticism according to the principles by which other activities are judged. If the religious or metaphysical values are the highest, then those works of art which give them expression in perfect intelligible form, are the greatest. Hence although the narrowly artistic is a necessary, it is not a sufficient criterion of excellence; and if the validity of a second, philosophical criterion is admitted, aesthetic criticism becomes an application of the general theory of value to works of art.

**aesthetics of children's art.** See CHILDREN'S ART.

**aesthetics of content.** See form: a philosophical analysis.

**AESTHETICS, recent trends in.** Croce's theory of lyrical intuition was the reigning aesthetic at the turn of the century and for some years after. His trenchant negations, setting off the peculiar value of art from those often confused with it, and his positive conception of the poetical imagination, still operate in the writings of men able to revise and apply freshly those insights: In *Principles of Art* (1938), R. G. Collingwood, the philosopher and archaeologist of Roman Britain, reveals the distance he has gone since his early Crocean *Outlines of a Philosophy of Art* (1925). Lionello Venturi (*History of Art Criticism*, 1936; *Art Criticism Now*, 1941) uses Croce's general definition of art as the postulate of his own specific art criticism and his evaluations of criticisms by others. Edgar F. Carritt has compiled an historical anthology of aesthetic theories (*Philosophies of Beauty*, 1931), and takes his own largely historical way of stating Crocean doctrine in *The Theory of Beauty* (4th ed. 1931) and then in the compact *What Is Beauty* (1932).

**Sciences of signs and symbols** have replaced Croceanism in the focus of attention. Three main directions have been taken: (1) **semantics**, the study of sign-situations, especially of verbal signs; (2) the psychological study of the sublimated dreams of art, the aftermath for aesthetics of Freud and Jung; (3) historical researches into icons as the most revealing manifestations of successive cultures.

(1) The chief writers under the first head are Messrs. Charles Ogden and I. A. Richards, and the scriptures of the school their *The Meaning of Meaning* (1st ed. 1923; begun in 1910; parts published in periodicals from 1920-1922). The wider purpose of the semanticists is to aid the process of verbal communication by producing awareness of the "frames of reference" during the act of meanings oriented in respect to each other. The uses of the school for aesthetics proper are illustrated by *The Foundations of Aesthetics* (Ogden, Richards, and Wood, 1922), in which sixteen different conceptions of beauty are fanned out, paralleled with pictures, and prepared for comparison by a statement of their respective frames of reference; also by the many chapters on the emotive use of language and on metaphor, and in the series of books on literary criticism by I. A. Richards: *Principles of Literary Criticism* (1925); *Practical Criticism* (1929); *Coleridge on the Imagination* (1934); *The Philosophy of Rhetoric* (1936); "The Interactions of Words," in *The Language of Poetry* (1942).

This first doctrine of signs and symbols is congruent with the favor now widely felt for rationalistic analysis and the relative disinclination for feeling and wholeness. D. W. Prall (*Aesthetic Judgment*, 1929, and *Aesthetic Analysis*, 1936) examines the basic orders in nature which "frame" the qualities of color and sound; C. J. Ducasse (*Philosophy of Art*, 1929) defines aesthetics as the science of the definitions of critical terms; R. W. Church (*An Essay on Critical Appreciation*, 1938) inquires into the meaning of the term beauty and defends intellectual criticism. Many writers on art, of a more technical sort, have followed the same trend. A large number of monographs have been written on the spatial frames, systems of perspective—or "rationalizations of sight"—implied or consciously devised by painters, sculptors, and architects, at various periods, e.g., Erwin Panofsky, *Die Perspektive als Symbolische Form* (1927); G. M. A.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

Richter, *Perspective, Ancient, Medieval and Renaissance* (1937); S. Giedion, *Space, Time, and Architecture* (1941): M. Bunim, *Space in Medieval Painting and the Forerunners of Perspective* (1940). In proportion as these frames and orders have been envisaged with measurable exactitude, there has been harmony with a tendency toward **mathematical aesthetics.** The latter is illustrated by the essays on *Dynamic Symmetry* by Jay Hambidge (1920) and by George Birkhoff's *Aesthetic Measure* (1933).

(2) But the terms sign and symbol have also had lately a markedly irrational connotation. Psychoanalysis focusses on emotion and content rather than on architectonic forms and definition-tracks; and on the creative process of the artist (Leonardo da Vinci; Goethe) rather than on the critical appreciative response. The artist is discovered to possess a soul peculiarly beset by archetypal human conflicts, e.g., those relating to sex and family rivalries, also those involving the trauma of birth (Otto Rank: *The Trauma of Birth,* 1924; *Art and the Artist,* 1932). Carl G. Jung (*The Theory of Psychoanalysis,* 1915; *Two Essays on Analytical Psychoanalysis,* 1926; *Psychology and the Unconscious,* 1916; *The Integration of Personality,* 1939) himself identified many symbols as dark psychic substitutes for a disturbing situation: water for the fluid depths of the soul; the world of Olympus, the myths of Œdipus, Narcissicism, the Sphynx, Prometheus, the Minotaur, Harpies, the gestures and postures of figures in statues and paintings for this or that biological fact. D. H. Lawrence (*Psychoanalysis and the Unconscious,* 1921, and *Fantasia of the Unconscious,* 1930) develops the doctrine in an imaginative rather than scientific fashion.

(3) The third exploration of the meaning of symbols has found expression in the large scholarly output of the Warburg Institute (23 German, 14 English volumes of "studies"; 9 volumes of "lectures"; and *The Journal of the Warburg Institute,* 1937-). Ernst Cassirer's volumes on the meaning of symbolic form, Erwin Panofsky's studies in Neo-Platonic backgrounds and of the evolution of the concept *Idea* in art-history, and Edgar Wind's inquiry into the relation of eighteenth-century portraiture to the philosophy of the period may be mentioned as typical. The postulates of this group include the repudiation of the opposition of "inner" and "outer" approaches to art and history; the claim that the best analysis is historical; and the contention that man's expression of his psychic energies and habits in artistic symbols can only be understood by a recognition of the interplay of religious, social, scientific, and artistic elements in any epoch.

As the Warburg scholars call themselves "humanists" in the Renaissance sense, a group of recent American writers sympathetic with John Dewey have also taken the title. They wish to "recover the continuity of aesthetic experience with the normal processes of living." But they lean rather on biology and direct observation of experience than on scholarly reconstructions (John Dewey, *Art as Experience,* 1934; Laurence Buermeyer, *The Aesthetic Experience,* 1924; Irwin Edman, *The World, the Arts, and the Artist,* 1928; Albert C. Barnes, *The Art in Painting,* 1928).

The first article in *The Journal of the Warburg Institute* "Sign and Symbol" was written by the Neo-Thomist Jacques Maritain. He and the English Catholic, Eric Gill, have presented an aesthetic theory in which rational and irrational elements are neatly fused. The dark base of creative activity is shifted from Freudian embryology to the energy of the Divine Being working in the souls of poets and all makers. St. Thomas's definition of art as craftsmanship — the right rule of things made — is used to explain the conscious part of the work of the artist.

The philosopher and psychologist Samuel Alexander developed in *Beauty and Other Forms of Value* (1933) a view of artistic creativity as rooted in the constructive instinct, the organic impulse becoming planned craftsmanship on the human level, and "fine art" through the joy of contemplation. Helge Lundholm's recent *Aesthetic Sentiment* (1941) acknowledges the influence of Alexander but replaces the constructive impulse by the sentiment of curiosity.

A rich crop of monographs on the history of taste (Beverly Sprague Allen, *Tides in English Taste, 1619-1800,* 1937; Frank P. Chambers, *The History of Taste,* 1932); and of general aesthetic texts (De Witt Parker, *Principles of Aesthetics,* 1920 and *The Analysis of Art,* 1926; Max Schoen, *Art and Beauty,* 1932; Louis Flaccus, *The Spirit and Substance of Art,* 3rd ed. 1941; Katharine Gilbert and Helmut Kuhn, *A History of Esthetics,* 1939); a general bibliography (William A. Hammond, *A Bibliography of Aesthetics and of the Philosophy of the Fine Arts from 1900 to 1932,* 2nd ed. 1934); and the inauguration of a *Journal of Aesthetics and Art Criticism* (ed. Dagobert D. Runes, 1942) testify to the present liveliness of aesthetic interest.—K.E.G.

Africanism. See AFRICAN NEGRO ART; AMERICAN NEGRO ART.

AFRICAN NEGRO ART. The controversy as to whether African Negro art was first appreciated by the ethnologist or the artist has raged since the beginning of this century in the literature of modern art. It is now an academic question; and the contention of the scientists that the appreciation of primitives only began after ethnological collections had been published in Europe seems of small significance against the fact that primitive styles of art have contributed more than the historical styles to the most modern aspects of contemporary art.

This controversy has installed two points of view, respecting the study of primitive art, which intermingle only at certain points. The ethnologist now maintains that African Negro art cannot be understood without first hand knowledge of its social, traditional and psychological backgrounds; while the art critic insists that first hand knowledge of the material culture and the primitive economy can have but little effect upon our responses to the admittedly great aesthetic appeal of the art itself. In general, ethnography treats art as one aspect of the *Kulturkreis* or social-cultural complex, following very closely the nature and distribution of industrial production. This approach has served well to distinguish the various important centers of production and to catalog their various phenomenal differences.

Art criticism, recognizing the present difficulties that beset scientific effort to arrive at some exact knowledge of the tribal cultures, takes the high ground of sensitive aesthetic appreciation and of psychoanalysis in determining the values and the place of African art in the general picture of world art. The chief drawback of this point of view is that its practitioners are sometimes led into half-mystical modes or attitudes of apperception when confronted with the necessity for explaining a work of art in terms of its function (see Ernst Fuhrmann, *Afrika,* 1922). It is thus difficult for art criticism, where it fails to make use of the findings of ethnology, to avoid the charge of reading into the artifacts of the primitives meanings and intentions that cannot be objectively demonstrated.

*The archaeological approach.* While archaeological method has its own ends and develops to some extent its own results, in respect to African art it stands as arbiter between ethnology and art criticism. The general contributions to our knowledge of African art have come through archaeological excursions in Africa. In the area of pre-history these excursions have been somewhat delimited in their results first by uncertainty as to the age and original locus of Negro man in Africa, and second, by the fact that archaeological investigation has been restricted largely to discovery and study of remains above ground.

Paleolithic and neolithic remains found in Libya, Southern Egypt and the Eastern Sudan, however, point to the possibility of an active proto-history for the Negro. In this connection the discoveries and observations of Leakey, Frobenius, Talbot, and Breuil are important; for they have introduced momentous possibilities into the general outline of the earliest beginnings and earliest true maturation of African Negro art. A line of emergence has been traced from the pictographic art of African neolithic times through the prevailing patterns and formal bias of certain proto-dynastic arts in Egypt, ancient Libya and the early African Atlantic settlements. Connection has likewise been made between ancient Zimbabwe in Southern Rhodesia and the early material culture of the Negroid Bantus of Southeast Africa. Frobenius has further traced the relation of early Sudanic and West Coast cultures to the ever-expanding influences and widely distributed products of the old Mediterranean civilizations; and he actually proves Greco-Phoenecian influence by the remains of stone altars, burial urns, and polychromed statuary, found throughout the so-called *Clay-complex* among the Ibibio and other tribal cultures in Nigeria.

*Origination and chronology.* Most of the African Negro art now in European and American collections is of comparatively recent origin, although the greater part undoubtedly bespeaks a group of continuous traditions extending backward in time as far as the first millienium, B. C. But very little is known of the true history of Negro Africa prior to the 15th cent., when both the West and East Coast districts were to some degree explored by Portuguese sailors. From some of their reports and from reports made by Dutch and later English explorers and tradesmen in the 17th, 18th and 19th cents., the Western world has gradually learned something of the Negro and his history. For periods prior to the 15th cent. in African art we must rely upon archaeological testimony bolstered by the historical writings of the Arab, Greek, Roman and Abyssinian travellers and historians who knew something at least of the

movements and settlements of peoples on the Mediterranean coasts of North Africa as well as in those fertile lands which lie contiguous to the Sahara.

It is certain that the main artistic traditions of Negro Africa go back as far as the 12th cent. A.D. if not to an earlier period. Frobenius sees in the highly developed art of the Ifé-Yoruba complex a beginning in the first millenium B.C.; for he postulates a definite culture contact between the Greco-Phoenecian and the Egypto-Sudanese-Hyllaean worlds in the archaic times of Greek civilization. If this be merely a fantastic theory, it is at least undeniable that the art of **Yoruba** and of **Great Benin** was well advanced as early as the 13th cent. A.D. On the basis of local traditions, Burton, who visited the Kingdom of Benin in 1862, dated the foundation of the dynasty at about 1150. Struck's chronology for Benin permits some systematic review of its art. He has assigned a series of round bells and a grotesque man to the *Archaic period;* to the so-called *Early period* belong some figured bases, a plaster head now in the Rushmore Museum, England, and a few bronze heads; while the *Golden Age* of Benin art (roughly between 1500-1702) brings into existence some excellent examples of bronze relief-work, some of which carry the figures of Europeans. To this period belong also some truly magnificent stylised portraits of young women. A further stylistic classification brings us down to 1650, when the decline of the Golden Age sets in, as is indicated not only by the adulteration of technical means but also by the greater coarseness in conception exhibited in the portraits and commemorative plaques of the period. To the *Late period* (1700-1800) of Benin art are assigned some wooden figures with brass-covered heads. These are clearly imitations of the bronze heads and plaques of a more luxurious day. From this is but a step to the poorly conceived and poorly executed work of the 19th cent. which fell under the influence of European naturalism and brought the wonderful technics of Benin bronze and brass casting to a very low level.

Ethnologists divide the Negro peoples of Africa into two groups: The Negroes proper and the Bantus. The former are characterized by physical similarity, although they speak different languages; the latter speak a common language with little variation, but show great physical variety. The mode of life of these two ethnic groups is in most respects the same; yet in its broad controlling patterns contains wide variations as regards the dominance of herding, hunting, agriculture or trade in the culture of the group. Similarly, the main artistic traditions of the Negro peoples are in certain of their aspects indistinguishable from one another; but we are able to locate their centers of production and to describe them as well with some reference to their antiquity so far as known.

The centers of production of African Negro art may be classified for purposes convenient for study into Guinea, including Liberia and Sierra-Leone and the Bissagos Islands; the Sudan; the Ivory Coast; Yoruba and Benin; Cameroon and Gaboon; the Gold Coast; and the Congo.

From the West and inner Sudan districts we have the art work of the **Bagafore, the Banmana, the Senoufo, Habbé** and **Mossi.** Here, the influence of ancient and modern Egypt is traceable in certain features of the masks and statuettes. No extant work from this region, unless of stone, is more than 100 years old. The exceeding dryness of the Sudanese climate has been cited as one cause contributing to the early decay of works executed in wood. The neighboring region, French Guinea, lies between the Sudan and the Atlantic Ocean. It supports the highly artistic and very productive tribes of the Baga and the Kissi. The former, posessing an art of extraordinary formal consistency, have not been indigenous to the region more than 200 years. The subjects as well as the forms that they employ, do antedate, however, the Mohammedan infiltration of the early 19th cent. The Kissi are credited with a special type of statuette made of steatite which serves the double purpose of ancestral image and heroic memorial to a dead tribesman. Of very crude facture, it strongly resembles in type and in function those carved wood monuments erected by the Konso peoples of Abyssinia (sometimes called Galla) whose use of similar commemorative statuettes has been traced 35 generations within a single locality.

Since we have already characterized the art of Yoruba and Benin, the **Ivory Coast** will follow by geographical position as the next center of production. The impressive Ivory Coast work is distributed among the **Baoulé,** the **Gouro, Dan** and other lesser tribes. Among these, the Baoulé who are a branch of the **Ashanti** peoples on the **Gold Coast** are the most advanced artistically. In point of execution as well as tasteful composition, their work is only equalled by that of the Banmana in the Sudan. Present specimens of Ivory

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

Coast work cannot be said to antedate the mid-18th cent. Characteristics of older Baoulé work are the carrying of the arms pinned to the sides of the body, elongation of the torso and exaggeration of the abdominal eminence. The representation of tribal scarification and the attachment of an artificial beard are other characteristics.

Many varieties of art work are found in the **Cameroon** which touches the southern border of the Sudan. Wood, brass, ivory and ceramics are found; and everything of this nature is produced by the men. The women are permitted to help with the house building. Drums, pipes, stools, drinking cups, basketry, masks and statuary are produced; and from the **Cross River** (s.w. Cameroon) come masks of strikingly realistic and distinctive quality which are said to represent the native conception of the male and female elements or sky-father and earth-mother.

Originally, the Cameroon cultures derived from that of the Yoruba-Benin complex situated to the West; but in the use of certain other types of decoration, such as strips of embroidered beadwork, is evidenced likewise a relationship with the Congo.

Among the **Ashanti** of the Gold Coast has arisen an interesting custom of making small brass weights for the measuring of gold dust. These weights, which are miniature sculptures translated into permanent material through the "lost-wax" process, are given many different and curious forms, illustrating proverbs and folk tales. This art reached its highest development among the Ashanti in the 17th cent.

In wood-carving the Ashanti have produced some very fine examples of maternity fetishes and stools which are employed by these people as the insignia of rank or class.

The antiquity of **Congo art** has virtually been settled by Torday and Joyce who have made a thorough study of the culture, economy and political organization of the Bushongo nation which dominates the Kasai administrative region of the Congo. The only Bushongo portrait statues known are 7 statues of chiefs which were created following a custom said to have been instituted by King Shamba Bolongongo, the national hero (ca. 1600). All these statues conform to a definite type, i.e., all are seated with legs crossed. They wear shoulder, arm and wrist bracelets and belts of cowries and fibre. Each carries his attribute (drum, anvil) before him. Individual, facial and bodily characteristics vary and the features are so designed as to compliment the general mass of the head. Possibly the only art of the Bushongo which antedates that of the sculptures is weaving, since the prevailing surface decoration of the plastic creations of this people obviously derives from textile designs.

The **Bushongo** nation itself has had its period of truly great efflorescence in modern times. The Bushongo were immigrants from the Ubangi-Shari region of Africa. They founded an empire which achieved ascendancy over a great area of Central Africa in the 18th cent. There are no other peoples in the Congo whose art can be referred to an earlier period than that of the Bushongo, nor is there any other type or form of sculpture among them that may be regarded as superior to their own.

*Varieties of art produced.* The corpus of African Negro art presents a limited repertory of subjects but an extensive vocabulary of styles and a great variety of technics. African art arises chiefly out of the religious customs of its producers, but runs a relatively long gamut of skills: It includes examples of monumental stone and wood and ivory carving, and also extends to the decoration of household and ceremonial utensils, notable in the art of the Bushongo tribes.

Clay-modelling, bronze, gold and brass casting reach in African art a truly magesterial splendor. The related technics of metalworking are also a skilled phase of native production; while bead, shell and other forms of ornamental embroidery, together with bark and raffia weaving, constitute a group of singular industrial arts among the Central African and West Coast tribes. In these several technics the Negro has made mask, figures, decorative and historical bas-reliefs, household and ceremonial utensils such as head-rests, stools, beds, king's sceptres and the batons of the chiefs, pottery of many kinds, weapons and gold assayers' weights, musical instruments, tobacco pipes, etc.

In architecture, however, little worthy of note may be attributed to the initiative of the Negro. In general, native African houses are of the simplest types and construction, the only exceptions being found in the now non-existent city of Benin where, wood, clay and metal were ingeniously used in the building of virtual palaces provided with terraces and elaborate colonnades. In Dahomey, the well-constructed clay-walled palaces of the kings resemble the shadowy low-roofed dwellings of the Fellaheen in Egypt. Ashantiland on the Gold Coast also contains some interesting specimens of native architecture. The best examples in this region recall in their total

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

effect and interior decoration the Greco-Roman houses of Pompeii of the so-called architectural style. The interior and exterior walls of the Ashanti dwellings sometimes carry geometric designs in relief which closely resemble Arabian fret-work of a geometrical order in wood.

*Portraitive qualities in African sculpture.* The true portrait rarely occurs in good African Negro art; but where it does occur it is of the greatest historical and iconographic importance for the reason that the actual documents of African Negro cultural history are few. If the portrait represents a known human being who once held high place in the tribal society, it may be of invaluable effect in determining the antiquity or age of the originating tribal culture, or, if not so much as that, at least the possible age of works of art. Thus, from the Bakuba in the West Congo region have come no less than nine portraits which have been identified as the portraits of different kings who at some time held powerful sway over the Bushongo nation.

The remarkable terra cotta and bronze heads of Ifé are evidently portraits of great princes and princesses who in their personalities were also regarded as divine by their subjects. Portraits of princely personages likewise come from Benin and Dahomey except that in the latter state they are treated in so symbolical a manner as to be devoid of actual traits of likeness. Portraits of Europeans appearing in African art enable us, where other substantiation is lacking, to identify more certainly the date and place of origin of those specimens of art work on which the portraits appear. For example, the portraits of Portuguese sailors on the bronze plaques of Benin allow us to determine the approximate date of their production by the Bini craftsmen.

By and large the portraitive quality in African art, even when it appears in identifiable portrait monuments, is formally generalizing rather than directly individualising in artistic intent; so that the tinge of realism that we have learned to look for in modern Western traditions of direct portraiture is usually absent from African sculpture which places unity of design and of mass above truth to individual expression.

*Plastic imagination and fantasy.* One of the most stimulating aspects of African art is its boldness in juxtaposing abnormal, grotesque or strikingly irregular shapes and forms to forms normally perceived and logically developed. This phenomenon is the basis of that ingenuity of presentation which we recognize as superior plastic imagination combined with primordial aesthetic feeling in the best primitive art. Various attempts have been made to explain these effects of African artistry on the basis of the interdependence of art and religion in the tribal spiritual life as well as on the more dubious ground of pre-logical mentality. To be sure, some of it can be thus accounted for, taking into consideration the greater or lesser vitality of totemism, animism and other primitive beliefs and practices among the art-producing cultures.

Theories proceeding on these primary assumptions usually fail to explain the use of grotesque or fantastic masks and statuettes in connection with ceremonies that have purely practical connotation with reference to the social structure of the tribe. Among the Baluba, the Bayake and the Mendi, there are war dances requiring the use of masks which so caricature the human features as to reach extremes of grotesque fantasy. But the motive for their creation was more practical than spiritual. Nor are the plastically rich and subjectively varied patterns of the Angola tobacco pipes to be accounted for merely on grounds of religious fantasy and pre-logical imagination. It is also true that some Negro tribes exhibit greater plastic imagination in their art than other tribes of the race. Yet, it is certain that the best traditions of African art are those which developed in areas where the tribal power and customs were sufficiently stable to exert formative influence on the artist. The rest was left to the artist's instinctive realization of the all-important truth that no effect of art is impressive which does not radically transform the object.

*Influence on Modern Western Art.* About 1904 African Negro art became known to several artists working in Paris. The revolutionary trend in European art initiated by the painting of Cezanne, of Gauguin and of van Gogh had prepared the artist for the reception and appreciation of African art as one of the major traditions of world art. For a generation or longer there had been working in the collective mind of the progressive spirits of artistic Europe a movement of reaction in favor of primitive feeling and modes of vision. It was therefore what African art (regarded by them as "primitive") could do to help clear the way for ideationally free and technically unfettered expression that was valued in its discovery by the artists of France and Germany.

The specific relationships of African art

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

to the art movements of the 20th cent. can be studied in the earlier phases of French Fauvism (q.v.) and cubism (q.v.) and in German expressionism (q.v.). After the discovery of Negro sculpture in Paris by Maurice de Vlaminck in 1904-05, the primitivistic trend in European art became more aggressive. It was taken up by André Derain and Pablo Picasso. The latter knew Ivory Coast masks and figural sculpture, and in his early cubist phase the influence of this region is most apparent. Henri Matisse, Georges Bracque, Modigliani, Constantin Brancusi (Hungarian sculptor), and Jacques Lipschitz (Russian sculptor), were all more or less influenced by examples of African art.

In Dresden, Germany, under the compelling leadership of Ernst Ludwig Kirchner, certain painters, now conveniently represented in the history of art under the generic term "Expressionists" (cf. Ernst Ludwig Kirchner, *Chronik der Brücke,* privately printed, 1916), introduced forms and effects of color into their painting (1906-1915) which convey the plastic yearnings of civilized humanity.

The general aesthetic yield of this extraordinary contact with African art must be considered in relation to the return of modern artists to those essentials of representation and design which may be regarded as fundamental to all artistic expression. Such terms as "instantaneousness", "intensity" and "dynamic forms" as used by these artists are indicative of the new aesthetic objectives which African art helped to release into the stream of organic Western art. In short, the progressives of the 20th cent. had set out to recover all that which academicism (q.v.) had tried to smother under many layers of outworn classico-romantic subject matter and technical recipes of the studio. **Aghlabid style.** See ISLAMIC ART.

**aging.** Process of allowing clay to age, accelerating colloidal degeneration. See CERAMICS I.

**Agni** (Skr. fire). Vedic god of fire; most important of Vedic gods, represented by color red and conceived of as having two heads, each containing a split tongue.

**Agnus Dei.** The last division of the musical Mass (q.v.).

**agoge.** *Mus.* The rules of melodic succession.

**agoge rhythmica.** The succession of tones with reference to accent and rhythm.

**agogic accent.** *Mus.* A sign over a note denoting the slight prolongation of its value required to mark the measure-motive's culminating point.

**agogics.** *Mus.* Slight duration variations in tone-duration, other than note-values; equivalent to dynamic variations in tone intensity. Modifying strict tempo to bring out the full expression of a musical phrase.

**agora.** The Greek and Roman name for a marketplace. In Hellenistic and Roman times it was often enclosed partially or wholly by porticos. The most famous agora of ancient times, that of Athens, has been excavated since 1927 by American archaeologists; important architectural remains, sculpture, coins and inscriptions have been found there. —W.R.A.

**agrèmens.** *Mus.* French term for graces, ornaments. See embellishments.

**Agrigentum.** This Sicilian site (called Akragas by the Greeks) was a center of culture in the

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

5th cent. B.C., famous esp. for its Doric temples, of which the most important were the temples of "Herakles" (c. 510 B.C.), Zeus Olympios (c. 470 B.C.), "Juno" (c. 470 B.C.), "Concord" (c. 440 B.C.), and the Dioscuri (c. 250 B.C.). —W.R.A.

**Ahavah Rabbah mode.** See JEWISH MUSIC.

**Ahriman** (Per.). In Zoroastrianism, the evil spirit.

**Ahura-Mazda.** See Ormazd.

**air.** A tune, melody, song. A rhythmical, melodious series of single tones in a metrical group.

**air-jet.** See ACOUSTICS; MUSICAL INSTRUMENTS.

**Ajax.** A Greek hero in the Trojan War, famous for his great strength and tragic suicide. The Italian sculptor Canova included him among his portrayals of mythological subjects. —W.R.A.

**Akahada pottery** (Jap.). Pottery made in the province of Yamato.

**Akkadian art.** See MESOPOTAMIAN ART.

**Akogi yaki** (Jap.). Pottery made in Ise province.

**Akragas.** See Agrigentum.

**akroterion.** See acroterium.

**alabastron.** A small Greek perfume vase, with delicately curved sides and a bottom rounded so that it had to be supported to stand upright. —W.R.A.

**à la Grecque** (Fr.). In the Greek style. Having the character of Greek art due to strong Grecian influence.

**à la mode** (Fr.). Pertaining to the current style or fashion.

**alba.** See MEDIEVAL MUSIC.

**albarium** (Lat.). A thin stucco, white.

**Alberti bass.** Accompaniment for the left hand after the style of Domenico Alberti of Venice.

**Albumblatt, album-leaf.** A short lyrical instrumental piece.

**album paintings.** Paintings and graphic prints were sometimes made small in size to mount in albums; picture albums. —J.A.M.

**alcarazza** (Sp.). A porous earthenware receptacle.

**alcazar** (Sp.). Fortress; also palace.

**alcohol.** Either as the pure spirit, made by distillation of grains or fruits, or as a distillate of vegetable waste, particularly wood, alcohol has a limited use in the arts as a solvent for resins and as a general cleaning agent. It is found in some quantity in a few of the picture varnishes and almost as the sole agent for those materials used as fixatives for drawings. There it is combined with a soft resin or, in some cases, with a synthetic resin. Alcohol has been known probably since the 9th cent. but any extensive use of it in the arts has been during comparatively modern times. —G.L.S.

**Alcora pottery.** See SPAIN, ART OF.

**alcove** (Sp. *alcoba,* bed-chamber). A covered recess connected with, opening into, or at the side of a larger room. —J.M.M.

**Alexander the Great.** King of Macedon (356-323 B.C.) and "world-conqueror." His court sculptor was Lysippus, chosen because he succeeded best in portraying Alexander's "masculine and leonine appearance." Several extant busts of Alexander are doubtless copies or adaptations of Lysippus' work, notably the Azara bust in the Louvre and one in the British Museum. Perhaps more trustworthy representations are those on Macedonian coins of the period. —W.R.A.

**Alexander the Great, sarcophagus of.** A sarcophagus found at Sidon, and now in Constantinople. It is perhaps the most beautiful of all classical sarcophagi, as well as an outstanding work of 4th cent. B.C., relief sculpture. Its top is in the form of a temple roof, and the reliefs on the sides are framed by exquisite carved mouldings. The sculpture, embellished with delicate red, blue and yellow color, represents dramatic battle and hunting scenes, with Alexander the Great playing a prominent role. H. Bey and T. Reinach, *Une necropole royale à Sidon.* —W.R.A.

**Alexandrian art.** See HELLENISTIC ART; EARLY CHRISTIAN ART.

**alhambra.** Usually a counterpane fabric, with fine warp and coarse filling threads. Jacquard figuring. This fabric resembles the hand loom woven bed covers made in New England in the 18th cent. —G.W.R.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

**alizarin.** One of the coloring materials in the pigment madder, alizarin has been isolated and synthesized since 1868 when C. Grave and C. Lieberman reported its discovery. Since that time it has largely replaced as a pigment the naturally derived coloring matter from the madder root. It is a deep crimson and varies somewhat in hue according to its manufacture. It is one of the lake pigments, being a soluble dye precipitated on a base, usually aluminum hydrate. Like all such lake colors, it is highly transparent. In its reaction to light it is more stable than the natural madder. —G.L.S.

**alkaline glass.** See GLASS AND GLASS-MAKING.

**alla-breve.** See NOTATION .

**alla prima** (It.). In painting, the process of laying on all the pigments "at once"; i.e., a single application of the pigments rather than several in layers.

**allée couverte** (Fr.). A covered passage. A tunnellike entrance to an ancient tomb.

**allegory.** The use of images to represent abstract concepts and their relations, provided that to represent means "to stand for and instead of", not merely "to iliustrate and to confirm". Such use is a reversal of ordinary mental processes in which images accompany and exemplify relationships of meaning operative on the basis of words and valid even without help of images. To speak of love, of its causes and its manifestations is to speak in terms of ordinary discourse, which emphasizes the relations of ideas; to speak of "lady love", her fate and her exploits, as medieval poets did, is to speak in terms of allegory, which emphasizes the relations of the sensuous embodiments of ideas.

Legitimate means of allegory are: (1) *personification,* such as the replacement of "love" by "lady love" or of "justice" by a blindfolded lady with a balance in her hand; (2) *exemplification,* such as the replacement of "justice" by a judge in the act of dispensing justice or by a judge well known in history such as king Solomon. Both methods are frequently used conjointly, which is all the more desirable, since no personification can act as such without some attribute, special character or inscription to confer upon it its identity.

Allegory claims the virtue of being able to invite the mind to contemplate metaphysical essences such as love and justice in their objective being apart from whatever relation they may possess to individual human experience. Therein lies its pedagogical value for those not trained in abstract thought as well as its danger for the pursuance of such thought. For allegory can only summarily point to abstract concepts without providing the tools for unraveling them. The task of allegory is to isolate universal concepts; it therefore is not its proper business to render as art does the complexities of individual experience which it could only imperfectly approximate by accumulating universal referents. Its range is further restricted by its being able to act as a visual substitute only for disconnected nouns, not for the verbs and predicates which we use as signs for relationships between nouns. The numerous and necessary relations between allegorical terms can consequently not be allegorical. The actions and gestures of allegorical figures (such as the battle between vices and virtues) are all symbolical and so are those spatial relationships which indicate their relative place in the hierarchy of concepts (such as the relation of "above" and "below" to indicate rank, or of "center" to "periphery" to indicate importance). It must finally be pointed out that the legitimacy of the claim of personification that it "represents" abstract concepts is open to question. If, as we assumed, to "represent" means to "stand for or instead of", then it is clear that no attribute can make the figure of a woman stand for or instead of a metaphysical principle.

Historically allegory is an invention of the ancient Greeks and a mode of representation exclusive to European civilization. It arose when Greek rationalism began to interpret the ancient mythological figures as embodiments of philosophical truths. It gained ground when Christian monotheism abolished the ancient divinities only to readmit part of them in the guise of allegorical personifications. Its permanent establishment is due to the so-called "realism" in medieval philosophy which upheld the reality, distinctness and separate existence of universal concepts. Under the influence of such philosophy the medieval mind was not only able to create novel allegorical entities, but it implanted the use of allegory so firmly in the European mentality, that no subsequent change in philosophy was able to dislodge it. —R.B.

**allegro.** Rapid tempo. See adagio (1).

**alleluia.** In church-music, an acclamation added to the end of a psalm or other item in the ritual. See Mass; MEDIEVAL MUSIC.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

**allemande.** One of the *pre-classic* dance forms; was an ancient dance of the German people which found its way into 16th cent. French court life and thence to the rest of the Continent and to England. Its popularity must have been great, since its name and general style survive today in certain English and American square and round dances. The earliest allemande was done in slow, heavy, 4/4 meter and with simple movement. Its characteristic figures, danced with hands joined or arms linked throughout, produced an intertwining flow of motion. Court dancers exaggerated this quality to an over-graceful sentimentality. The court form was divided into three parts with couples moving in a column. An unusual feature was the pause for conversation between the first and second parts. The 3d part became much lighter and livelier than it had been in the ancient dance. German composers substituted the allemande music for that of the pavane as the opening piece in the instrumental suites based upon the court dances, and this substitution later became accepted in general suite composition (see pavane). —J.G.

**allgemeine Kunstwissenschaft.** See AESTHETIC INQUIRY (2).

**allotments.** See CIVIC PLANNING.

**allusive arms.** See HERALDRY.

**almemar.** Platform in the Jewish synagogue (q.v.) on which is located a reading desk.

**Almohad art.** See ISLAMIC ART.

**Almoravid art.** See ISLAMIC ART.

**alms bowl.** See SYMBOLISM IN FAR EASTERN ART.

**Alpaca cloth.** A thin cloth usually made of mohair.

**alpaca yarn.** Often used to refer to yarn used in rayon alpaca cloth. Misnomer.

**alpenhorn.** A wooden trumpet used by Swiss shepherds.

**alpha and omega.** The first and last letters of the Greek alphabet. (Rev. I, 8; XXI, 6; XXII, 13.) Frequently used in art as symbols of omnipotence. —L.L.

**alphabet notation.** See NOTATION.

**alt, altissimo.** *Mus.* High, highest. *Alt* notes begin with the g above the treble staff; altissimo notes are an octave higher.

**Altamira art.** See PREHISTORIC ART.

**altar** (Lat. *altare,* from *altus,* high). A high place, that is, a place of highest honor; more precisely, a pedestal (fixed or movable) used for supplication, invocation of, or sacrifice to a deity, deified hero, or saint. As supplication and sacrifices are common to most religions, the altar has been used generally by nations and peoples throughout the world.

The altar has always been closely associated with the actual presence or manifestation of the deity or saint, the place in which he abides, upon which he stands, which holds his relics, or which stands before his abode.

Earliest altars seem to have been mounds or platforms of sunbaked earth or large stones; however the development into more ornamental forms was rapid. Altars of various forms and materials were used in Egypt and Mesopotamia from the earliest times. In Assyria limestone and alabaster were used, while in Egypt basaltic rock and polished granite were the chief materials.

At Knossos, Crete, an altar was found consisting of a slab of black steatite supported by four legs at the corners. This was placed as a cover for a sacred stone (***omphalos***).

The early altars of the Hebrews were of the simplest material. This was required by priestly regulation (Exodus xx. 24). Later, two forms were recognized, the first for burnt-offerings, the second for incense. The **Altar of Burnt-Offering** was placed in the center of the temple (tabernacle) court, and was made of acacia wood covered with copper or brass. The corners were decorated with protruding forms called "horns." (Exodus xxvii. 1-8; I Kings i. 50; I Kings ii. 28.) (Similar forms are seen in the altars of Assyria and Crete.) The **altar of incense** stood in the holy place of the temple. Likewise it seems to have been made of wood, possibly cedar, smaller than the altar for burnt-offering, and also covered with metal, probably gold.

In classic Greece and Rome two types appeared, dependent upon use. The first type included those placed within temples before the image of the god. They were small low pedestals or platforms upon which the worshiper could kneel. The second type was larger, in the form of a table or pedestal, and was designed for offerings or burnt sacrifice. This type was placed in the open air, and if used in connection with temple worship, it stood before the principal entrance (in Greece, the east front). The size, shape, material, and decoration varied greatly, but the usual altar

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

was of modest dimension, round or rectangular in plan, and built of marble. Notable exceptions in size are the altar of the Temple of Zeus and Athena at Pergamon, built by Eumenes II in the first half of the 2d cent. B.C., and the heroic altar of Augustan Pace in Rome, dedicated in 9 B.C.

The first Christian meeting places seem to have had no altars (probably because of pagan association). The communion or Eucharistic Feast probably was celebrated on a movable wooden table. The table-like tombs of the catacombs may have served this purpose, but the fact is not established, though the decree of Pope Felix I (A.D. 269-274) requiring that the mass be celebrated above the tombs of the martyrs strengthens the supposition. By the end of the 3d cent., however, the altar was being used. In western Europe and England wooden altars were customary until the 11th cent., although stone and marble were used in the Mediterranean countries as early as the beginning of the 4th cent. There are records of altars of gold or silver, probably referring to the use of these metals to form a decorative covering for the surfaces either in whole or in part. The ***altar cover*** (***palliotto***) given in A.D. 835 by Archbishop Engelbert to the Basilica of Sant' Ambrogio, Milan, is an existing example. It covers the four vertical faces of the altar and is made of sheets of gold, silver, and silver gilt with designs in engraving and relief, with added decoration of enamels, cameos, and precious stones.

The developed altar of the medieval church consisted of (1) the table (***mensa***), which was usually a stone slab generally marked with five crosses as a sign of its consecration; (2) the support (***stipes***), a solid mass of material or a series of piers or columns (usually four); and (3) the altar cavity (***sepulchrum***), which contained the relics, a practice probably developed from the aforementioned decree of Felix I. The step or base (***predella***) on which the altar stands often is considered a part of the altar. This is in accord with the use of the altar as a platform upon which the supplicant kneels. The decree that the mass should be celebrated above the tombs of the martyrs may have led to the multiplication and placing of the altars. If several martyrs were buried in close proximity, each would have an altar. This practice led to the side altars dedicated to various saints.

When a church has more than one altar, the principal one is called the **high altar.** This may be placed against the rear wall of the chancel or isolated in the body of the church. (The position of the isolated high altar varies, dependent upon local and national ritualistic custom.) The general practice in the Italian cathedral church with developed transepts places the high altar at the crossing (that is, the intersection of nave and transepts); in the French cathedral, toward the rear of the choir; in the Spanish cathedral, toward the rear of the nave, the front portion being occupied by the choir. There are many exceptions, however. The rules and practices relating to the use and decoration of the altar are complex and vary at different times, but its primary purpose is to provide a place for the consecration of the Eucharist and the celebration of the Eucharistic feast, and in the Roman Catholic Church it should contain a holy relic.

**Movable or portable altars** have been used commonly. The description of the Hebrew altar of burnt offering speaks of rings on its sides through which staves may be passed in order to transport it. (Exodus xxvii. 1-8) Small blocks of limestone bearing dedications to deities have been found in the classic lands and Mesopotamia. The use of **"pocket" altars** still prevails in India. Since the 7th cent. A.D. portable altars have been used in Christian worship. These altars are usually slabs of hard stone which are consecrated and marked with the five crosses. They may be set upon any material available at the place where the use of the altar is desired. Since late Gothic times portable altars have also been formed by altarpieces removed for the occasion, or by a painted panel in the form of an altarpiece (q.v.). This form was preferred because of its light weight and relatively small mass, enabling ease of transportation.

In the ancient civilizations of the Americas the altar was of the usual table-like form, either round or square, and usually decorated with symbolic sculptural relief or inscriptions in the form of glyphs. Sizes varied, but the altar stones were relatively low. At Piedras Negras, Guatemala, a square altar measures 6 by 6 ft.; at Cobá, Mexico, a round altar has a diameter of 4 ft. Both altars are only 18 inches high. Dates are uncertain. See R. A. S. Macalister, Altar, *Encyclopaedia Britannica,* 11th ed.; Sir A. Evans, *Palace of Minos at Knossos,* 1923; S. G. Morley, *Inscriptions of Peten;* Thompson and Pollock, *Preliminary Study of the Ruins of Cobá,* Carnegie Institution of Washington, D. C.; G. M. A. Richter, *Sculpture and Sculptors of the Greeks,* 1929.
—J.C.

In southwestern archaeology: Sometimes termed the "deflector" or "fire screen". (Some

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

archaeologists believe the "ventilator" served to conduct air into the chamber and that the "screen" or "deflector" was constructed or placed to prevent the incoming current of air from blowing directly onto the fire. Others are of the belief that the so-called "ventilator" was thought to be the entrance and exit of the spirit beings and that the so-called "deflector" was an "altar"). —J.M.M.

**altarpiece.** A decorated screen, panel, or series of panels, movable or fixed, placed upon or to the rear of an altar, generally incorporating paintings or sculpture in relief. (See also reredos; retable.)

The altarpiece as it is generally understood is peculiar to the Christian Church, though its counterpart may be seen in the wall carvings and painted banners at the shrines of the Buddhist and related faiths.

Few altarpieces are recorded prior to the 11th cent.; yet the elaborate design and technique of such examples as the "Palo d'Oro" of San Marco, Venice (11th cent., later restored and added to) indicate an earlier development, at least in the Eastern Roman Empire (Byzantine). The altarpiece of the Gothic period (13th and 14th cent.) was usually a group of hinged panels, a **triptych** of three panels or a **polyptych** of five or more panels, so arranged that the outer sections or wings would fold over the inner sections. The panels were pictorially treated, the principal subject appearing on the face of the inner panel or panels, related subjects or a continuation of the principal subject appearing on the outer panels. The back of the panels might also be painted, depending upon the placing and nature of the altarpiece. When this was done, the panels usually were divided into a series of smaller pictures. Where the panels were fixed rather than hinged, the same formal appearance was retained. The major panels usually were mounted, or appeared to be mounted, upon a step or base called the *predella* in the manner of the altar (q.v., movable) and itself decorated by a series of small paintings or carvings usually related in subject to that of the main panels. The *predella* was often included in the design of the frame and thus became an integral part of the altarpiece rather than a base supporting it. Frames were as elaborate as conditions permitted, usually of wood carved and gilded. Spaces upon the frame formed by the carved design were often treated with supplementary painting. Examples: single panel, *San Trinita Madonna* (13th cent.) by Cimabue, Uffizi, Florence; *Majesta* (14th cent.) by Duccio, Opera del Duomo, Siena; triptych form, *San Ansiano Annunciation* (14th cent.) by Simone Martini, Uffizi, Florence.

During the 15th cent. the Gothic forms were replaced gradually by the more typical Renaissance form of a single main panel, divided, however, into three (triptych form), under which in the base of the frame were the *predella* pictures. Examples: multiple panel, folding wings, St. Bavon (Ghent) altarpiece, *Adoration of the Lamb* by Hubert and Jan van Eyck; triptych form, San Zeno altarpiece by Mantegna, San Zeno, Verona, and the Frari altarpiece by Giovanni Bellini, I Frari, Venice; single panel with *predella, Coronation of the Virgin* by Fra Angelico, Louvre, Paris; single panel, *Nativity* by D. Ghirlandaio, Chapel, S. Trinita, Florence.

The altarpiece of the 16th cent. and later more often was a single picture attached to a wall behind the altar or set into an architectural frame. These altarpieces became quite elaborate in the Baroque era, often combining in extravagant design architecture, painting, and sculpture. Examples: *Sistine Madonna* by Raphael, Dresden Art Gallery; *Assumption of the Virgin* by Titian, Frari, Venice; Altar of San Ignazio, Gesu, Rome.

Special forms of the altarpiece are seen in the **reredos** and **retable.** In Gothic England and Spain these forms, usually combining architecture and sculpture, reached huge proportions, sometimes filling the entire rear wall of the chancel. This form, using both painting and sculpture, is typical of the late Renaissance in Spain and its colonial empire in the Americas. Examples: Capilla de los Reyes, Cathedral of Puebla, Mexico, and the Seminario de San Martín at Tepozotlan, Mexico. See Spanish Architecture in the New World. —J.C

**alteration.** See MEDIEVAL MUSIC.

**altered chord.** Chord formed by chromatic alteration of one or more tones of a major or minor triad.

**alternating coursed.** Term applied to masonry in which two heights of stone alternate in regular manner.

**alto.** See alt.

**alto clarinet, flute.** See MUSICAL INSTRUMENTS.

**alto-rilievo** (It.). High relief; sculpture in high relief. See relief; relief sculpture.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

was of modest dimension, round or rectangular in plan, and built of marble. Notable exceptions in size are the altar of the Temple of Zeus and Athena at Pergamon, built by Eumenes II in the first half of the 2d cent. B.C., and the heroic altar of Augustan Pace in Rome, dedicated in 9 B.C.

archaeologists believe the "ventilator" served to conduct air into the chamber and that the "screen" or "deflector" was constructed or placed to prevent the incoming current of air from blowing directly onto the fire. Others are of the belief that the so-called "ventilator" was thought to be the entrance and exit of the spirit beings and that the so-called "deflector" was an "altar"). —J.M.M.

**altarpiece.** A decorated screen, panel, or series of panels, movable or fixed, placed upon or to the rear of an altar, generally incorporating paintings or sculpture in relief. (See also reredos; retable.)

The altarpiece as it is generally understood is peculiar to the Christian Church, though its counterpart may be seen in the wall carvings and painted banners at the shrines of the Buddhist and related faiths.

Few altarpieces are recorded prior to the 11th cent.; yet the elaborate design and technique of such examples as the "Palo d'Oro" of San Marco, Venice (11th cent., later restored and added to) indicate an earlier development, at least in the Eastern Roman Empire (Byzantine). The altarpiece of the Gothic period (13th and 14th cent.) was usually a group of hinged panels, a **triptych** of three panels or a **polyptych** of five or more panels, so arranged that the outer sections or wings would fold over the inner sections. The panels were pictorially treated, the principal subject appearing on the face of the inner panel or panels, related subjects or a continuation of the principal subject appearing on the outer panels. The back of the panels might also be painted, depending upon the placing and nature of the altarpiece. When this was done, the panels usually were divided into a series of smaller pictures. Where the panels were fixed rather than hinged, the same formal appearance was retained. The major panels usually were mounted, or appeared to be mounted, upon a step or base called the *predella* in the manner of the altar (q.v., movable) and itself decorated by a series of small paintings or carvings usually related in subject to that of the main panels. The *predella* was often included in the design of the frame and thus became an integral part of the altarpiece rather than a base supporting it. Frames were as elaborate as conditions permitted, usually of wood carved and gilded. Spaces upon the frame formed by the carved design were often treated with supplementary painting. Examples: single panel, *San Trinita Madonna* (13th cent.) by Cimabue, Uffizi, Florence; *Majesta* (14th cent.) by Duccio, Opera del Duomo, Siena; triptych form, *San Ansiano Annunciation* (14th cent.) by Simone Martini, Uffizi, Florence.

During the 15th cent. the Gothic forms were replaced gradually by the more typical Renaissance form of a single main panel, divided, however, into three (triptych form), under which in the base of the frame were the *predella* pictures. Examples: multiple panel, folding wings, St. Bavon (Ghent) altarpiece, *Adoration of the Lamb* by Hubert and Jan van Eyck; triptych form, San Zeno altarpiece by Mantegna, San Zeno, Verona, and the Frari altarpiece by Giovanni Bellini, I Frari, Venice; single panel with *predella, Coronation of the Virgin* by Fra Angelico, Louvre, Paris; single panel, *Nativity* by D. Ghirlandaio, Chapel, S. Trinita, Florence.

The altarpiece of the 16th cent. and later more often was a single picture attached to a wall behind the altar or set into an architectural frame. These altarpieces became quite elaborate in the Baroque era, often combining in extravagant design architecture, painting, and sculpture. Examples: *Sistine Madonna* by Raphael, Dresden Art Gallery; *Assumption of the Virgin* by Titian, Frari, Venice; Altar of San Ignazio, Gesu, Rome.

Special forms of the altarpiece are seen in the **reredos** and **retable.** In Gothic England and Spain these forms, usually combining architecture and sculpture, reached huge proportions, sometimes filling the entire rear wall of the chancel. This form, using both painting and sculpture, is typical of the late Renaissance in Spain and its colonial empire in the Americas. Examples: Capilla de los Reyes, Cathedral of Puebla, Mexico, and the Seminario de San Martín at Tepozotlan, Mexico. See Spanish Architecture in the New World. —J.C

**alteration.** See MEDIEVAL MUSIC.

**altered chord.** Chord formed by chromatic alteration of one or more tones of a major or minor triad.

**alternating coursed.** Term applied to masonry in which two heights of stone alternate in regular manner.

**alto.** See alt.

**alto clarinet, flute.** See MUSICAL INSTRUMENTS.

**alto-rilievo** (It.). High relief; sculpture in high relief. See relief; relief sculpture.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

**aluminum.** In painting, sheets of aluminum have occasionally been used as panel supports, more in the practice of restoration than elsewhere. It is a relatively modern metal in any general use, large-scale production having come in only during the early years of the 20th cent. As a leaf or powder mixed with a suitable medium, aluminum has been applied to the backs and edges of panels as a protective coating. —G.L.S.

**amalaka** (Skt.). An ornament, bulbous or melon-like in shape, which tops the turrets (shikharas) of medieval Indian temples. See INDIAN ART.

**amalthea.** A horn of plenty, so-called from the name of the goat which suckled Zeus, from whose horn flowed whatever the possessor wished.

**Amarāvatī school.** See SOUTHEASTERN ASIATIC ART.

**Amazon River culture.** See AMERICAN ABORIGINAL ART.

**Amazons.** In Greek mythology, the female warriors of Asia Minor against whom the Greeks fought at various times under the leadership of the heroes Theseus and Achilles; represented in art in short girt chiton and helmet, armed with shield, spear, bow and axe, and usually mounted. —L.T.S.

**ambo.** Pulpit and reading desk of large size; found in early Christian and Eastern churches. See EARLY CHRISTIAN ARCHITECTURE.

**Ambrosian chant.** See MEDIEVAL MUSIC.

**ambry** (L.). (1) A depository for goods, food, or valuables. (2) In ecclesiastical architecture: A place or closet for depositing sacred vessels, etc. —J.M.M.

**ambulatory.** A sheltered passageway or aisle, as around the apse of a church.

**Amen, Amon, Amen-Ra.** Ancient Egyptian god originating in Thebes; had varied history as god of reproduction, of creation, etc.

**amenities.** See CIVIC PLANNING.

**Amenti.** In ancient Egyptian religion, the realm of the dead.

**AMERICAN ABORIGINAL ART, Central and South America.** The art of the American Indians was a highly diversified one made by many different tribes and many different traditions and with many different purposes in view. A summary cannot do justice to its complexity. The subject may be best discussed in terms of the divisions used in current western culture, namely, architecture, sculpture, painting, jewelry, pottery, and applied design. Prominence in any one of these fields is not necessarily correlated with general cultural advancement. The technical horizon of the American Indian was Neolithic. His art was comparable to that of Bronze and Iron Age developments in the Old World.

The study of American Indian architecture in its highest manifestations depends on archaeological research, which in turn rests on the amount of damage done by nature, time, and man. The houses of various tribes, made of skin, birchbark, wood, adobe, thatch, or stone, often attained forms and shapes which are interesting to our modern eyes. Their buildings were usually utilitarian, however. In the Southwestern United States communal buildings of several stories often suggest a long-range planning ability influenced perhaps by principles of balance and harmony of plan In Mexico in some of the ancient towns like Tenochtitlan the streets were so arranged that one emerged upon the central plaza where the important ceremonial buildings were located In Peru city planning existed from very early times and enormous towns made of adobe and stone were laid out in an orderly plan. Few of these great cities have been extensively excavated because of prohibitive costs.

The utmost was achieved in the ceremonial architecture of Middle America. A set principle was involved since the concept was developed of having an altar set on a platform to dramatize and focus the religious acts. In time the altars came to be larger and developed into temples. Usually the temple and the platform were designed as a unit, and as time went on the platforms were made larger and higher and the temples were ornamented with increasing luxuriance. As religion in Middle America came to dominate and absorb the surplus energy of the people more and more immense ceremonial centers were created. Sometimes the temples were laid out in terms of a plan, and at other times and in other localities the ceremonial buildings were erected without much heed for orderly spacing. Usually when a ceremonial center was created there were subsidiary dwellings for the priesthood, some of which in size and elegance rivalled the temples themselves. Materials used in building were stone, plaster, adobe, wood, and thatch. Mechanical and technical developments were

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

relatively rudimentary. Temples and houses were roofed with a pitched thatch or a roof of beams. Sometimes to get a high and soaring roof a beam cribwork served as an armature for plaster. The Maya of Yucatan and Guatemala made extensive use of the corbelled arch, encasing the tails of the stones in a monolithic structure of mortar. In Peru there are reports of an occasional tau keystone, used in vaulting a room or doorway.

Sculpture had a long historical development in the Americas, and it seems to have been religious rather than purely aesthetic. The earliest sculpture tradition may be observed in baked clay. Owing to its perishability we do not have much of this. At the beginning clay sculpture seems to have been representational, often used to make little female figures of clay, perhaps in illustrative association to a female goddess so often associated with agricultural peoples. Great emphasis was laid on anatomical details. As the cultural and technical development of the people increased and their theology was ramified, more sophistication came in. In Middle America where a polytheism held sway many gods and goddesses had to be defined ritualistically. Some divinities were thought to be more like human beings and here we find expression of a lively naturalism. Baked clay, even up to the time of the Conquest, apparently was considered a worthy medium for sculpture, and, just as in early China, no study is complete without strong emphasis on the work in clay.

Stone sculpture, to judge from the archaeological evidence, came in several centuries after the clay modelling had been in vogue. Since the sculptors had only stone tools to work with, contours rather than basic anatomical details tended to be emphasized. Free-standing monumental sculpture was to be found in the great images of the gods. Adorning the inner and outer walls of the temples relief sculpture was extensively used. The aim was representation, but always in the composition of American Indian sculpture was a strong sense of harmonious and balanced disposal of elements. There is considerable evidence among the Maya that they took their first steps in sculpture in clay, then shifted to carving the lime-plaster of their temples, and when lime-plaster gave way to dressed limestone they had already perfected the principles of their art.

Size does not seem to have had an effect in direct proportion to excellence of artistic presentation. There are small exquisitely carved jades that have all the sense of monumentality of presentation which can be found on the major figures of the temples. A very striking feature of American Indian sculpture in general is its perfect balance and harmony, no matter what its size.

Sculpture in wood is rarely found, but the surviving examples from Mexico give every indication that it closely paralleled work in stone.

There are several regions and tribes distinguished for their sculpture: the 19th cent. Indians of the Northwest coast for their work in wood; the burial mound builders of Southern Ohio for their naturalistic sculpture, made perhaps in the 11th to 12th centuries; the temple mound builders of the Southeastern United States for their work in pottery and in stone, made perhaps in the 14th to 16th centuries; the pre-Conquest Aztecs for lively naturalism in clay; the inhabitants of the Valley of Mexico from the 2d cent. B.C. to the Conquest for long-range evolution in sculpture in clay and stone; the tribes of the Vera Cruz region, and Olmec, for monumental and small size sculpture in porphyry, jade, and allied stones; Maya groups of central America for stone and plaster carving in the round as especially developed at Copan in the east, carving in relief on the west in the Usumacinta Valley; in Costa Rica a less developed carving in stone; in Peru stone work is important in the early periods but does not attain the great sophistication of Central America—in later times the plastic art is expressed more in clay; in Bolivia the important monumental sculpture in stone is inferior in technique.

Painting does not seem to have been the important vehicle for artistic expression that it has been in the western world. On the other hand, the materials and surfaces used by painters are very perishable. In general, painting was used to express ceremonial concepts or to tell some sort of a story. There was relatively little development of perspective and tones were flat. Frescoes showing considerable ability in design and of value as a record of human activity have been recovered at Teotihuacan, Mexico; others of ritualistic character have been found in several Aztec sites in the same country. A number of manuscripts dating from before and just after the Conquest reveal a lively pictorial sense. A few Maya frescoes have been recovered at Chichen Itza. These describe scenes of native life and warfare. The three Maya books surviving are ritualistic, so it is hard to judge of excellence in draftsmanship from them. However, in the bas-reliefs of the western Maya country one can see in the outlines of the figures evidence

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

of excellent draftsmanship. This is borne out by the vases from the Alta Verapaz area, which take top rank in examples of Indian craftsmanship.

Little has survived further south. In Përu, however, potters of the Early Chimu period decorated their vases with lively naturalistic scenes. In the later Nazca periods naturalistic elements drawn and painted with rich colors attest to skill of a high order.

Jewelry was a highly developed craft in ancient America. Stones such as jade, turquoise, amethyst, moonstone, obsidian, and other varieties were used to make necklaces, amulets, earrings and mosaics. There was also some use of metals including gold, copper, gold plating, and, rather sporadically, silver. Metals were cold hammered and also cast. Outstanding jade work comes from southeastern Mexico. Mosaic work is prominent in the same area, and, while well executed gold jewelry was created in southern Mexico, the great bulk comes from a belt along the Pacific range from Costa Rica to Peru. The Spaniards found that the native jewelry rivalled the products of contemporary Spain.

The pottery of the American Indians reached the level of a fine art. The forms in general tended to be squat and broad, following almost architectonic principles, since they were built up by strips of clay. Since the potters' wheel was unknown, the graceful elongations created by this process were not obtained. The variety in form is astonishing. Each tribe, each region, each era, is distinguished by characteristic methods of shaping and decorating vessels. Decoration was achieved by many methods including painting, modelling, incision, and polishing. Effigy forms were likewise made. Some of these naturalistic vessels come under the head of sculpture. Glazing was virtually unknown. A lead glaze paint was occasionally used along the Rio Grande River after the 13th cent. A.D., and in Central America there is a highly burnished ware that approaches a glaze.

In terms of shape, excellence of clay, painting, and variety of form of ceramics Peruvian peoples are preëminent. Less for ability than imagination in combining form and design, Middle American ceramics stand out.

One of the old, old arts of the Americas is weaving. While many of the textiles are lost, in Middle America we can reconstruct patterns and designs from the sculptures. On the coast of Peru, however, the absence of rain has preserved many burial mounds and there is a rich harvest for the student of weaving. Virtually every process known to the Old World was employed by the ancient Peruvians. Furthermore, most of the dyeing processes known today were known also to those masters of the weaving art. There is evidence that weaving was mastered considerably before other fields of design were developed, and a tendency to abstract handling of design visible throughout Indian art of the two Americas may well be due to the tremendous influence exerted by textile design.

Craftsmanship raised almost to the level of an art extended to the manufacture of almost every implement, since to manufacture any implement by hand calls into being the best of craftsmanship. Thus, a weight for a spindle may be a beautiful carved and burnished clay disk, a wooden throwing stick for propelling a javelin may be exquisitely carved in a ceremonial design. A dress for a priest or chieftain called into play the arts of the weaver, the jeweler, the sculptor in the preparation of a mask, and often the services of one of the great American crafts, that of feather work, used not only in clothing, but also in exquisite mosaics applied to shields and banners. Mirrors are sometimes a mosaic of iron pyrites. One or two examples exist of pyrites mirrors which have been ground to enlarge the image.

Whistles, flutes, and other instruments often bearing sculptured designs and made for use in temple services, also show excellent craftsmanship.

Art for art's sake apparently did not exist among the American Indians, nor are there words in their languages which have the same significance as our terms "art" and "aesthetics". There was a definite recognition, however, of superior things. The finest work in any new medium was almost always directed toward religious use. In that religious and civil life went hand in hand, the tribal leaders had access to the fruits of the craftsmanship directed to religion. In countries like Mexico, Guatemala, and Peru the outlet offered by the evangelists of the country after the Conquest continued in a different form the ancient tradition of craftsmanship. Today in outlying districts their handmade and homemade implements and utensils are still used and many of the old techniques persist. However, few of the ancient designs have been brought down. Usually there is a Spanish colonial background slightly altered by the ancient techniques. Given an outlet there is a latent force ready to spring into action today. See A. **American Empire style.** See Duncan Phyfe; FURNITURE; INTERIOR ARCHITECTURE AND DECORATION.

**American folk forms, in literature.** As a result of the acculturation process, folklore in America has developed certain distinctive forms and traits that are American in history if not in origin. Many of these are variations in time as well as in place. Such, for example, is **tall talk,** which flourished South by West in the period of national expansion after the War of 1812. As a form of "backwoods eloquence" or strong language constantly striving to outdo itself, tall talk suited the frontier mood of reckless energy, boundless optimism, and outrageous confidence. It is further related to the national habit of boasting and boosting and has its political counterpart in stump-speech and spread-eagle oratory.

In the plays, fiction, and sketches of the time (James K. Paulding's *Lion of the West* and *Westward Ho!,* Robert Montgomery Bird's *Nick of the Woods,* the Mike Fink legends and the Davy Crockett almanacs), backwoodsmen and rivermen of the "half-horse, half-alligator" or "ringtailed roarer" type were represented as speaking fantastic strings of gab compounded of coined epithets and expletives, exaggerated comparisons, and animal allusions. This literary dialect culminated in boasts and "bad man yells," whose lineage may be traced to the epic brags and flytings of the Middle Ages but whose accents are distinctly American:

> I'm that same David Crockett, fresh from the backwoods, half-horse half-alligator, a little touched with the snapping turtle; can wade the Mississippi, leap the Ohio, ride upon a streak of lightning, and slip without a scratch down a honey locust; can whip my weight in wild cats. . . .

As their language was tall talk, so the deeds of the "tall men" of the woods and the rivers were **tall tales.** Many tall tales originate in competitive bragging which degenerates into competitive lying. The parent type is the **yarn,** a long, extravagant, amusing tale of invention, which in its rambling structure and leisurely pace resembles the "humorous story" described by Mark Twain in "How to Tell a Story" as the distinctive development of story-telling in America and best illustrated by his own yarn, "The Celebrated Jumping Frog of Calaveras County." As the vehicle of Southwest humorists in the 1830's, the mock-oral yarn was a droll story of local customs and characters, which simulated the manner of spoken narrative.

When incredibility rather than drollness is the main element of the yarn, it becomes a **tall story** (*tall*: remarkable, prodigious). The term "tall tale" is generally reserved for the traditional tall story as distinguished from the ordinary tall story, which is an individual invention.

Tall stories are known variously as windies or big windies (from the manner of telling); fish stories (from a common tall-story theme); bunkhouse, bunkroom, barroom, or grocery store stories (from the place of telling); sailor's or traveler's yarns (from the person who tells them); and whoppers or big lies (from the chief ingredient).

Although the yarn or droll tale is sometimes referred to as a tall tale (as in Franklin J. Meine's *Tall Tales of the Southwest*), the tall tale takes three typical forms: (1) the pranking or hoaxing tale, told to "take in" the newcomer and entertain the old-timers; (2) the whopper or lying tale, told in the spirit of competitive lying as at Liars' Clubs and in Liars' Contests or from the Liars' Bench (an actual or figurative seat for story-tellers) or on the Deacon's Seat of logging camps; and (3) the cycle of tales growing up around the marvelous feats and mythical companions of a superman of the Paul Bunyan type.

The themes of tall tales are the perennial ones of boosters and knockers — freaks of weather, climate, soil; insect pests; marvelous hunts; feats of skill and strength; and "fearsome critters" (which are also attracted into the Paul Bunyan cycle).

Perhaps it is because our folk story-tellers are mainly jesters that we have no great body of **hero legends** outside of the Paul Bunyan type (variously assigned to Pecos Bill, Tony

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

Beaver, and Febold Feboldson, the last two of whom are manifestly literary inventions). Most of our historical heroes are of the "success story" or Horatio Alger variety and have been taken over by the popular literature of edification or entertainment. In contrast to our comic demigods, our "bad men" have given rise to ballads rather than tales; while in between is a body of picaresque and "adventure" folk literature concerned with scouts, trappers, hunters, explorers, and other frontier characters, one of the best of whom is Big-Foot Wallace.

Many Western heroes, like Jim Bridger and Jim Beckwourth, were windjammers in their own right. But the greatest of our folk heroes who was also our greatest practical storyteller is Lincoln. His vehicle was the **anecdote** or story with a point, in which Bret Harte saw the origin of the American short story and which is admirably suited to the practical purposes of politics, religion, and business, as indicated by the innumerable collections of anecdotes for speakers. The humorous anecdote or *joke* in America rings the changes on human folly and meanness. Favorite themes of gags and wisecracks (q.v.) are the absent-minded professor, the tight Scotchman the *enfant terrible* (Little Audrey), and the moron (the heir of the "so-dumb" lines).

The cruelty of these verbal jests reflects the sadism of **practical jokes**, the practicalness of which consists in the fact that something is done rather than said. These range from April Fool jokes and riddling tricks and catches ending in a "sell" to cheating tricks of swapping and trading (as in the many stories of horse-trading) through all the hoaxes perpetrated on strangers, such as sending a new hand in search of an impossible object, snipe hunts, badger fights, and the "whizzers" of the gold diggings.

Akin to the practical story-teller in his combination of horse sense and humor, with the addition of eccentric orthography and grammar, is the **crackerbox philosopher**, who has given us a long line of homespun humorists from Seba Smith's character, Jack Downing, to Will Rogers. Next to the newspaper letter, the favorite medium of the cracker box philosopher is the **humorous travelog**, a form which has been employed by literary comedians and vaudevillians of the "Slow Train through Arkansaw" type to point up local and regional differences. In countless place names and nicknames, phrases, sayings, allusions, rhymes, songs, and other **floating material** or "stuff that travels" American folklore reflects the restlessness and diversity of the American scene. See *American Humor*, by Constance Rourke, 1931; *Ring-Tailed Roarers*, by V. L. O. Chittick, 1941; *David Crockett, American Comic Legend*, by Richard M. Dorson, 1939; *Mike Fink, King of Mississippi Keelboatmen*, by Walter Blair and Franklin J. Meine, 1933; *Tall Tales of the Southwest*, by Franklin J. Meine, 1930; *Tall Tales from Texas*, by Mody C. A. Botkin, 1944.

—B.A.B.

**American folk forms, in music.** Recent trends in the study of folk music in America have broadened its scope beyond the narrower limits of vocal music, especially balladry, to include the whole range of traditional musical idiom and taste. This is conceived in terms of social functions and group activities, such as work, play, the dance, and religion.

Thus in the field of the **country dance**, the distinctive American development from British sources has been the **square dance, quadrille**, or **cotillion**, in contrast to the English *contra-dance* or *longways dance*, which still persists in New England. In the U.S.A. the term *square dance* has come to stand for old-time set dancing generally, whether of the square, longways, or circle formation. In the Southern Appalachians there has survived an older English form of country dance, which, like many of the ballads, has been more or less forgotten in the mother country. This was dubbed by Cecil J. Sharp the **running set**, from the characteristic running step of the dancers—a fast glide, free and easy in its execution, with certain flourishes such as the clog, shuffle, two-step, hoe down, and buck dance. Its figures are square dance figures, in circle formation, without fixed order or the courtesy movements that the English country dance acquired under French influence.

The two most important persons at a country dance are the *fiddler* and the *caller*. Although the guitar and the banjo are used to accompany the fiddle at dances, as well as to accompany the folk singer, the fiddle is the American folk musical instrument par excellence. Its portability and adaptability made it the musical voice of backwoods and frontier

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

America and the country fiddler one of the most picturesque of pioneer folk characters. Another minstrel type is the square-dance caller or prompter, who, in a mixture of rhythmic prose and doggerel made up of "calls" interspersed with patter, intones and (in the Northeast and Southwest) sings or half-sings the directions.

Because of religious prejudice against dancing and especially the fiddle, as the instrument of the devil, the young people of rural America developed an alternative form known as the *play-party game* (q.v.), which substituted singing for instrumental accompaniment. A cross between dancing and the traditional singing games of children, the play-party retains the best features of both. To the courtship and other dramatic devices of the game, such as choosing and stealing partners, the play-party adds certain square dance movements and figures, in which, however, partners are swung by the hands instead of by the waist. The leader combines the functions of caller and floor-manager; and like the caller he is something of a folk-poet, with the gift of improvisation.

On the sacred side the old-time *country singing* keeps alive the church and singing-school tradition of unaccompanied three- and four-part singing. Throughout the rural South organizations like the United Sacred Harp Musical Association and their many state affiliates hold "little singings" of the "all-day-singing-and-dinner-on-the-grounds" type and annual "big singing" conventions during "laying-by" time. From the four or seven shape-note systems employed in their tune-books the singers are known as "fasola" or "dorayme" singers. The use of shape-notes, based on the older solmization, goes back to about 1800 when it was introduced by William Little and William Smith or by Andrew Law to make sight-reading easier by associating each note with a certain shape. The custom of solmization is a distinctive feature of shape-note singing, since, after the leader has given the page and the key, the group sings the song through once by notes, followed by one or more stanzas (often "lined out").

The songs are known as **white spirituals**, a mixture of "folk" and "art" hymns, anthems, and fuguing songs (the last traceable largely to William Billings' influence), with a variety of sources, including Isaac Watts hymns, ballad and dance tunes, and camp-meeting songs. White spiritual tune-book compiler-publishers, singing-teachers, and leaders have kept up a steady flow of composition and promotion, amounting to our major "folk song" industry.

What distinguishes these country singings from the related gospel hymn singing of revivals, protracted meetings, baptizings, foot-washings, and the like is the fact that here, without loss of religious faith, singing becomes its own reward.

Sacred harp singing has also penetrated to the Negro churches; and the question of the mutual indebtedness of white and Negro spirituals (q.v.) has stirred considerable controversy. By way of the Holiness Church, with its motto, "Enjoy your religion," musical instruments of the jazz-band type have been brought into the church, along with jazz singing and the "holy dance" (a variant of which is the ring-shout). "Folk quartets" in Negro churches also show the hybridizing influence of radio and commercial phonograph record techniques.

In contrast to square dancing and country singing, which have survived the competition of canned music, **work songs** tend to disappear with the displacement of hand by machine labor, symbolized in the greatest of American Negro occupational ballads and work songs, *John Henry*. The last refuge of Negro work songs of the choral type, accompanying group hand labor on roads, railroads, and levees and in the woods and fields, is the Southern prison, where forced labor creates a counterpart of the older plantation or slave songs. Even closer to the latter are the **field calls** and **hollers** or individual work songs of the "blues" type. In this connection it is worth noting that, outside of sea shanties and cowboy songs, our white "work songs," including lumberjack, canaller, and miners' songs, are occupational and labor songs rather than songs to accompany work.

Folk music is no longer a pure but a very hybrid activity, in which "folk," "art," and commercial influences mingle in a dynamic process of survival and revival. Increased popular interest in folk music, from true country music to the "hillbilly" variety, has been stimulated by **folk festivals** and contests (e.g., fiddlers' and dance contests at Galax, Va., and Asheville, N. C.; folk song festivals at White Top, Va., and Ashland, Ky.; and the National Folk Festival) as well as by organizations such as the American Square Dance Group. See *Research in Primitive and Folk Music in the United States,* by George Herzog, 1936; *The Country Dance Book,* V, by Cecil J. Sharp, 1918; *American Country Dances,* by Elizabeth Burchenal, 1918; *Traditional Music of America,* by Ira W. Ford,

**American glass.** See GLASS AND GLASS-MAKING.

**AMERICAN NEGRO ART.** *Colonial industry.* The beginnings of Negro art in America are found among the colonial crafts and industries of the 18th cent. Negroes brought from Africa and the West Indies to assist with the arduous tasks of farming and homesteading and to supply labor to a growing export trade soon became equally indispensable to various domestic industries such as spinning and weaving, iron manufacture, carriage-making, carpentry, woodblock-printing, gold and silversmithing and metalcasting. Induction into these skilled trades proceeded through the medium of the apprenticeship system; and while this was not an aspect of free labor, it did help to establish the Negro in a productive capacity in Colonial America by supplying many Negro members to the professional class of master artisans.

*Servile production.* Probably the outstanding instance of servile production in the field of the decorative arts is to be found in the city of New Orleans, where, legend as well as archaeological testimony has it, the greater part of the wrought iron in *Le Vieux Carré* originated in foundries completely manned by Negro slaves. This ornamental iron is undoubtedly the production of Negro blacksmiths of two different groups: There were those who emigrated to Louisiana territory from Santo Domingo and those who were born of slaves brought directly into the American colonies by the slave traffic.

The extant domestic architecture in North Carolina, Virginia and New York State also preserves identifiable traces of servile craftsmanship of distinguished quality. In North Carolina, the important vestiges of such skilfull functioning by Negro slaves can be observed in much of the brickwork that appears in several buildings of Dutch and Georgian colonial styles. For certain outstanding examples, however, of excellent construction and interior work see The Chapel of the Cross, Chapel Hill, Orange County (1835), and the Jansen House, Walkill Valley, New York State (1724).

In addition to the foregoing, the extant servile products of the early Negro craftsman and artist comprise fourteen portraits, thirteen of them in oil and one in pastel, one steel engraving and several blockprints of very good quality. There are also carved interior cabinet work *in situ*, and numerous items of iron work in the form of household utensils, hinges and locks which have been ascribed to the independent workmanship of the Negro slave.

*Free craftsmen and artists.* "Occasional" artists and craftsmen were those free or manumitted Negroes of the first half of the 19th cent. who were able to pursue their art only upon occasion of rare leisure or special assignment. Into this general classification fall such individuals as had actual workshop or studio training in one or more of the crafts or representational skills of the day. A certain number of Negro artists fulfill the terms of this grouping.

Patrick Reason (1813-18 ?) of New York City left a considerable body of steel-engravings and lithographs which were of an "occasional" or "commissioned" nature. Like the work of Robert Douglass (1805-1885) and J. W. Chaplin, Negro artists of Philadelphia, it grew out of race needs as well as the propagandistic efforts of the Anti-Slavery societies; but irregularity of employment together with the dispersal of the artists' energies in other channels of abolitionist work made actual production a sporadic affair. It is easily understood why the primary objectives of this early work became illustration and exposition rather than the capture of aesthetic appeal.

The best examples of Reason's work are his portraits of Granville Sharpe, DeWitt Clinton, James Williams and Henry Bibb. Reason is said to have copperplate-engraved a number of illustrations for Bayard Taylor's *History of America*.

Over against the work of these men was that of David B. Bowser and Vidal of Philadelphia, Robert S. Duncanson (1821-1876) of Cincinnati, and Primus of Boston. These painters, whose subjects and whose methods of work were more personal and far less concerned with popular movements, represent the persistent strain of individualism in American

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

Negro art at its earliest bloom. Paintings by Bowser ran to landscapes and a few figure pieces; the work of Duncanson consisted largely of panoramic landscapes of great size done in a semi-classical style, and reminiscent of Claude Lorrain. His paintings are owned by several public galleries in the State of Ohio and by Glasgow art gallery in Scotland. Primus was interested mainly in the illustration of biblical lore. Of this free-lance group, Duncanson was the only thoroughly trained artist. The rest were in the main self-taught painters whose works strike us today as rather naive.

*The Portraiture of Abolition and Emancipation.* For a decade preceding and following the Civil War the American Negro artist found his subjects almost exclusively among the leading personages and the concrete objectives of abolition and emancipation. Excepting Robert Duncanson and Primus, who were interested respectively in heroic landscape and devotional painting, the outstanding Negro artists of the 1850's and later were committed to a rather prosaic if honest kind of portraiture. While the social and political emphases were different, the tradition was largely the same as that stemming from the work of Joshua Johnston, the Negro slave of Baltimore, Maryland, whose talent won him the privilege of devoting his entire time to portrait painting as early as 1800.

In the 1860's, Edmonia Lewis (1845-1890), first Negro woman sculptor, modelled the features of Henry Wadsworth Longfellow, James McCune Smith, Robert Gould Shaw and William Lloyd Garrison. William Simpson (ca. 1820-1878) painted portraits of Jeremiah Loguen and his wife Caroline Loguen; while A. B. Wilson of Philadelphia made the likenesses of various leaders of the militant Negro Church, using the mediums of oil and lithography. All this shows a curious parallelism with the trend in abolitionist literature to eulogize anti-slavery character and to stress the heroic act as the mark of a convinced radical.

The climactic art achievement of mid-century was Edmonia Lewis' plastic group entitled "Forever Free" which she intended as proclaiming in advance the effect of emancipation to the New World. Although neo-classical in style and naturalistic in conception this and other later works by the same hand compare favorably with the statuary of Harriet Hosmer, Hiram Powers and other American sculptors of neo-classical persuasion. Credit for advancing the interest of American artists in direct emotional reactions to the things of nature is accorded by Henry Tuckerman, famous American art critic of the last century to Edmonia Lewis and to Edward M. Bannister (1828-1901), a Negro landscape painter of Providence, Rhode Island. Owing largely to Bannister's efforts the Providence Art Club was formed, which in turn became the nucleus of the present Rhode Island School of Design located at Providence.

*The Professional Tradition and the American School.* Turning away from the more general and popular traditions of hero-painting and romantic landscape, the Negro artist about 1876 began to re-examine both the technics and the content of art upon the impetus of racial drives toward better economic status. The period of Reconstruction had brought stimulating experiences to the race as a whole; but the artist was at first completely overwhelmed by the rapid movement of events. Increased educational opportunity and the growing political consciousness of the Negro minority helped to dispel, in the course of time, the artist's sense of confusion. Negro art then gravitated towards the union of professional artistic tradition with the new experiences on the one hand and the direct experiential contact with the world of events on the other. The first reaction represented the crystallization of the Negro artist's sense of his profession as a calling and a responsible field of endeavor; the second was that of the new generation of Negro artists to the immediate variety and flavor of the life around them.

The results of this new orientation can be seen in the expanded repertory of subjects in Negro art between 1870 and 1915. In line with the professional tradition of the new period was the work of Henry O. Tanner (1859-1937) who chose the religious and historical *milieu* of the Palestinian East for his specialty, and in the supple painting of William H. Harper (1875-1910), a gifted painter of landscape who worked not only in the middle Western States but also in France and Mexico. In sculpture, the professional tradition found its chief exponent in Meta Vaux Warrick (1876-) who used the human figure to give tortured but eloquent expression to her belief that humanity suffers from spiritual frailty and immemorial greed.

The native Negro "American School" should be compared in its objects if not in its results with the Philadelphia group of white American painters; that is, with George Luks, William Glackens, Robert Henri, Everett Shinn

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

and others who, at the beginning of this century, sought to document objectively their immediate surroundings, and for their pains were roundly scored by reactionaries and derisively termed the **Ashcan School** of American Art. Henry O. Tanner at first identified himself with similar interests, as witness "the Banjo Lesson" now at Hampton Institute, Hampton, Va. Vanquished, however, by American racial prejudice and the veniality of late 19th cent. American taste, he along with other American supporters of the professional tradition (Duveneck, Chase, Sargent, Whistler, *et al.*) took refuge in the broader sympathies and warmer taste of European art patronage.

The great fame and artistic success which Tanner finally achieved were denied the lesser talents whom he left behind to adapt their art to the untamed aspects of the American scene. Clinton DeVillis, W. O. Thompson, Samuel Collins (1880-1932), May Howard Jackson (1877-1931) and Richard Lonsdale Brown (1886-1915) provided some effectual lessons of creative contact with local American *genre* and practical idealism. DeVillis recorded brilliantly some scenes of boating and horseracing. Thompson evoked the native strain of mysticism in the Negro in several deftly brushed cosmic landscapes. A certain poetic naïveté developed in Brown's landscapes of Virginia hills. May Howard Jackson showed an aggressive spirit in her various well-modelled portrait-busts of Negro educators, and writers.

*The New Negro Movement.* From crucial post-War economic conditions directly affecting the physical mobility and labor status of the Negro masses developed the so-called **New Negro Movement** (sometimes referred to as the **Negro Renaissance**). More specifically, it arose in response to a widely felt need to interpret, to illustrate and to control the social and cultural by-products of the changed status of the Negro following World War I.

The most important cultural developments of the movement were localized in New York City; but there were significant correlative expressions in the District of Columbia, in Chicago, Boston and Indianapolis. The chief characteristics of Negro art within the movement of the 1920's were two: Subjectivity of expression and eclecticism of form. Subjectivity of expression governed the racial and social attitudes of the artist, aiding him in the selection of the materials of experience. But the eclectic training and cultural background of the Negro artist caused him to make use of various traditional forms in seeking to communicate his experience in fluent terms.

Evidence of the first characteristic is present in the work of nearly all the participating artists, but especially in the work of William E. Scott, Archibald Motley, Aaron Douglas, Malvin Gray Johnson (1898-1935), Hale Woodruff, James L. Wells, Sargent Johnson, and Elizabeth Prophet. With each artist the subjective element received a different adumbration. Of special interest as reflecting the folk pattern of the New Negro Movement are the paintings of Aaron Douglas and Hale Woodruff. For the documentation of Negro types and character one should consult the portraits of Laura Wheeler Waring, E. A. Harleston (1889-1934), and Malvin Gray Johnson.

*Modernistic and Populist Developments.* Towards the end of the third decade of this century another aspect of creative vision began to find prominent place in Negro art. For a while, a self-conscious modernism attributable to the influence of certain modern French painters of this century took actual vogue. This trend involved a short-lived academicism through imitation of African Negro sculpture as well as a serious application of Frenchified intellectualism to plastic and pictorial problems. **Negro Cubism** as exemplified in the experimental painting of Hale Woodruff and **Africanism** as shown in Malvin Gray Johnson's middle-period art, J. L. Wells woodcuts and Sargent Johnson's sculpture were direct outcomes. For a while, it was believed that this modernistic trend would completely alter the course of Negro art.

The reaction to this drift came indirectly to painting through scientific and literary channels. Anthropological, sociological and psychological and fictional studies of the southern Negro aroused an interest in the Negro folk as a repository of certain supposed original instincts and primordial virtues of the Negro peasant. There followed what may aptly be termed an interval of populist painting tinged with radical social meaning. The latter movement emphasized the work of Archibald Motley of Chicago, Richmond Barthé and Malvin Gray Johnson of New York City, Hale Woodruff of Atlanta, Georgia, Leslie G. Bolling, woodcarver, of Richmond, Va.

*Federal Patronage of the Negro Artist.* In contradistinction to the aims of the subsidized white artist the aims of the black artist sponsored by Federal Art Projects never wavered

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

from self-expressional interests. Without altogether ignoring the growth of Regionalism in American art the Negro continued to portray his reaction to the segregated existence of his minority, taking care to stress the crude emotional values thereof above the painful down-to-earth facts. In mural painting this attitude had a retarding effect upon skilfull, deliberate and clear execution, except in the case of Aaron Douglas who rapidly developed a formula for decorative mural painting.

Since 1934, Negro art has gained enormously in technical facility and expediency and in that fluent presentation of ideas which implies both inspiration and reflection. There has been wide experimentation in new or revived mediums. For instance, in Philadelphia Dox Thrash under the sponsorship of the W. P. A., has discovered the application of carborundum to artistic print-making. At the same time, there has been developed a closer articulation of process with significant expression throughout the production of the second generation of Negro talents; so that a genuine and typical American thoroughness combined with a pioneering spirit marks the production of such painters as Charles White, Samuel Brown, Eldzier Cortor, Charles Alston, and Jacob Lawrence and of sculptors like Henry Bannern, William Crump, Alice Catlett, William Artis and Sargent Johnson. See B. Brawley, *The Negro Genius,* 1936; C. T. MacChesney, A Poet Painter of Palestine, *Intern'l Studio* (July, 1913); J. A. Porter, Versatile Interests of the Early Artists, *Art in America* (Jan. 1936); Locke, *The Negro in Art,* 1940; J. A. Porter, Four Problems in the History of Negro Art, *Journal of Negro History* (Jan. 1942). —J.A.P.

**AMERICAN NEGRO LITERATURE** is a segment of American literature. Although its subject-matter is predominantly concerned with the Negro's struggle for equality, it does not constitute a unique cultural pattern. It must not be thought of merely as "Negro literature," a tradition apart from the main stream of American literary development. The Negro writer is American; his work is American literature.

*18th Cent. Beginnings.* The first known publication by an American Negro was *An Evening Thought: Salvation by Christ with Penitential Cries.* Appearing in 1760, it was written by Jupiter Hammon (c. 1720-c. 1800), a slave of Queen's Village, Long Island. Obviously influenced by Methodist hymnody, the poem has historical significance only. It does show, however, the early influence of the evangelical churches on the slave mind, an influence reflected with greatest art in the spirituals.

The second 18th cent. poet, Phillis Wheatley (c. 1753-84), like Hammon was influenced by the religious forces of the Great Awakening, but unlike him was a writer of unusual talent. Born in Africa and captured by slavers when she was about seven, Phillis Wheatley acquired in an incredibly short time both the literary and the religious culture of her Boston masters. Her first publication, *A Poem by Phillis, a Negro Girl in Boston, on the Death of the Revcrend George Whitefield,* appeared in 1770. *Poems on Various Subjects, Religious and Moral,* her only volume of collected verse, was published in London in 1773. Her best known poem is probably that dedicated to George Washington on his appointment as Commander-in-chief of the Colonial Army. Writing in the strictest of Neo-classic styles, Phillis Wheatley has little or no self-revelation in her poetry. A typical New Englander of the late 18th cent., she recorded as deftly as any of her contemporaries the moral and pious thoughts of the Boston Puritans of her day.

The first known prose publication by an American Negro was *A Narrative of the Uncommon Sufferings and Surprising Deliverances of Briton Hammon, a Negro* (1760). The two Hammons—Briton and Jupiter—are not related. Having no conspicuous literary merit, the *Narrative* is of significance only as the first of a long line of autobiographical works by American Negroes.

The **folk contribution** of the American Negro has been far better known and far more influential than his conscious art. The Negro's most important cultural gift to America has been the **spiritual,** the religious folk song of the slave. In recent years there has been much controversy concerning, first, the interpretation of these songs, and, second, their origin—i.e., whether their musical background is predominantly African or European. Whatever the origin, practically all scholars now agree that the spiritual itself is the Negro's own and is stamped with his originality.

Along with the spirituals go the **slave seculars**—dance songs, children's play songs, and humorous songs. In some the Negro sang ironically of his master and irreverently of his own religion. Whether **cornfield hollers** or **jig-tunes,** these songs dealt realistically with the humorous or seamier side of life. They are a foil, as it were, to the noble mood of the spiritual. Ignored by the first New England

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

collectors because of their frivolity and realism, they were nevertheless early appropriated by black-face minstrelsy and patternized. Thomas W. Talley's *Negro Folk Rhymes* (1922) was the first collection of these songs.

Collectors have found in Negro folk material variants of several well-known English and Scottish ballads. Considering the social and cultural isolation of the Southern Negro, this is perfectly understandable. But the Negro not only preserved and altered European ballads; he has made many vigorous ones of his own, narrating the exploits of his own heroes and bad men like "Stakalee", "Uncle Bud", "Railroad Bill", "Po' Lazarus", "John Henry", and others. The best known folk hero among Negroes is John Henry. Like Paul Bunyan but far more colorful, John Henry by his strength, courage, and endurance symbolizes the Negro workman's way of life. The Negro ballad generally tells a story with economy, without sentimentality, and with the tragic sense of life so often characteristic of the best ballad literature.

Among Negro folk songs **the blues** are second in importance only to the spiritual. The latter is intended for group singing, the blues to express the feelings (usually sorrowful) of an individual singer. These feelings are expressed, however, in an idiom so familiar to the singer's audience that they, too, can share his feeling. "Blues" has become a part of the American vocabulary. As songs they are internationally known.

The folk contribution of the Negro includes also **work songs**, songs of protest, aphorisms, folk tales and folk sermons. The most widely known examples of **folk tales** have been those told by Joel Chandler Harris' Uncle Remus. The first substantial collection of these tales by a Negro is *Mules and Men* (1935) by Zora Neale Hurston. There are many collections of work songs, but the first collection of Negro songs of protest was made by Lawrence Gellert in 1936. The folk sermon has been often burlesqued; Roark Bradford's *Ol' Man Adam and His Chillun* from which *Green Pastures* was derived is a good example. But James Weldon Johnson in *God's Trombones* (1927) has captured the essential dignity, eloquence, and poetry of these sermons.

*Anti-Slavery Writings* (1800-65). By the early years of the 19th cent. the larger Northern cities had acquired sizable colonies of free Negroes. Feeling the pressure of a steadily rising prejudice, they were forced to form their own social and religious organizations. In 1816 Richard Allen founded the African Methodist Episcopal church and became its first bishop. Individual churches of other denominations sprang up in the various cities. The first Negro periodical, *Freedom's Journal*, was founded by Samuel E. Cornish and John B. Russwurm in 1827, and before 1855 over one hundred journalistic ventures—successful and unsuccessful—had been started by Negroes. The churches, literary clubs, social organizations, and the journals of Northern Negroes became increasingly articulate on the subject of slavery and the chorus of protest swelled.

The outstanding and most sensational attack upon slavery prior to 1840 was the *Appeal*, a pamphlet written after the model of the Constitution by David Walker (1785-1830), a Boston Negro who had been born free in Wilmington, N. C. The *Appeal* was so incendiary in nature that it caused consternation among the Southern slavocracy. Many planters tried to attribute Nat Turner's Rebellion (1831) to the inflammatory influence of Walker's work.

Walker was the first and outstanding member of a group of protest writers of the period. Among his best known and most powerful successors and followers were David Ruggles, Henry Highland Garnet, Martin R. Delany, Samuel Ringgold Ward, James McCune Smith, and William C. Nell (who was associated with Garrison on the *Liberator*). These men in pamphlet, speech, and periodical waged a relentless propaganda war against the institution of slavery, and they worked hand in hand with Garrison and other white abolitionists.

William C. Nell was also the first Negro to make a serious attempt at writing the history of his own people. At the suggestion of Whittier, Nell published in 1851 *Services of Colored Americans in the Wars of 1776 and 1812*. In 1855 he brought out a larger work, *The Colored Patriots of the American Revolution*. James McCune Smith, William Wells Brown, William T. Catto, William Douglas, and J. W. C. Pennington were among the others who attempted to write the history—secular or church—of the Negro. They all, of course, considered history good abolition propaganda. But it was not until after the Civil War that creditable work in the field was accomplished by the Negro author.

The poetry of this period echoed the anti-slavery sentiments of the prose writers; it also echoed the strains of classic English and American writers. Though too highly imitative, too highly oratorical, and too monotonous

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

in theme, this anti-slavery poetry showed at least that the Negro writer was mastering the medium in which he worked. Daniel Payne (1811-93), James M. Whitefield (1830-70), Charles L. Reason (1818-c.1898), George B. Vashon (? - 1878), James Madison Bell (1826-1902), and Frances E. W. Harper (1825-1911) were the outstanding poets of the period. With scorn and denunciation of all halfway measures, these writers demanded of America full democracy. For them poetry was primarily another vehicle for anti-slavery propaganda.

One poet of this age, George Moses Horton (1797-c.1883), deserves special mention. He was a slave (the others were free Northerners), and he was the first of the group in point of time. Born in North Carolina, Horton though a slave was allowed to hire himself out to the University president at Chapel Hill. There he learned to read and write and became a campus 'character", writing love lyrics for the students. His first volume, *The Hope of Liberty,* appeared in 1829, the second, *Naked Genius,* in 1865. Unlike his predecessors and contemporaries, Horton had a generous vein of humor in his make-up and could in his later work laugh at "Jefferson in a Tight Place." Even though his protest was conventional, he was the first Negro poet to write against slavery.

Another type of writing from this period is unique and little known to historians of American literature. It is the **slave narrative** —the story of an escaped slave, either written by himself or dictated to some agent of the various abolition groups and used by them for propaganda purposes. This new type of literature sprang into popularity during the thirties. Among the best known slave narratives were those by Henry Bibb, Samuel R. Ward, William Wells Brown, Frederick Douglass, and Josiah Henson. The last named person met Mrs. Harriet Beecher Stowe and is supposed to be the prototype of Uncle Tom.

William Wells Brown (c.1815-1884) and Frederick Douglass (c.1817-95) were the two outstanding writers of the period. Born a slave in Lexington, Ky., Brown escaped to freedom by way of a Mississippi river steamboat to Cincinnati. There he was helped through the Underground by a Quaker named Wells Brown whose name he took. As a boy of twelve, Brown was office-boy for Elijah P. Lovejoy. In 1847 he became an agent of the Mass. Anti-Slavery Society. A pioneer in several fields, Brown was the first American Negro to publish a book of travel, *Three Years in Europe* (1852) ; the first to publish a drama, *The Escape, or A Leap to Freedom* (1858), and the first to publish a novel, *Clotel, or the President's Daughter* (London, 1853). He was also an early historian, short story writer, essayist, and the first biographer of note. Though often crude and inept, Brown deserves great credit when his background is considered.

Douglass, one of the great men of the Abolition Movement and one of the great orators of American history, was born a slave in Maryland. The story of his life is an American odyssey of success over almost insuperable odds. Twenty-four years a slave and three years a day laborer in Massachusetts, he rose to become the greatest Negro leader of the era. His literary fame rests upon his editorship of *The North Star, Frederick Douglass' Paper,* and *Douglass' Monthly;* his speeches; and his autobiography, *The Life and Times of Frederick Douglass* (1881, enlarged, 1882). The last named work is the best work of its type yet written by an American Negro.

*Reconstruction and Transition* (1865-1925). During the Reconstruction Period, there arose a strong school of Southern white "local color" (q.v.) sectional apologists who seized upon the "Negro question" and the Negro character as a means of propagandizing America concerning the Old South and its glories. Their works were peopled with indelible stereotypes of the plantation Negro—docile, contented, and comic. Their delineation and approach gave the Negro writer a nice problem: to deny the stereotype by setting up an opposite as the "true" Negro or to use the stereotype but deepen the characterization by sympathetic realism. Both ways were pursued by the Negro writer.

Albery A. Whitman (1851-1902) took the first means. In *Not a Man and Yet a Man,* the longest poem written by a Negro, he portrays the highly idealized slave. *The Rape of Florida* treats in a similar manner the Seminoles and their Negro friends and kinsmen. Whitman's militancy is pronounced in these and other poems.

A poet of much greater ability, Paul Laurence Dunbar (1872-1906) took the second way, displacing comic posters with sympathetic photography. A humorous observer and not a reformer, Dunbar wrote in the genre of Russell and Page about the Old South and after the pastoral manner of Riley and Will Carleton about his own times. Praised by William Dean Howells, as the first American Negro poet to "feel the Negro life aesthetically

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

and to express it lyrically", Dunbar in his best dialect verse has written with a great deal of talent. His picture of rural life though idyllic is peopled not with caricatures but with likeable human beings. The most popular Negro author of his day, Dunbar was also short story writer and novelist. His work in these fields, however, was inferior to that in poetry.

Naturally, there were other Negro poets in both camps, but the dialect school had the larger following. On the other hand, there was also a third way of reacting to the conditions of the age—the way of escape. Choosing to ignore the race problem several Negro poets sought refuge in the ivory tower of "literary" poetry. Outstanding among these was William Stanley Braithwaite, whose finished and mystical verses fail to touch the question of race. A noted critic, Braithwaite is now better known as the editor of the *Anthology of Magazine Verse* (issued annually from 1913 to 1929) than as a poet.

The prose writers of the era also adopted two opposing attitudes. With the increase in mob-violence and the almost total disfranchisement of the Southern Negro by 1902, there arose among the colored leaders two schools of thought with reference to the "way out". The first was the way of appeasement, and its most highly gifted exponent was Booker T. Washington (1858-1915). Seasoning bitterness with good humor, Washington in his numerous speeches and works advocated patience, compromise, and interracial cooperation. His most popular work, *Up from Slavery* (1900), shows this conciliatory approach. It is a classic American autobiography and, with the probable exception of *Native Son,* the best known work by an American Negro.

Opposition to Washington's attitude was naturally most articulate among Northern Negroes. Chief among the militant writers of the period were William Monroe Trotter, Boston journalist; Kelly Miller, Dean of Howard University; and Dr. W. E. B. DuBois, able and uncompromising editor of the *Crisis.* With varying degrees of militancy, these men demanded justice from America.

Though DuBois' career carries over into the next period, much of his finest work was done before 1925. *Souls of Black Folk* (1902), *The Quest of the Silver Fleece* (1911), *Dark Water* (1921), *The Gift of Black Folk* (1924), and some of his best historical and sociological studies were all written during this period. In scholarship, in style, and in sheer power DuBois has few peers. As a writer of protest he is unequalled.

After the Civil War several writers chose history as a means of justifying and vindicating the Negro's new position in American life. In 1883 George Washington Williams wrote *The History of the Negro Race in America from 1619-1880* to show that the Colored American has always "displayed matchless courage and incomparable heroism". In 1888 he published *A History of the Negro Troops in the War of Rebellion.* The same year saw Joseph T. Wilson's *Black Phalanx.* But the first scientific history written by a Negro was DuBois' *The Suppression of the African Slave Trade to the United States of America, 1638-1870* (1898), also the first monograph of the Harvard Historical Series.

Biography was also called upon to prove the black man's worth. Using as models the works of Henri Gregoire and Lydia Maria Child, William Wells Brown published the *Rising Son* (1874), a series of sketches of famous Negroes. Brown's work had originally appeared in 1863. William Still published in 1872 the *Underground Railroad Records,* a fascinating and unusual work, giving first-hand portraits of escaped Negroes. The first scholarly biographer, however, was Archibald H. Grimké, whose works, *William Lloyd Garrison, the Abolitionist* (1891) and *The Life of Charles Sumner, the Scholar in Politics* (1892), are distinguished studies. Charles W. Chesnutt's *Frederick Douglass* (1899) is also an able work.

The works of Charles W. Chesnutt (1858-1932) belong in the main to the protest school of American Negro writing. The best fiction writer of the period, Chesnutt in one volume of short stories, *The Wife of His Youth* (1899), and in three novels, *The House Behind the Cedars* (1900), *The Marrow of Tradition* (1901), and *The Colonel's Dream* (1905), has given us bitter but unforgettable pictures of conflicts along the "Color Line". In *The Conjure Woman* (1899), he made use of Negro folk material, creating in his character, Uncle Julius, a much more realistic raconteur than Uncle Remus. A sincere work of art, *The Conjure Woman* compares favorably with similar though better-known works by Harris and Page. Chesnutt, Dunbar, and Grimké were the three Negroes who in the nineties gained recognition as men of letters irrespective of race.

James Weldon Johnson (1871-1938) is a transitional figure. Teacher, lawyer, actor, musical comedy writer, diplomatist, organizer,

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

novelist, and poet, Johnson in his varied and colorful career probably influenced the literature of the American Negro more than any other man of his generation. *The Book of American Negro Poetry* (1922) was a pioneer effort in anthologies, and it served both as an interpreter of Negro artistic achievement and as a stimulus to young writers. *The Autobiography of an Ex-Coloured Man* (1912), a novel of passing, anticipated several later works. Johnson has a place among the major Negro poets; his autobiography, *Along This Way* (1933), is an important American book. At his death, Johnson was the most successful interpreter of the Negro creative artist to America at large.

*The New Negro to the Present (1925-42).* During World War I and in the days immediately following, many social forces conspired to alter the general contour of Negro life in America. Chief among these were the extensive migrations of Southern Negroes to large Northern cities. As a result there arose among Negroes a new consciousness of the power and rights of labor and a growing awareness of the importance of organization, generally on the basis of race, though a few advanced thinkers saw the Negro problem as essentially proletarian. There arose among them greater self-respect, fostered both by Garveyite oratory and sober scholarship, and increased militancy. In the nation at large, post-war liberalism sponsored more than ever before the Negro's cause.

The Negro writer reflected these changes. Harlem became the most articulate center of this expression. Under the sponsorship of DuBois of the *Crisis* and Charles S. Johnson of *Opportunity,* the leaven of this new spiritual and literary awareness became more productive. Alain Locke supplied the name to the movement—**New Negro**—and his work, *The New Negro* (1925), not only interpreted the spirit of this minor renaissance but is now its landmark.

The forces that produced the New Negro poets were at work, of course, before 1925. Writing under the influence of the New Poetry Movement of Harriet Monroe, Fenton Johnson was the first of the new voices. His later work, modelled on Sandbury and Masters, exceeded in realism any earlier poetry and foretokened the work of Hughes and Brown. Claude McKay's *Harlem Shadows* (1922) with its trenchant poems of social and economic injustice and protest, written in classical verse, heralded a new and powerful poetic voice. In 1924 Jean Toomer's few but startling poems in *Cane* (1923) presaged much which unfortunately failed to materialize.

Among the New Negro poets Countee Cullen and Langston Hughes stand supreme. In *Color* (1925), *Copper Sun* (1927), and *The Black Christ* (1929), Cullen displayed technical mastery and lyrical gifts unequalled among Negro writers. In later years he has applied these talents to sophisticated children's verse. Although practically of the same age and emerging as poets at the same time, Cullen and Hughes are in many respects opposites. Much more unconventional than Cullen, Langston Hughes is an experimenter in subject-matter as well as in verse form. In *The Weary Blues* (1926), *Fine Clothes to the Jew* (1927), *A New Song* (1938), and in more recent works, he has written on all manner of themes: cabaret life, racialism, protest, jazz, blues, ballads, and the class struggle. Hughes has been a highly influential figure in poetry as well as in other fields.

Among the minor poets of the New Negro Movement are Georgia Douglass Johnson, Angelina Grimké, Lewis Alexander, Jessie Fauset, Helene Johnson, Gwendolyn Bennett, Anne Spencer, and Arna Bontemps. Mrs. Spencer, the ablest of the women writers, is a modern metaphysical poet who writes outside of a school. Bontemps is a finished craftsman and able writer who unfortunately abandoned poetry for other fields. Like Cullen and Hughes, all of these writers except Mrs. Spencer expressed ideas cardinal to the New Negro Movement: the celebration of brown beauty, the delineation of a romantic and idealized Africa, and the mystical power of black inheritance.

Since 1925 several new poets of promise have been heard. Sterling A. Brown in *Southern Road* (1932) and subsequent poems proves himself an able representative of the new regionalism in American literature. Social protest and regionalism characterize his later works. Frank Marshall Davis has published two volumes of powerful social criticism in *Black Man's Verse* (1935) and *I Am the American Negro* (1937). Robert Hayden's first work, *Heart Shape in the Dust* (1940), combines technical aptitude with trenchant social criticism and is a work of great promise. M. B. Tolson, Richard Wright, and Margaret Walker are also social critics of great insight. Miss Walker's *For My People* (1942) is a book of deep sincerity written in a style both startling and prophetic.

Though the experiences of the Negro has been the material for several of America's

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

best known plays, the Negro playwright so far has contributed little to the drama. The Negro's place on the American stage has been rigidly limited to a few stereotypes. If the Negro dramatist did not conform, he found no audience. The serious Negro playwright has thus been denied the kind of apprenticeship in the theatre necessary to beget authorship. Except for musical comedies, he has made few appearances on Broadway. Forced to take to the tributary streets of the "Little" and experimental theatre, in recent years he has made some advances there.

In spite of a few sporadic attempts prior to 1925, the Negro playwright for all practical purposes began his career during the New Negro period. Encouraged by the spirit of the movement, expressed notably in the prize contests of *Opportunity* and the *Crisis*, and influenced by the new realism of Ridgely Torrence, Paul Green, and O'Neill, the Negro dramatist turned largely to one-act folk drama. Of the new playwrights the plays of the following have been most often acted by Little Theatre groups: Frank Wilson, Georgia Douglass Johnson, May Miller, Eulalie Spence, James W. Butcher, John F. Matheus, and Zora Neale Hurston. One of the most influential figures in the creation of a body of Negro plays and in building a Negro audience has been Randolph Edmonds. Wallace Thurman and William Rapp, a white writer, coproduced *Harlem* in 1929, a highly sensational melodrama which enjoyed Broadway success. Hall Johnson's *Run, Little Chillun* (1933), part opera, part ballet, part drama was another Broadway success. Langston Hughes, the most versatile of Negro dramatists, produced (in collaboration with Martin Jones) *Mulatto* (1935), a crudely effective dramatization of inter-racial mixture and violence in the Deep South. It, too, enjoyed Broadway success. The last play of part-Negro authorship to be successful in New York was *Native Son* by Richard Wright and Paul Green. It was considered one of the finer plays of the 1941 season.

In more recent years a new and promising crop of young dramatists has sprung up. Some are the products of the Federal Theatre Project, others of the Little Theatre movement throughout the country and especially in Negro colleges. Their themes have dealt with folk material and social criticism. Among them are Hughes Allison (*The Trial of Dr. Beck*), J. A. Smith and Peter Morell (*Turpentine*), Theodore Brown (*Natural Man*), Theodore Ward (*Big White Fog*), Abram Hill (*On Strivers' Row*), Thomas D. Pawley (*Judgement Day*), Arthur Clifton Lamb (*Black Woman in White*) and Owen Dodson (*Divine Comedy*).

With but few exceptions, the novels by Negroes since 1925 have dealt either directly or obliquely with American injustice. Two themes have come in for a disproportionate share of attention: lynching and "passing". Among the better known novelists are. Jessie Fauset (*There is Confusion*, 1924; *Plum Bun*, 1929; *The Chinaberry Tree*, 1932; and *Comedy, American Style*, 1933); Walter White (*Fire in the Flint*, 1925; *Flight*, 1928); W. E. B. DuBois (*Dark Princess*, 1928); Nella Larsen (*Quicksand*, 1928; *Passing*, 1930); Claude McKay (*Home to Harlem*, 1928; *Banjo*, 1929; *Banana Bottom*, 1933); Rudolph Fisher (*Walls of Jericho*, 1928; *The Conjure Man Dies*, 1930); Countee Cullen (*One Way to Heaven*, 1932); George Schuyler (*Black No More*, 1931); Wallace Thurman (*The Blacker the Berry*, 1929; *Infants of the Spring*, 1932); Langston Hughes (*Not Without Laughter*, 1930); George Wylie Henderson (*Ollie Miss*, 1935); George Lee (*River George*, 1936); Zora Neale Hurston (*Jonah's Gourd Vine*, 1934; *Their Eyes Were Watching God*, 1937); Arna Bontemps (*God Sends Sunday*, 1931; *Black Thunder*, 1936; *Drums at Dusk*, 1939); Waters E. Turpin (*These Low Grounds*, 1937; *O Canaan*, 1939); William Attaway (*Let Me Breathe Thunder*, 1939; *Blood on the Forge*, 1941); and Richard Wright (*Native Son*, 1940).

Pioneering in the effort, Jessie Fauset has delineated the middle class Negro in her novels. Writing in the *Nigger Heaven* vein, Claude McKay and Thurman have painted realistic portraits of Harlem's low class and Bohemian life. Zora Neale Hurston has written more fully than any other Negro of rural Southern life, making excellent use of her knowledge of Negro folkways and speech. Bontemp's *Black Thunder* and *Drums at Dusk* apply the technique of the historical novel to Negro heroes. *The Conjure Man Dies* by Fisher is the first detective story written by an American Negro. Written under the Steinbeck influence, Attaway's *Let Me Breathe Thunder* is unique in that it deals principally with white characters. *Native Son*, the most widely discussed novel yet written by a Negro, is in all probability also the best. Fisher, Hughes, and Wright have also written excellent short stories.

Negro biographical works since 1925 have not been outstanding. In those that have ap-

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

peared with but few exceptions, the development of race pride rather than the revealing of personality has seemed the primary object. Benjamin Brawley has done more work in this field than any other Negro writer.

Early Negro American autobiography like biographical writing tended largely to racial edification. The works have been not only success stories, but also reflectors of the social conditions confronting the Negro. In this group belong Washington's *Up from Slavery* (1900), Robert Russa Moton's *Finding a Way Out* (1920), William Pickens' *Bursting Bonds* (1923), Benjamin Brawley's *The Lower Rungs of the Ladder* (1925), and A. Clayton Powell's *Against the Tide* (1939).

But the various new trends in recent autobiographical writing have touched some of the contemporary Negro writers. Johnson's *Along This Way* is in large part social commentary. DuBois' *Dusk of Dawn* (1940) traces ideas concerning racial concepts. McKay's *A Long Way from Home* (1937) and Langston Hughes' *Big Sea* (1940) are personal records of world travelers. Angelo Herndon's *Let Me Live* (1937) is a leftist attack on Georgia and capitalist injustice. W. C. Handy's *Father of the Blues* (1941) tells much about Tin Pan Alley as well as the personal history of the author.

As the educational stature of the American Negro has increased, he has become a more versatile literary person. Within the past decade numerous well-equipped scholars in practically all of the major fields—science, sociology, education, music, history, economics —have analyzed and interpreted the Negro to himself and to America at large. Though their activities lie beyond the scope of this résumé, these scientific essays appearing in both Negro and white journals add greatly to the quality of American Negro literature.

The present day Negro writers excel their predecessors in scholarship, in objectivity, and in literary ability. Less inclined to be sentimental or oratorical and no longer propagandists except in a finer sense, they are still handicapped by the injustices of American life. As a consequence, they are still forced as honest artists and scholars to devote too much of their creative energy to the theme of protest. See F. W. Bond, *The Negro and the Drama,* 1940; B. Brawley, *Negro in Literature and Art,* 1929, *Early Negro American Writers,* 1935; S. A. Brown, *Negro in American Fiction,* 1937, *Negro Poetry and Drama,* 1937; S. A. Brown, A. P. Davis, and U. Lee (eds.), *The Negro Caravan,* 1941; J. W. Johnson, (ed.), *The Book of American Negro Poetry,* 1931; A. L. Locke, (ed.), *The New Negro,* 1925; A. L. Locke and M. Gregory (eds.), *Plays of Negro Life,* 1927; V. Loggins, *The Negro Author,* 1931; C. G. Woodson, (ed.), *Negro Orators and their Orations,* 1925; R. N. Dett, *Religious Folk Songs of the Negro,* 1927; L. Gellert, *Negro Songs of Protest,* 1936; W. C. Handy, *Blues, An Anthology,* 1926; Z. N. Hurston, *Mules and Men,* 1935; G. B. Scarborough, *On the Trail of Negro Folk Songs,* 1928; T. Talley, *Negro Folk Rhymes,* 1922; N. I. White, *American Negro Folk Songs,* 1928; J. W. Work, *American Negro Folk Songs,* 1940. —A.P.D.

**AMERICAN NEGRO MUSIC.** In common form, what is called "Negro music"? Spirituals, shouts, work-songs, plantation numbers, minstrel melodies, rag-time and blues are all blended in a polyglot answer.

But what are the characteristics of Negro music? Syncopation (rhythm), the pentatonic scale and the blue note; the latter being extensively employed in the modern *jazz* and *swing,* which are not musical forms, but a method of expressing certain types of music.

The somewhat mysterious **blue note** (flatted 7th and minor third), first introduced in "The Memphis Blues" can now be traced back to the Negro's imposition of the five tone scale on the white man's hymns: common, short and long metres. Here it is heard in the colorful "wording out" of "long metres" by unsophisticated and backwoods preachers who intoned the lines.

The Fisk Jubilee Singers, immediately after the Civil War, were the first to introduce the spirituals in their concert tours of America and Europe. And, in their book—"The Story of the Jubilee Singers" (with their songs included), is an important example — "Roll, Jordan, Roll," which as a spiritual carries the flatted 7th in the third measure and elsewhere, but this has been deleted or changed to a 6th in subsequent arrangements by white harmonists and many Negro composers, influenced by the music of the Caucasians.

The five string **banjo**, a Negro creation, was used to accompany the plantation and

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

minstrel songs until the piano became a fixture in his home. His love of syncopation on the banjo was transferred to the piano, and since the five black notes of the piano keyboard represent a five tone scale, it is understandable how rag-time songs came into being, and were made popular in the last decade of the 19th cent.

The chorus of "Under The Bamboo Tree," a popular song by Bob Cole and J. Rosamond Johnson, is a five tone scale, influenced by the melodic and rhythmic values in such spirituals as "Nobody Knows The Trouble I See."

At the turn of the 20th cent., the Negro's technique on the piano was expanding so as to permit the creation of difficult instrumentals and tricky rhythms usually played on the black keys and too difficult for the white pianists. Composers of both races transposed and orchestrated these instrumentals into practical keys, and rag-time became more popular. **Rag-time** was exaggerated rhythm with less melody and no blue note. Almost every city had its Negro composer of rag-time. It flourished while many of its songs held the race up to ridicule, and fell into disrepute because of this innovation.

However, it remained for the dark skinned Scott Joplin to assert his mastery in "Maple Leaf Rag," "Euphonic Sounds" and other instrumentals too full of syncopation for musicians of his day and time, and for the matchless Irving Berlin to redeem this catchy rhythm and apt song style with his "Alexander's Rag-time Band." Upon examination it will be seen that the melody of "Alexander's Rag-time Band" discarded the syncope (less Negroid). Rag-time is only reflected in the broken tempos, scattered rhythms and catchy words of its general composition.

While America was glorifying rag-time, and Europe was glorifying America because of it, the blue note was budding in the folk life and lore of the South's Black Belt. Wails about the 'boll-weevil' became the song of the plantation replacing James Bland's 'corn and taters' in "Carry Me Back To Ol' Virginny."

"O, De Mississippi River's So Deep and Wide" was the fore-runner of a Negro form emphasizing "All The World Is Sad and Dreary" — Foster's "Swanee River." The prisons, chain-gangs, bar-rooms, levees and honky-tonks were groaning beneath the weight of a new song that was to temper the hearts of the world because of suffering.

The **spirituals** were born of suffering, and that is why the great baritone and composer of "Deep River," Harry T. Burleigh, called the spirituals "first cousins" of the blues.

In our homes are phonograph records by Bessie Smith, queen of the **blues**; Ma Rainey, mother of the blues; Mamie Smith, the first of her race to record the blues; and the ever popular Ethel Waters and Louis Armstrong. Who taught them how to sing the blues? There was no school other than the white man's "long metres" on which for every single written note they had sung from five to nine notes of the pentatonic scale. They had heard the preaching of the Elders, and the wording of the Hymn. That 'blue' note was instinctive and inborn. The rhythm of the shout is in their blood. They speak their mother's tongue.

American culture has felt the influence of music and song derived from and inspired by folk dances like "Jump Jim Crow," "Juba," "Pasamala," "The Cake Walk," "Jennicoula," "Walking the Dog," "Ballin' the Jack," 'The Shimmy," "Charleston," "Black Bottom," "Eagle Rock," "Buzzin' 'Round," "Trucking" and the "Lindy Hop" which introduced "Jitterbug and Jive."

Since 1820 these dances and this music have been heard in a type of shows now known theatrically as 'Musical Comedies.' There are still living those who remember Billy Kersand's "Minstrels," Isham's "Octoroons," Sam T. Jack's "Creoles" and Black Patti's "Troubadours." In the late 90's, Negro producers with their productions set a new tempo. These were: S. H. Dudley's "Smart Set;" Ernest Hogan's "Rufus Rastus" with Joe Jordan collaborating; Cole and Johnson's "A Trip to Coontown" and Williams and Walker's "Sons of Ham." The current century ushered in Rogers and Shipp's "Bandana Land;" Williams and Walker's "In Dahomey" music by Will Marion Cook; "Runnin' Wild" Jimmy Johnson and R. C. McPherson; "Shuffle Along" music by Noble Sissle and Eubie Blake, starring Florence Mills, and "Hot Chocolates" music by Thomas "Fats" Waller and Andy Razaf.

Today the radio and talking pictures have replaced vaudeville and musical productions of yesterday, but the swing bands, white and black, bring the beat of the African jungle-drums into every home.

No longer do we travel to the cotton fields of the south to hear the spirituals and their singers. They can be heard and seen in moving pictures like "Hallelujah," "Green Pastures," "Cabin In The Sky" and "Stormy Weather."

More than a hundred and fifty years ago, an African slave girl, Phillis Wheatley, the first American poet of her race wrote these lines:

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

"'Twas mercy brought me from my
Pagan land,
Taught my benighted soul to understand
That there is God, that there's a Savior
too;
Once I redemption neither sought nor
knew."

In his newly found Christianity, influenced by Bible stories, the African adapted them to his folk forms, and gave us the **spirituals**, which are being kept alive today by such great artists as Marion Anderson, Roland Hayes, Hall Johnson's Choir, Dorothy Maynor, Abbie Mitchell, Paul Robeson and the Southernaires.

Behind these and other great singers are works of recognized composers and arrangers: Burleigh, Boatner, Cook, Dawson, Dett, Dorsey, The Johnsons, Florence Price, Ryder, Still, Stor, White and the Work Brothers; and back of all of this, a music publishing company founded by W. C. Handy, dedicated to the proposition of preserving all forms of music with which his race is credited.

Anton Dvorak, Coleridge Taylor, N. Clark Smith and H. Lawrence Freeman pointed the way, which the genius of George Gershwin has lighted with rays, from jazz idioms of the James Reece Europes, the Dixieland Jazz Bands, the Cab Calloways and the Duke Ellingtons. Gershwin took a drama based on lowly Negro life—"Porgy and Bess" and developed an opera "Porgy" which reflected the tempo of America, and expressed this in a score that only Negro voices can interpret.

From the vast reservoir of this folk music which James Weldon Johnson called the greatest in the world, may be drawn all the material which any composer needs from symphony to swing. —W.C.H.

**AMERICAN NEGRO THEATRE.** *The beginnings.* The story of the Negro in the American theatre is an integral part of the history of the American theatre. The earliest colonizers and those who settled the West had little time for entertainment involving mimicry and impersonation; their energies were devoted to the development of the country. Lacking an indigenous theatre which could serve as an object of imitation, neither the Negro slave nor the free Negro had a model on which to draw. The Negro's dramatic talents could not be developed in such an atmosphere and it was not until a flourishing theatre tradition took root in urban centers that the Negro theatre emerged. The political and economic factors of slavery loom large in the beginnings of the Negro theatre, since the early American theatre as a medium of entertainment was molded by New York merchant interests and the requirements of Southern plantation life.

*Slavery and Emancipation.* Throughout the history of the Negro theatre can be seen a stage on which the players were not all Negroes. In the earliest American drama, the Negro occupied the unenviable roles of slave, servant or entertainer, usually to create comic relief. The content of this early drama was fashioned by the ideology of the slave-owning class. Up to 1800 there were only two plays—*Yorker's Stratagem* and *The Fall of British Tyranny*—which depicted the Negro as anything but an acquiescent slave. All other American drama describing Negro character was designed for cheap entertainment. This sterile environment precluded the development of Negro actors or dramatists until for such time as the patron producing class could transfer its support.

The first legitimate Negro theatres mark a slow progress through many hardships, for they were attempts by Negroes in the North to eradicate the comic relief and to come out as actors in a worthy tradition. The African Free Company organized in 1821 in New York was perhaps the first Negro company; the company played Shakespeare and other classics under the leadership of James Hewlett the principal actor. Ire Aldridge, one of the greatest Shakespearean actors of all times, as a young man in this company played Rolla in Sheridan's *Pizzaro.* Aldridge also played Othello to the *Iago* of Edmund Kean all over the European continent, and was made a Chevalier by the King of Prussia. The free Negroes of New Orleans had their own theatre in this southern center of antebellum culture. The *Diegarias* of Victor Sejour (1817-1874), who was one of the greatest dramatists of his day, was the opening drama (1844) of Le Thèâtre Francais. Sejour's *Chute de Sejan* (1844), *Richard III,* and *Andre Gerard* were successful plays. His *Les Volontiers de 1814,* a drama of five acts with an American setting featuring the volunteers against the British in the Battle of New Orleans, was presented in 1862. Virginia Girardeau, a celebrated Creole actress, played tragic roles in the 1830's at the Théâtre de la Renaissance and is said to have toured America.

Up to the Emancipation Proclamation the interest which centered around the Negro theatre was owing largely to the influence of the Abolitionist movement. The first Negro dramatist, William Wells Brown (1816-1834)

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

wrote *The Escape or a Leap From Freedom* (1858), a shoddy piece of dramaturgy. Plays which directly reflected the slavery issue were Harriet Beecher Stowe's *Uncle Tom's Cabin* and *Dred,* Mrs. Swayze's *Ossawatomi Brown* and Boucicaults' *The Octoroon.* This theatre had a function which it performed, even though it retained the vestiges of stereotyped Negro character comic, namely, faithful slave and tragic mulatto. The *Emancipation Proclamation* and the consequent change in American society brought about changes in the function of American drama.

Negro dramatists and actors continued their contributions to the New Orleans Theatre. *Lydia,* a three act drama by Adolphe Duhart was presented in 1866 at the Théâtre d'Orleans. There were also plays by Edmond Dede, Samuel Snaër, Charles Veque, Eugene Macarty during the Reconstruction period. These were lengthy plays, usually for benefits and lasted far into the night.

*Minstrelsy and Musicals 1890-1915.* Blackfaced minstrelsy, an indigenous product, was the reflection of the treatment of a class considered inferior. The patron-artist relationship had not yet developed in this society, so that it was not possible for Negroes to have dignified roles. Blackface comedy and minstrelsy dominated the American theatre scene for a long period and many Negro performers followed in the wake of the white minstrels who monopolized this field. The source of the minstrelsy was the Negro folk; and the later Negro companies with blacked faces exploited this vein of theatre for many years. The Georgia Minstrels and Callender's Consolidated had Billy Kersands, Sam Lucas and the best known of them all, James Bland, composer of *Carry Me Back to Ole Virginny* and *Pretty Little South Carolina Rose.*

This later period reflected the Negro's reactions to his understanding of the dramatic forms and of the varying functions of the stage. In the plays of Steele Mackaye, Negroes were treated as human beings; in those of Edward Harrigan, they were pictured as buffoons; in the minstrel troupe and in the Negro musical show, the Negro himself carried forward ante-bellum blackface tradition. The patron class determined both the function and the actual material which the dramatist and actors employed.

The Negro show became the vehicle for Negro dramatic talent. Paul Laurence Dunbar, Will Marion Cook, Ernest Hogan, J. Rosamond Johnson, Will Vodery, Miller and Lyles wrote the words and music for these shows from 1890 to 1915, a period in which the cake walk, the coon song, the Jonah Man and the begimings of jazz were dominant. One of the greatest performers was Bert Williams of whom W. C. Fields said, "he was the funniest man I ever saw and the saddest man I ever knew." George Walker, Bob Cole, Ernest Hogan, S. H. Dudley, other great artists, felt compelled to cork their faces, soft-shoe dance and clown before white audiences. The first New York show was the *Creole Show* from the Chicago World's Fair. *Oriental America* was the first Broadway Negro show. Ernest Hogan's *Rufus Rastus,* Bob Cole's and J. Rosamond Johnson's *A Trip to Coontown* played Worth's Museum. *Abysinnia,* by Bert Williams and George Walker, broke records at Koster and Bial's. The function of the theatre in this period was to entertain an affluent class, hence the Negro show kept closely to the blackface caricature of malapropisms and dice-playing.

*The Negro Producing Theatre, 1915-1925.* Barred from participation in a flourishing American theatre and without their own playwrights, Negroes sought devices and turned to their own producing shows. The first Negro theatres in the new century were stock-producing companies designed to counteract the race-baiting dramas of Thomas Dixon, to provide employment and to show Negro audiences an array of thespian ability. The repertory of Chicago's Pekin Theatre, Mrs. Sherwood Anderson's Ethiopian Art Players, the Anita Bush Company and the New York Lafayette players gave rise only to imitativeness and reflected the individualism of middle class culture. These plays, *The Count of Monte Cristo, The 13th Chair, Madame X, On Trial, Dr. Jekyll and Mr. Hyde* had no relation to Negro life, but they gave opportunities and they served as an apprentice home for such distinguished actors as Frank Wilson, Charles Gilpin, Rose McClendon, Evelyn Preer, Abbie Mitchell and Edna Thomas. Negro drama did not come of age until later, when the artistic period between 1920-1930 had developed an integrated style and a language which were more attuned to the times.

*Transition in American Drama, 1920-1930.* Negro theatre workers, actors and producers, together with the white dramatists who realistically explored Negro life, constituted a transitional phase in Negro drama. White dramatist-poets, such as Ridgely Torrence, who wrote *The Rider of Dreams, Granny Maumee,* Paul Green, who wrote *No Count Boy, In Abraham's Bosom,* Eugene O'Neill,

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

who wrote *Emperor Jones, All God's Chillun Got Wings,* represented emergence from a folk art period. Plays by white writers who were concerned with social justice—James K. Millen's *Never No More,* Peters' and Sklar's *Stevedore,* Wexley's *They Shall Not Die,* Paul Green's *Hymn to the Rising Sun* — overshadowed the miracle dramaturgy of Roark Bradford's *Green Pastures* and the folk dramatization of Dubose and Dorothy Heyward's *Porgy* (1928). Distinguished actors like Opal Cooper (*The Rider of Dreams*), Frank Wilson, Rose McClendon, Abbie Mitchell (*In Abraham's Bosom*), Charles Gilpin (*Emperor Jones*), Paul Robeson (*All God's Chilluns Got Wings*), Leigh Whipper, Rex Ingram, Georgette Harvey, Jack Carter, Edna Thomas (*Stevedore*), Richard B. Harrison (*Green Pastures*), performed in these plays.

Negro playwrights in the 1920's became more articulate and concerned with the realism of Negro life in the American scene. The tone of this writing was racialistic, a result of the failures and disappointments suffered by Negroes in a post-war world. Poets, novelists, musicians and musical comedy writers, some of whom belonged to what Alain Locke called the *New Negro Movement,* emerged to express the disillusionments of post-war Negro life. *Shuffle Along* (1921) did not display any such dejection. A success from the start, it was written, produced, directed and acted by Negroes, giving the inimitable Florence Mills her first starring role. *Blackbirds, Running Wild, Brown Buddies, Chocolate Dandies,* written and composed by Noble Sissle and Eubie Blake appeared in the 1920's and featured such stars as Aida Ward, Adelaide Hall, Johnny Hudgins, Inez Clough and the unforgettable danseuse, Josephine Baker.

The social protest drama of white dramatists encouraged Negro playwrights to write straight forwardly of the plight of Negroes. Frank Wilson's *Sugar Cane* (1925), Willis Richardson's *Broken Banjo* (1925), sought to place on the stage the emotional realities of Negro life. The only plays written by Negroes to reach Broadway with any success were Wallace Thurman's *Harlem* (with William Jourdan Rapp), a lurid melodrama (1929), Hall Johnson's *Run Little Children* (1933), a highly successful treatment of Negro religious and folk life and Langston Hughes' *Mulatto* (1935), a tragic and sometimes heavy account of the realities of miscegenation.

*The Little Theatre, 1920-1942.* Growing up with the national drama consciousness of the 1920's and along with the post-war **New Negro Movement,** was the Negro Little Theatre. The appearance of the Negro Little Theatre was coincident with the flourishing Little Theatre Movement. This movement affirmed the relationship of patron and artist in a changing middle-class society and determined the functions and material forms taken by the theatre workers. The first of these groups, the Krigwa Players, sponsored by W. E. B. DuBois as part of the *Crisis* program, did not survive long. Other groups in Washington (the Howard Players organized in 1922 by Alain Locke and Montgomery Gregory) Boston, Philadelphia and Chicago, were more successful, but short-lived. Only the Gilpin players in Cleveland, under Rowena Jelliffe, dared to act plays of Negro life; elsewhere the content of the "drama" was dependent on the whims of the patron class. Later, the Negro theatre movement spread into the Negro colleges, propelled by Sterling Brown (Howard University) and Randolph Edmonds (Dillard University) who founded the Negro Intercollegiate Drama Association. Negro instructors, Owen Dodson (Hampton), Anne Cook (Atlanta), M. Ross (Fisk), James Butcher (Howard), realizing the possibilities of a Negro theatre, wrote their own plays, with much success. The late 1930's and the present period saw the continued development of the Negro Theatre Movement with such groups as the Bucket Theatre (near Tuskegee), the Rose McClendon Players (New York), the Negro Playwrights Company (New York), the American Negro Theatre (New York) and the Harlem Suitcase Theatre, which point to 'hope ahead' in a healthy direction.

*Federal Subsidy, 1935-1939.* The Federal Theatre Project, begun in 1935 as a result of the serious disruptions caused in the theatre world, moved in the direction of a genuine People's Theatre. The expressed purpose of the project was to give 'to the people access to the arts and tools of a civilization which they themselves are helping to make.' The project, a great boon to a depressed Negro theatre, gave employment and encouragement to Negro artists in every field, and 'a special program for Negro companies.' No other project or endeavor aided the Negro theatre as the Project did. Units were set up in Seattle, San Francisco, Los Angeles, Chicago Birmingham, Raleigh, Hartford, Boston, Newark and New York. The plays of Negro authors—Frank Wilson's *Brother Mose,* Smith and Morell's *Turpentine,* Ward's *Natural Mag*

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

and *Big White Fog,* Bontemps and Cullen's *The Conjure Man Dies*—were acted before thousands all over the country. There were musicals, dance groups, mobile shows, puppet groups, well-known classics and modern plays. *Haiti* by William Du Bois, was highly successful; *Macbeth,* directed by Orson Welles and John Houseman, was colorful, different and unforgettable. *The Swing Mikado,* a Chicago version with modern trappings, played to millions. The demise of the Federal Theatre Project brought to an end what had begun as the richest promise of the Negro theatre.

*The Present and the Promise.* Negro writing in the 1930's followed the general trend of white proletarian literature and the direction of left-wing drama. Most of the Negro creative writers had been poets and novelists, working in forms well suited to middle-class life. Now the drama came to be influenced by the novel, expressing the complex desires, fears and struggles of the undifferentiated Negro masses. Class-conscious writers turned to the blunted and frustrated forms of Negro life and explored the inner facets of Negro experience. Langston Hughes' later work, especially his *Don't You Want to be Free,* expressed the desire of people for real freedom. Theodore Ward's *Big White Fog,* went down into the depths of Negro working class ambitions and experience. *Native Son,* a searing and gripping dramatization (Paul Green and Richard Wright) of the Wright novel about the slum-bred Bigger Thomas, brought to a focus the essence of Negro experience. The moving principle of *Native Son* was the source of its tragedy, its beauty and its creative power. *Native Son* regarded the Negro proletarian as part of a class-system, it revealed stark tragedy; but it also promised freedom, it trumpeted a call to action and it expressed the consciousness of the Negro people.

Shakespeare's universal appeal and message can be noted in the Negro theatre from the time when Ira Aldridge played Shylock until 1930 and 1942 when Paul Robeson enacted Othello. The Shakespeare Tercentenary of 1916 included Edward Wright's Shakespearean repertory at the New York Lafayette Theatre. Not since 1826 had an American Negro in an American production played Othello. In 1930, under Maurice Browne (who played Iago) Robeson gave a matchless London performance. In 1942, Robeson appeared under the great Shakespearean director, Margaret Webster (who played Emilia) in the role of Othello at Brattle Hall, Cambridge, Massachusetts and at Princeton University. His Othello was played with a fiery spirit and a strength of interpretation which showed the black Moor moving with dignity, towering above the petty jealousies of Venetian life. Paul Robeson, as a great actor, played the main role of a universally valuable work, in a mixed cast and proved that Shakespeare was universal in more ways than one. Robeson's Othello was a plea for equal rights in every walk of life and a clarion call for the honor of American Negroes. This production was a landmark, a triumph for the Negro in the American theatre and a herald of a great future in the annals of the theatre. See S. A. Brown, *Negro Poetry and Drama,* 1937 and *The Negro Caravan* (with A. P. Davis and Ulysses Lee), 1941; R. Edmonds, *Seven Plays for a Negro Theatre,* 19 ; H. Flanagan, *Arena,* 1941; J. W. Johnson, *Black Manhattan,* 1930; A. Locke, *The New Negro,* 1926; the Negro Drama and Broadway, *Theatre Arts* (Oct., 1941); *Theatre Arts* (Aug. 1942); R. Torrence, *Three Plays for a Negro Theatre,* 1917. *Louisiana,* A State Guide, 1941.—E.C.H.

**American organ.** *Mus.* A reed organ in which the sound is produced by air sucked through the reeds by a bellows.

**American Scene movement.** See regionalism.

**American standard pitch.** See ACOUSTICS.

**American ware.** See CERAMICS II.

**ammonia.** Because of its alkaline character, ammonia, usually as ammonium hydroxide, is frequently used for general and destructive cleaning of oil paint. In some form it may have been an ingredient of cleaning agents for pictures since the Renaissance. —G.L.S.

**Amor.** Cupid.

**amorino** (It.). An infant cupid; common in Italian 16th cent. sculpture and painting.

**amphitheatre** (L. *amphitheatrum,* from Gr. *amphi,* on both sides—*theatron,* a theatre, the term compounded by the Romans despite the lack of any precedent in Greek architecture for these buildings). An unroofed oval or circular building with seats rising in tiers continuously around an open space or arena for the exhibition of gladiatorial and mimic naval combats, fights between wild animals, and other forms of spectacular public entertainment during the period of the Roman Empire. Amphitheatres existed in every Roman town of the slightest importance, from the Near East to Spain, from North Africa to

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

Britain, and those which still stand are the most monumental examples of Roman architecture: the Colosseum of Rome (72-80 A.D.), the amphitheatres of El-Djem (Tunisia), Verona, Pola, Nimes, Pompeii, Capua and Cassano (Sicily) are the most complete and noteworthy. The amphitheatre was generally oval in plan, with gates opening onto the arena at either end of the major axis, which reached an extreme length of 626′6″ at Pozzuoli. The arena itself, covered with sand, was frequently pierced with trap-doors to facilitate the display of illusions; it was often capable of being flooded for the presentation of naval battles, ***naumachia;*** while in some cases extensive substructures contained dressing rooms for gladiators and cages for wild animals. The surrounding ***visorium***, at first built of wood or simply a terraced hillside from which the arena had been excavated (as at Sutri), was from the 1st cent. onward constructed of brick or stone. The moat which had surrounded the arena for the protection of the spectators was replaced by a wall or ***podium,*** so that the first row of seats was elevated ten or twelve feet above the arena. The *visorium,* supported partly on a solid substructure and partly on a complex of arcades, was at Rome divided into distinct stories, the lowermost reserved for the Emperor (who had a raised loge, ***pulvinar***), the Senators and the Vestal Virgins; the next level was reserved for priests, knights, and the lesser magistracy; above them sat ordinary citizens, the *popularia,* with a special section for women; while the slaves were allowed to stand on the roof of the colonnade girdling the uppermost story. The Colosseum could accommodate nearly 50,000 spectators, though 15,000-20,000 was the average for the larger provincial amphitheatres. Access to the *visorium* was in all amphitheatres provided through ***vomitoria*** which occurred in every third or fourth arch in the outer wall; the seats, usually faced with marble, were divided into wedge-shaped sections by stairs. On the outside of the attic wall of the Colosseum, 157′ above the ground, are consoles and stone rings for the support of the ***velarium*** or awning which in case of rain or overhot sun could be stretched across the whole theatre by sailors of the fleet who were always in attendance for this purpose. The outer arcaded walls of the amphitheatres, of noble beauty in even their present despoiled condition, were customarily faced with marble and ornamented with statues and superimposed engaged columns of the Doric, Ionic and Corinthian orders, or with square buttresses. These stupendous monuments served throughout the Middle Ages and in Rome until so late as 1750 as convenient stone quarries, hence the high mortality and often total disappearance of the great majority of these buildings so substantial and once so numerous. The Roman amphitheatre is the direct inspiration of numerous modern athletic stadia in Europe and America and of the bull-rings of Spain. The designation of modern open-air theatres on the Greek model as amphitheatres is improper. —T.A.H.

**amphora.** A large Greek jar with two handles, used for storing wine, grain, oil, etc. This is one of the earliest known vases, found all over the Greek world. Among the most interesting types are the geometrically decorated Dipylon vases (q.v.) found in Athens; the seventh-century amphorae with long, eggshaped bodies; the Panathenaic amphorae, decorated with a picture of the warrior-goddess Athena on the side, given as prizes to winners at the great Athenian festival; the elegant Nolan vases with their slim, long neck; the Apulian, egg-shaped, with thick mouths and the neck merging into the shoulder; and the twisted-handled Campanian amphorae. Many of the most prominent vase painters decorated these vases, including Nikosthenes in late 6th cent. Athens, whose amphorae were notable for their crisp, metallic shapes and band-handles.

In Oriental art the term is applied to vase forms that approach the Greek original in shape. —W.R.A.

**amplitude.** See ACOUSTICS.

**amulet.** A charm case or propitious ornament, generally worn around the neck; greatly varying in forms and in material. See JEWELRY.

**amure** (Fr. *amure,* armor). A textile with rep or twill background. The pattern is made of warp threads floated on the surface. Small patterns usually made on a Jacquard loom.

**amusia.** A condition in an individual marked by inability to follow or to appreciate music. Sometimes called tone-deafness.

**amyl acetate.** Distinguished by its penetrating sweet odor which gives it the common name, banana oil, amyl acetate is well known as a solvent for the synthetic resins. —G.L.S.

**an** (Ch.). A bronze box or casket for small objects.

**anadem.** A wreath; garland.

**anaglypta.** See relief.

**analogous color scheme.** See COLOR.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

**analytical cubism.** See cubism.

**ānanda laharī.** See MUSICAL INSTRUMENTS.

**Ananta** (Skr.). In Hindu mythology the infinite, the endless.

**Anasazi** (Navaho, ancient ones). A term applied to the Basket Maker—Pueblo peoples. See Pueblo Art.

**anchor.** The dart of an egg-and-dart molding. In heraldry, used as an emblem of hope.

**ancient modes.** See scales and modes.

**aṇḍa** (Skr.). See stupa.

**Andhra art.** See INDIAN ART.

**anecdote.** See American folk forms in literature.

**angelic hymn.** The hymn sung by the angels at Chirst's birth (*Gloria in excelsis*).

**anglaise** (Fr.). A lively country-dance in "English" style, in 2/4 or 3/4 time.

**angle shaft.** A corner bead, often enriched and sometimes with capital and base.

**Angora cloth.** A variety of cloths made from Angora wool or from mohair and similar fibres.

**angular perspective.** See PERSPECTIVE.

**animism.** See PRIMITIVE ART.

**ankh.** A T-shaped or tau cross with a loop at the top; symbol of life in ancient Egypt.

**annam.** See SOUTHEASTERN ASIATIC ART.

**Anna Selbdritt.** German for "St. Anne with Two Others", the two others being Mary and the Infant.

**annealing.** See GLASS AND GLASSMAKING.

**annular vault.** A vaulted enclosure with its plan having the form of an arc of a circle.

**anonymous.** (1) Nameless; or of unknown name (1601). (2) Of unknown authorship (1676). (3) Illegitimate or specious; *rare* (1881). —R.W.C.

**answer.** The reply given in a fugue (q.v.) by the second voice to the antecedent of the first voice.

**anta.** A pilaster or pier terminating a wall and usually having a capital and base. A portico having columns between the antae is said to be *in antis*. —O.M.S.

**Antaeus.** In Greek mythology, a giant of invincible strength as long as he remained in contact with his mother, Ge (Earth); overcome by Herakles who lifted him from the earth and crushed him in the air. —L.T.S.

**antecedent.** The theme of a fugue or canon (q.v.), as proposed by the first part of any motive which is later imitated.

**antechamber.** A small room or vestibule usually between the outer entrance and an interior doorway to a larger chamber.

**antefix** (Lat. *ante,* before + *fixus,* fixed). In classical architecture, the upright decorative termination, at the cornice, of the covering tiles of the roof; usually in the form of a palmette, sometimes in the form of a human or satyr's head. —L.T.S.

**antetemple.** The vestibule or narthex of a temple or church.

**anthem.** A piece of sacred music usually founded on biblical words, with or without instrumental accompaniment and having various forms: (1) Anthems for double choir, the choirs frequently answering each other. (2) Full anthems, consisting wholly of chorus, accompanied or not. (3) Full anthem with verses, certain parts of which are sung by solo voices, although beginning and closing are choruses and the chorus predominates throughout. (4) Verse anthems, in which the verses predominate the choruses. (5) Solo anthems, in which the solo part predominates, although the chorus always concludes them. (6) Instrumental anthems, those accompanied by instruments other than the organ. The anthem is essentially an English product. —F.M.G.

**anthemion.** See palmette; lotus and palmette.

**antimony pigments.** The best known of these historically is Naples yellow or antimony yellow, which is a lead antimoniate. Its color runs from an orange to a pale, almost green-yellow. Its history is long. As a glaze in ceramics, it has been found in the ruins of Babylonia and Assyria, and Egyptian glass of the 19th dynasty is known to have contained this combination of elements. To what extent antimony was used in pigments for painting has not been generally decided because of the difficulty of distinguishing analytically between

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

this and the closely related lead oxide known as massicot. There is evidence, however, that a yellow lead antimoniate figured in the color of pictures at least from the late Renaissance. A few modern paints are also derived from this element. One is an antimony oxide, a white pigment used industrially but not introduced to the artist's palette. A somewhat similar position is taken by antimony sulphide, a substitute for mercuric sulphide, or vermilion. —G.L.S.

**antinode.** See ACOUSTICS.

**antiphon.** See psalmody.

**antiphonal psalmody.** See psalmody.

**antiphonarius cento.** See MEDIEVAL MUSIC.

**antiphonary.** See MEDIEVAL MUSIC.

**antiphony.** Responsive singing by two voices, choirs or a divided choir.

**antiquarium.** A building or room in which antiques are displayed. Also a cabinet or case containing antiques.

**Antwerp blue.** See Prussian blue.

**Antwerp school.** A school of art that developed in Antwerp. From 1480 to 1505 a group of painters came to Antwerp from Cologne, Westphalia, the lower Rhine and Bruges. It succeeded Bruges as the center of Flemish art. Among the artists who practised there were Quentin Massys, Mabuse, Joachim Patinir, Hendrik Bles, Pieter Breughel, Jan Massys, Antonio Moro, Rubens, Van Dyck, Frans Snyders, Gerard Seghers and many lesser known artists. —R.L.W.

**Anubis.** Egyptian jackal god of the dead.

**Apache art.** The Apache (possibly Zuñi *apachu,* enemy), like the Navaho, were Athapascan nomad hunters who entered the Southwest from Alaska and Canada six or seven hundred years ago. Unlike the Navaho, they were non-assimilative and continued to be rovers and raiders, especially after the introduction of the horse. They never coalesced into a geographic unit but remained divided in small bands of warlike expert horsemen who roamed over Arizona, New Mexico and western Texas. Though some of them cultivated a limited amount of corn, for a large part of their food they depended upon native game and plants. Hence it is not surprising that their chief art was basketry, and that, too, restricted to the women. The function of the baskets was to supply containers and carriers for a roving people for whom pottery was impracticable. Cottonwood, willow and yucca furnished the materials. Their coiled bowls and jars show a simple vigor of shape and design that seems consistent with the tribal character. Though the styles vary somewhat among the different bands, in general the bowls show a design boldly set forth in angular geometric patterns which frequently radiate or spiral outward from the center. Small figures of highly conventionalized men and animals are scattered almost at random over the surface like repeat patterns within the geometric framework. In their ceremonials the Apache reveal a boldly dramatic quality; and the Mescalero group, in the costumes and movements of the dance of the four nights' puberty rites of Apache girls, made the same use of straight line and angularity as is seen in the baskets. See F. H. Douglas, *Apache Indian Coiled Basketry,* Denver Art Museum Leaflet No. 64, 1934; O. T. Mason, *Aboriginal American Basketry,* U. S. National Museum, Annual Report, 1932; C. Wissler, *The American Indian,* 1938. —H.G.

**apadana.** *Persian arch.* A columned hall supporting wooden roof of heavy timbers and wattling, combining the judgment-hall and the audience hall of the king.

**Apelles.** A Greek 4th cent. B.C., painter, famous, according to ancient writers, for the realism of his pictures. None of his work survives. —W.R.A.

**Aphrodite** (L. *Venus*). The Greek and Roman goddess of love and beauty, favorite subject of Greek sculptors and vase painters. Among the most famous statues of her were Praxiteles' Aphrodite of Cnidus, of which a copy is in the Vatican; there are many Hellenistic variations of the type, including the Aphrodite of Melos in the Louvre and the Aphrodite of Cyrene in the Terme Museum, Rome. She has been popular as a subject in European painting, as in Botticelli's *Birth of Venus* and pictures by Giovanni Bellini, Raphael, Correggio, Giorgione, Rubens and Bouguereau. Scores of sculptors from Sansovino to Maillol and Manship have likewise given this title to their representations of attractive female figures. She has often been accompanied in art by her son, Eros (Cupid). —W.R.A.

**Apis.** Sacred bull worshiped by the ancient Egyptians.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

**Apollo.** One of the most important of Greek and Roman gods, the divinity of light and healing, music, athletics and prophecy. His chief attributes were the lyre, bow, laurel wreath and tripod. He was a favorite subject of Greek sculptors and vase painters, who represented him usually either as a vigorous young athlete or in more lyric fashion as a graceful musician, leader of the Muses. Outstanding sculptural representations are the majestic Apollo from the pediment of the Temple of Zeus at Olympia, the Apollo Slaying a Lizard by Praxiteles, and the Hellenistic Apollo Belvedere. By European painters he has frequently been pictured as the guiding spirit of music and poetry, as in Raphael's Parnassus, in the Sistine Chapel, Rome. The Apollo and Daphne story was illustrated by Giorgione. Among sculptors, Sansovino, Bernini, Thorvaldsen, and Flaxman represented him as a graceful youth; but Michelangelo realized his strength of body and spirit, and in modern times Barye, Rodin and Bourdelle have recaptured something of the vigorous personality of the early classical Apollo.
—W.R.A.

**Apollonian and Dionysian.** A distinction made by Nietzsche in *The Birth of Tragedy* between the two ways of artistic self-revelation that nature makes of itself. He refers to the Apollonian art-world of *dreams* and the Dionysian art-world of *drunkenness,* these characterizations of existence being analogous to the experience of nature as appearance, order, Being, on the one hand, and as reality, chaos, Becoming, on the other. The human artist is to be regarded as an imitator of these two and is thus the producer of either type of art; only the tragedian combines the two—as was the case in Attic tragedy. In his later thought, which is less Schopenhauerian, Nietzsche develops a psychology of art in which dreams are regarded as foreshadowing aesthetic intuition and aesthetic orgy. On this basis he regards dramatics, music, lyrical poetry, and dancing as Dionysian art, and sculpture, epic poetry, and painting as Apollonian art—architecture, being a product of pure will, is excluded from this distinction. By transcending the *principium individuationis,* the ordered aspect of nature (the Apollonian), the artist, in aesthetic mystical ecstasy, becomes one with the Heraclitean flux, the true reality (the Dionysian). Only the rhapsodic experience of the Dionysian aspect of existence makes the latter bearable. Truth, which is to be found in the Apollonian (rational) aspect of existence, is destructive of living in its deepest sense. —H.G.S.

**apollonicon.** An orchestrion (automatic organ) of large size and with five or six keyboards.

**apotheosis.** The act of deification; elevation of a man to the rank of an immortal. First introduced into art by the Romans in connection with emperor worship; reintroduced in 16th cent. Italy and later in 17th cent. France as a metaphorical celebration of the absolute prince. Spread from France to other European countries. —R.B.

**apotropaic eyes.** In Greek art, a human eye with lids and eyebrow painted on objects, especially vases and prows of ships, to ward off evil.

**apotropaic imagery.** Any abstract or representational configuration designed to ward off evil influences and to frighten away ghosts; often takes the form of human or animal faces and of their staring eyes (relation to hypnotism). A magical device, apotropaic representation is based on the assumption that an image has the power of what it represents and that demons are combatted best by their own visible likeness. Universal in all primitive art. —R.B.

**apotygma.** See wool.

**Apoxyomenos.** (Gr. *apo* + *xyo,* to scrape off). Name given to a statue in the Vatican. It is presumed to be a copy of a famous statue by the Greek sculptor Lysippos. It represents a young athlete in the act of scraping himself with the so-called *xystris* or *strigil* after a contest. The statue is frequently used to illustrate the change of style in the beginning of the Hellenistic epoch. Illustrated in: Gisela M. A. Richter, *The Sculpture and the Sculptors of the Greeks,* 1929, Figs. 739, 742, 743.
—L.L.

**apparent color.** See COLOR.

**apple green.** A special color, generally applied to Chinese monochrome porcelain, suggesting the color of a green apple.

**applied art.** The term applied art has had many different connotations. It may imply the application to or embellishment of more basic forms. In this sense it is essentially ornament. It may also seek to isolate the more useful object from the more aesthetically significant, and refer to productions of the craftsman rather than to those of the artist. In this sense

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

applied art is analogous to applied science, stressing the practical rather than the theoretical, and is conceived as similar to one of the minor arts. Two other ideas are still current, although datable. One is the usage in many 19th cent. schools where the mechanic arts and the applied arts included all the crafts and trades whose techniques were taught. The other is seen in the contrast often made between applied art and fine art during discussions of machine art; a distinction, in fact, surviving from Renaissance times. In ancient and medieval times craft applied to both types of art. The term "fine" has latterly connoted academic art, or, as Herbert Read has it, "humanistic art", whereas applied art connotes useful art. (See classification of the arts.)

To list the chief categories of applied art is to name the main types of craftsmanship now practised. Those forms which have such a close relationship to painting that dividing lines are blurred include mosaics and murals. Modelling is often indistinguishable from sculpture; interior decoration, from architectural forms, as well as from theatre ensembles. Ceramics, wood, glass, and metal work; textiles, rugs, embroidery, and needlework; leatherwork, illumination, enamel, and jewelry are all included. And in many ways the industrial and the commercial arts should be cited as well. The world of pottery and glass are clearly capable of both fine and applied art design. Textiles, whether from natural or synthetic materials, provide another field for the artist of the applied arts. In fact, each survey of the field of applied art is likely to lead the student to wonder how the artist and the craftsman ever parted company.—W.S.R.

**applied decoration.** The application of decorative ornament to any object, as applying carving to a piece of furniture, or decalcomania designs to a household article. See applied design. Whitford and Winslow in *Dictionary of Education.*

**applied design.** A pattern used to decorate an object as differentiated from the structural planning of the object itself. (Thus a piece of pottery may be embellished by the application of ornament through painting, incising, or modeling.) See applied decoration. Whitford and Winslow in *Dictionary of Education.*

**applied order.** Decorative column and entablature fixed to a wall or pier; non-structural in function.

**applied psychology of music.** See EXPERIMENTAL PSYCHOLOGY OF MUSIC.

**appliqué.** Ornament or ornaments of one material applied to another to form a design or pattern.

**appogiatura.** A grace which is followed by the main note. *Vorschlag* in German, *port de voix* in French. Numerous variations in the execution of the appogiatura are demonstrated in historic treatises on interpretation. —F.D.

**appuie-main.** See mahlstick.

**Apsaras.** *Hindu myth.* A divine water nymph or dancer of the heaven of Indra. See INDIAN ART.

**apse.** Projecting part of a building, esp. a church; semicircular or polygonal recess covered with a half-dome or other vault.

**apsidiole.** Secondary apse where central apses are present in a church; usually found in number as small apse-like projections from the ambulatory and transepts.

**apsis.** See apse.

**aqua fortis.** A method of etching involving use of nitric acid as a mordant.

**aquarelle.** A water color drawing, esp. transparent water color. Printed plates colored with water color using stencils.

**aquatint, an intaglio process** (Lat. *aqua,* water, and *tincta,* dyed). The aquatint graphic process is a method of biting tones instead of lines, thus producing rich, deep, velvety, dark tones as well as delicate transparent tints. The tones resemble water color washes which accounts for the name, aqua, or water, tint.

The process differs from line etching or soft ground in that the ground laid does not protect the plate entirely from the acid. The method usually used for obtaining this porous ground is to raise an asphaltum or resin dust in a confined space, and then allowing it to settle on the surface of the plate. Specially constructed dust boxes are used for this purpose. After the plate is dusted it is placed over a heater which melts the particles of dust until they adhere firmly to the copper plate.

If the grounded plate were placed in the bath without stopping out, the acid would attack the metal between the protecting particles of ground, forming solid tone, the depth of which would depend on the depth of the biting. It follows then, that if one

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

wanted a pure white it must be stopped out before the first immersion in the acid.

The next lightest tone is stopped out and it is put into the acid bath again. Dipping in the acid and stopping out is alternated until all tones on the plate are accommodated. Aquatint, rarely used by itself, is often combined with soft ground, etching, drypoint, pen process, and other intaglio mediums. See PRINTS AND PRINT PROCESSES. —K.K.

**aquatint, colored.** A monochrome print tinted with water colors after printing.

**aquatint, crayon method.** A method of biting aquatint tones wherein stopping out gives the print the character of a drawing with white chalk on a black blackground. —K.K.

**aquatint, crayon method (an intaglio process).** The aquatint crayon method is a variation on the aquatint process. In this method the plate is cleaned and a regular porous aquatint ground is laid on the plate. A drawing is made on the plate with a cheap paraffin wax crayon. Wherever the wax protects the plate from the action of the acid it will leave a white crayon-textured line on the plate. Usually, in actual practice, the pure whites only are drawn before the plate is immersed for a short bite; each subsequent drawing and biting produces a darker crayon-textured line.

The crayon method is sometimes used all by itself to produce an interesting, coarse, white, crayon-textured print; at other times it is used in combination with etching, soft ground, pen process, and other intaglio processes. —K.K.

**aquatint in color.** An aquatint using more than one color, produced in either of two ways: (1) printing from one plate on which all the colored inks have been applied, or (2) multiple plate printing, in which each color is applied to a separate plate. —K.K.

**aquatint mezzotint.** The plate is prepared by biting a solid tone of aquatint. The design is scraped and burnished by using the mezzotint method, the result being a great deal like mezzotint. —K.K.

**aquatint, pen process.** A method of making aquatints that has the quality of a pen or brush line.

**aquatint, three plate color (an intaglio process).** The making of a three plate color aquatint is necessarily very complicated. The greatest care must be taken in timing the exposures to the acid, as the slightest variation will materially change the colors. The problems of registry, shrinking of the damp paper, are considerable also. The most practical color chart developed shows 216 different combinations of the three primary colors: red, yellow and blue.

There are two methods of producing aquatints in color: (1) rubbing different colors on one plate, and (2) preparing a separate plate for each color, thereby producing innumerable additional variations by overlapping different color values on the color plates. The latter is the process described here.

The blue plate is made first, using one or more of the intaglio processes, usually soft ground or pen process. A tiny dent is put at either end of the plate for a register mark. A proof is pulled, dusted with powdered cobalt blue, and an offset is made from this proof to the red plate which has been aquatint grounded. The red plate is now bitten. Using a specially consructed chart, a trial proof is marked, showing how many minutes to bite the red plate at any given spot to produce the desired color.

The yellow plate is the last one to be made. Both the red and blue proofs are dusted with corresponding colors and offset to the aquatint grounded yellow plate. At this stage one should have a record on the yellow plate of all the work that has been done so far on the blue and red plates. Using this specially constructed chart and a marked proof of the blue plate as a guide, the yellow plate is now bitten to varying depths to produce various color combinations.

Tones of aquatint are now added to the blue plate in order to complete the color combinations, and the three plates are ready for printing.

The yellow plate is printed first with cadmium yellow ink. A pin hole is made in the paper at each of the two registry marks. The red plate is now inked with cadmium red, and two pins with sticks for handles are put through the registry pin holes in the back of the yellow proof, the points resting in the register dents of the red plate. The paper is allowed to slide down the pins to register with the red plate. The pins are withdrawn and the plate is printed. A similar procedure is followed for printing the final plate, which is ultra-marine blue. —K.K.

**aqueduct.** Any conduit or channel used for the transmission of water; often supported on masonary arches.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

**arabesque** (from Fr. *arabesque;* synonyms: It., *arabesco, rabesco;* Sp., *arabesco;* Ger., *arabeske* or *laubwerk*). (1) Literally whether used as an adj. or n., *arabesque* means Arabian or in the Arabian manner. In all European languages, the term is understood to mean mural or surface decoration in color or low relief composed of flowing lines and patterns of flowers, leaves, branches and scrollwork fancifully intertwined. The derivation would suggest an actual Arabic origin or influence for all decoration of this sort, which is not the case. The term actually refers to any decorative work of a capricious nature containing arbitrarily intertwined foliage, tendrils and flowers and scrollwork; in addition human figures, birds, beasts, fishes, reptiles, insects, and bits of fantastic edifices may be introduced. This **grottesque** (not *grotesque*) system of decoration was inherited by Renaissance artists, not from the Mohammedans, but from Graeco-Roman work, found in abundance and highest quality in the *thermae* of Titus and on the walls of numerous Pompeiian villas. Raphael (the Vatican *loggie*) and Giulio Romano (Palazzo del Te, Mantua) were notable practitioners of this art. The decorations of medieval illuminated manuscripts are in part properly called arabesques. In modern usage, any fantastic decoration based on flowing lines may be called arabesque, whether or not it contains representations of living animals; Moorish and Arabic work is now usually distinguished as Moorish arabesque, or **mauresque.** —T.A.H.
(2) A position in the classic academic ballet vocabulary, in which the dancer's body is supported on one foot, either straight or half-bent, with the other extended in the air, at right angles to it, the arms arranged to create the longest possible line from fingertips to toes. —L.K.
(3) A brilliant musical piece in rondo form; also a musical embellishment.

**Aralu.** *Bab. myth.* Gloomy abode of the dead.

**Arapaho art.** See Plains Indian art.

**arcade.** A series of arches supported by piers or columns.

**arch.** A semicircular or pointed structural device formed of separate truncated wedge-shaped solids, arranged with their joints at right angles to the curve, to span an opening.

**ARCHAEOLOGY, AESTHETIC ASPECTS OF.** In Greek usage the word *archaiologia* means "knowledge of old things, ancient history" (Josephus; Dionyisus of Halicarnassus). It may mean also "study of early legendary human culture" (Plato, *Hippias Maior,* 285). In modern scholarship the term *archaiologia* was first used by Jacques Spon (1647-85) to describe investigation concerned with the monuments rather than the literary remains of Classical antiquity. In relation to the modern field of archaeology as it has emerged within the last hundred years we may distinguish three definitions of progressively wider scope: (1) archaeology is not an academic discipline but a technique to which recourse is had when other lines of evidence fail to provide solutions for historical problems. (G. Kubler, *Art. Bull.* XXIV, 1942, p. 181). Here archaeology is conceived as a technique which through excavations and exploration detects, describes, restores, and makes accessible new material for historical research of all kinds. The study of art *qua* art is obviously considered outside the province of the archaeology in this definition.

(2) Archaeology is a study of the material remains of the human past which aims to reconstruct the historical environment and the civilization of a given period (D. E. Hogarth, *Authority and Archaeology,* 1899). Though this definition is usually rejected by Classical archaeologists, it represents the actual direction of research in many archaeological disciplines, especially those associated with geology, paleontology, anthropology, and ethnology. The development of human society in relation to its environment is seen as the focal point and art is treated as a social function or as a historical source (an example: W. B. Dinsmoor, in *Studies W. G. Leland,* 1942). Many students of Prehistoric and primitive archaeology feel that art cannot be treated as an autonomous phenomenon in primitive societies and that any aesthetic evaluation represents an illegitimate projection of a modern point of view. Another definition, formulated for medieval archaeology, concedes to archaeologists the privilege of studying all material remains as historical expressions of human activities or ideas, but leaves to art historians the stylistic analysis of art as an aesthetic expression to be judged by specific laws that are universal and timeless. The study of iconography and iconology is a branch of archaeology according to this definition. (G. de Jerphanion, *La voix de monuments,* 1930, Ch.i.).

(3) "Archaeology is a study of history in its material manifestations"; "archaeology of

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

art" is the most distinguished part of this historical field (C. T. Newton, *Essays on Art and Archaeology*, 1850 (1880) and E. Buschor, *Handb. Archaeol.* 1938, Ch. 1). This definition originated in Classical archaeology of the Romantic period. The archaeologist is here conceived as an investigator who starts from the material object in contrast to the philologist who starts from the written source. His proper domain included the study of the style and content of art in antiquity, the Middle Ages and the Renaissance. The increase of excavations and the influence of the natural sciences which dealt impartially with each object made it axiomatic that an ideal archaeologist must be able to interpret in every respect all objects of ancient civilization. The aesthetic interpretation of art is as much part of this encyclopedic task as the scientific interpretation of ancient technology. Theoretically this comprehensive ideal is still defended by many archaeologists. Practically, however, the growing diversity of methods and the increase of material has resulted in greater specialization. There are indications that histories of ancient art, science, material culture, and ancient religions are emerging as independent branches of scholarship, even though all of them employ the same archaeological material.

Aesthetic contributions of archaeology may be classified under three heads: the contribution of new artistic material, that of techniques in preservation, restoration, and description of art, and the contribution of new methods and ideas in dealing with art. If we regard the search for monuments of the past by the amateur and the profiteer as archaeology, Egyptian grave-robbers, Roman soldiers who plundered Greek tombs in Corinth, and treasure-hunters of all times may be classified as archaeologists. But archaeology conceived as a discipline determined by a search for knowledge is a product of the nineteenth century. Only isolated instances of historical conclusions drawn from archaeological evidence are reported from Classical antiquity. (Thucydides, I, 8 and Plutarch. Cf. R. Carpenter, *Humanistic Value of Archaeology*, 1933). The enthusiastic researches of the Renaissance, the Baroque, and the Rococo, while unquestionably determined by a desire for knowledge, did not provide an adequate excavating technique and failed to develop a systematic approach to the aesthetic aspects of ancient art.

Because they widen our horizon of aesthetic experience, archaeological discoveries have exercised an important influence upon our ideas of art. The idea of "Classical" art underwent progressive changes with the discovery of Greek originals, with the separation of Greek art from Etruscan, and with the subsequent periodization of Greek, Etruscan, and Roman art. The growth of archaeology is responsible also for making known the arts of Egypt, Mesopotamia, Mycenae, Crete, and India; as well as the arts of the Prehistoric, Far Eastern, Celto-Germanic, American, Oceanic, and Pacific cultures. These discoveries brought before European artistic circles types of expression hitherto undreamt of. Archaeologists may fail to show sufficient understanding of the artistic aspect of their own finds; artists and art critics may not understand the elements of these arts conditioned by environment, but the new artistic products become living values for our culture and are comprehended with greater depth and intensity when modern taste moves in their direction. (For archaeological discoveries cf. A. Michaelis, *A Century of Archaeological Discoveries*, 1909. P. Gardner, *New Chapters in Greek Art*, 1926. Th. Wiegand, *Handb. Archaeol.* I. 1938, 82 ff. *Antiquity* I, 1927 and following vols.) To investigate the influence of archaeological discoveries upon modern art and modern art criticism is an aim of the history of taste. Here we may recall the close relation of archaeological research and Neo-Classicism, the rise of Prehistoric and medieval archaeology promoted by Romanticism (*Antiquity* 1937, 3i), the influence exercised by the growing knowledge of Oriental and primitive art upon the exoticism in the later nineteenth century. Similarly the appreciation shown to Minoan and Tell-Amarna art by the period of art nouveau and Impressionism, the discovery of archaic, Egyptian, Sumerian, and Negro art by the artists and art critics of post-Impressionism, and the importance of Indian archaeological remains for the modern Mexican school of painting, reveal the stimulus of archaeological discoveries upon modern art. The aesthetic appreciation of the archaeological material shown by artists and art critics has often induced archaeologists to treat the art of their special fields as an artistic phenomenon. And in several fields, for instance in Prehistoric (Scheltema, Menghin, Kuhn), Egyptian (Worringger, Kaschnitz, G. Krahmer, E. B. Smith, D. Curtius, H. Evers vs. H. Schaefer, J. Capart, G. Reisner, A. Scharff, N. Davies, W. S. Smith), Sumerian (R. Fry, vs. H. Frankfort and W. Andrae)—and the art of the American Indian (*Cat. Mus. Modern*

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

*Art*) it is evident that the study of art as a separate discipline emerges from the controversy between "outsiders" (artists, art critics, art historians, anthropologists, psychologists) and archaeologists.

*Techniques.* Classical and Near Eastern archaeology has led the way in developing systematic techniques of excavation, preservation, and description of works of art. The development of scientific techniques of excavation and preservation have made incredible strides since the days of the "scavatori" in the Renaissance, or even since the days of Schliemann (E. Petrie, *Methods and Aims in Archaeology,* 1904. Th. Wiegand. *Hand. Archaeol.* I. 1938. W. F. Albright "So live the Works of Man", *70 Anniversary of E. H. Hewett,* 1939). With the aid of natural sciences the archaeological detectives have celebrated their greatest triumphs in the study of non-literate Prehistoric and primitive cultures. Excavation and preservation, however, have only a subsidiary significance for the aesthetic aspect of art although they make a vital contribution in recording any changes which may distinguish a work of art in its reconstructed form from its original condition.

The methodical description of a work of art is of great aesthetic significance: it was developed to a considerable degree in the archaeological fields. The archaeological description is not a uniform enumeration of surface appearances, but seizes upon the salient features of the object described. The object is thereby placed within a context and given a preliminary position within the system of our knowledge. Furthermore, any description of a work of art must attempt to express intelligibly the "unique" quality of a work of art: the description therefore touches upon the great secret of artistic creation. J. Winckelmann (1717-1768) was the first to insist upon the precedence of the visual impression over the subject matter. He was also the first to lay down a system of description according to formal criteria (beauty of concept or subject; beauty of expression; unity of composition and proportion; beauty of detail [anatomy]). W's method was influenced by the scientific classification of Linnaeus. His descriptions were often unsystematic and contained elements which are usually omitted in modern archaeological descriptions (broad concepts such as beauty and truth; literary anecdotes, antiquarian excursions), but other elements remain valid (aesthetic judgments, aesthetic categories, verbal imagery). Above all, he laid the foundation for the study of art as a rational discipline. The archaeological descriptions were later perfected by G. Zoega, O. Jahn, H. Brunn and many others and influenced the early phases of art history.

*Ideas.* Ideas contributed to aesthetics by archaeology include modern art theory of the Renaissance, the Baroque, and the Rococo (cf. A. Blunt, *Artistic Theory in Italy,* 1940. E. Panofsky, *Idea,* 1924. R. Lee, *Art. Bull.* 1940, 197), but this discussion is confined to the treatment of aesthetic problems in modern archaeology. Winckelmann was the first theorist of Classical archaeology, although important elements of his art theory had been anticipated (e.g. "style" in visual arts as a phenomenon dependent on time and race, by de Caylus, 1692-1765). W. postulated that ancient art should be discussed "in a philosophic spirit and with a well-grounded expression of the truly beautiful". He was first to give a rational chronological sequence of Classical art thus making the study of art an historical discipline. He shared the naturalistic concept of eighteenth century historians (cf. Montesquieu and Gibbon) who regarded the development of art as a cycle of youth, growth, and decay. Superimposed upon this historical system is a Platonic metaphysic system: historically Classic Greek art is the high point of a cycle; philosophically it is the highest revelation of Beauty, Truth, and God, a consummate, eternally valid statement of absolute ideals of humanity. Students of ancient art have spent the last hundred and fifty years challenging and modifying W's view, but the cause, meaning and effect of Classicism still remain the central problems of the study of ancient art. The early nineteenth century elaborated W's theories and modified them in accordance with the increasing knowledge of Greek originals, but no systematic advance was made in the development of stylistic methods. C. T. Newton (*Essays on Art and Archaeology,* 1820-1850) sees "thought" and "noble motif" (iconography) as the essential stylistic qualities. The influence of philology caused archaeologists to consider the interpretation of subject matter as the supreme objective. Literary sources still constituted the historical framework, which was illustrated by works of art. Archaeologists of the Romantic period placed foremost the relationship of art to the individual, to the race, or to the nation. (F. Gerhardt, C. O. Mueller, G. Welcker, O. Jahn, C. T. Newton). Scientific historicism of the mid-nineteenth century shifted toward an Darwinian elaboration of developmental factors (typological method)

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

and chronological sequences, and a new emphasis on the factual data (*Corpus* enterprises) which led to a systematic collection and publication of archaeological objects. Scientific observation of detail was also responsible for the rise of Morelli's comparative method, which seeks to recognize the work of individual artists, regions, and periods by the study of characteristic details. This method inaugurated the emphasis on visual form and helped to clarify the difference between the analysis of visual form and the interpretation of subject matter (Brunn, Furtwängler). The influence of philology weakened, but paleographic investigation of archtypes and copies supplied the method for differentiating Greek originals and Roman copies (Helbig, Furtwängler). The idealistic conception of art with its concomitant value judgment was gradually abandoned in the later nineteenth century in favor of a materialistic interpretation of art forms. They were thought to be determined by exigencies of technique, and by biological, physiological, social, economic, or political factors (Semper, Löwy, Milchhöfer, Kalkman). W. Pater still treats Greek art as an expression of Greek ideals, but its "sensuous form" is conceived as a result of techniques and materials, not of stylistic categories. In a modified form this point of view is accepted by Carpenter. He combines the materialistic interpretation of the development of art with the physiological theory of "empathy" which maintains that the enjoyment of art is conditioned by psycho-physical responses (*The Aesthetic Basis of Greek Sculpture,* 1929). The rebellion against the persistent Classicism of the Winckelmann variety originated with "objective historicists" who desired to reconstruct the meaning of each art for its own period (Carpenter) and from "philosophical historicists" (Riegl) who regarded history of art as a continuum (not as a cycle), in which new types of human experience manifest themselves in novel and different forms, all of equal value.

The appreciation of Roman and late antique art inaugurated by Wickhoff and Riegl presents an example of the new relativism. Riegl's categories of optic and haptic art were still based on physiology (cf. Hildebrandt), while Wickhoff's emphasis on representation of light, space, and movement is grounded in the aesthetic theories of Impressionism. The important distinction between conceptual and visual (optic) art was borrowed from psychology (H. Schäfer, R. Carpenter). The anti-Classical reaction was further strengthened by the discovery of the primitive mind (anthropology, psychology) and by the non-objective ("expressionistic") trend of modern art theory. In Classical archaeology this glorification of the "primitive, strong, mythical, pre-logical" mind has resulted in an intensive study of the archaic, Orientalizing, and Geometric periods of Greek art (E. Buschor, H. Payne), while the idealistic creed of expressionism has produced a positive valuation of the late antique "primitivism" (Kaschnitz, Castelfranco). The new idealism, sharpened by experiences of World War I, is reflected in M. Dvorak's "history of ideas" (*Essay on Early Christian Art*). The general changes of human spirit rather than a specifically artistic "will" (Riegl) account for the changes in artistic expression. The study of cultural types initiated by Burckhardt (cf. also Ruskin, Pater, and the anthropological theories of types and cycles) has also contributed to this approach. The value judgment (absent in Dvorak) re-appears in archaeologists influenced by the "Third Humanism". They claim a special quality for Classical Greek art, not because it is Winckelmann's embodiment of transcendental ideas, but because it formulated for the first time in visual form the ideals of rational humanism fundamental for the European-American tradition. (B. Schweitzer, Dickinson, Rodenwaldt). The non-historical manner of the early 19th cent. Neo-Classicists, who expected to attain an art absolute solely through imitation of its external forms must be abandoned. But the general trend of our time toward fundamentalism indicates that Classical civilization and Classical art may again become symbolic of general human values.

Archaeologists maintained a lead in recognizing problems of artistic form, until the mid-nineteenth century when the leadership passed to historians of art. Ruskin, Semper, Hildebrandt, K. Fiedler, R. Norton, W. Pater, K. Lange, B. Berenson exercised considerable influence upon archaeology. The decisive step in the investigation of independent visual form came about 1900, when the historical growth of forms was shown by Wickhoff, Riegl, and Wölfflin to be capable of methodical analysis. Another group of investigators proceeded from a non-historical systematic treatment of categories of visual art toward an association of these categories with historical forms of art. This movement, too, had its influence upon the study of ancient art (D. Ross, J. Hambidge, A. Pope, cf. L. D. Caskey, *The Geometry of Greek Vases,* and many investigations of proportion, order, and "refinements" in

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

ancient architecture). As a natural reaction against the emphasis on the iconographic and psychological elements these categories were at first confined to formal aspects of art, but later definitions of "form" and "structure" include psychological, emotional, and spiritual determinants as well as visual elements, and recognize the interdependent unity of these various aspects in a work of art. Ancient art has been discussed from this point of view by Kaschnitz, usually with the aim of isolating racial or national types of art, while the followers of Croce (R. Bianchi-Bandinelli, *Critica d'art,* 1935) insisted upon the importance of the creative individual and the unique quality of each work of art.

*The present state of aesthetic problems in the various archaeological fields.* Visual art is an historical phenomenon conditioned by environmental factors; but it is also a self-sufficient expression of human ideas and emotions, comparable to language or music. An ideal investigation of the aesthetic problems of art should recognize the varying relation of these two aspects. Hence the position of aesthetic research in archaeological fields is dependent upon the amount of historical information available. In fields where the historical framework remains to be created or is only vaguely outlined (Prehistoric, South American Indian) the study of art is frequently used for the solution of historical problems of "cultures", races, migrations, trade, diffusion, etc. Even if stylistic criticism is brought to bear, the autonomous values of art are neglected. Conversely, art critics sometimes treat the art of these fields on the basis of modern *l'art-pour-l'art* interpretation of artistic forms, omitting environmental elements which are essential to a complete comprehension. The gap between the historical and aesthetic approach can probably never be closed in the study of the arts of non-literate cultures except on the uncertain ground of parallels drawn from the study of the art of primitives of our time. In cultures whose historical background is known, the two aspects may be synthesized. Such synthesis has been achieved in the study of Greek and Roman art and this approach is being recognized by students of the arts of Egypt and the ancient Near East.

The direction of the study of art within the framework of the different archaeologies is in part dependent upon the completeness of material. Thus many of the Prehistoric and primitive archaeologies and, in a measure, the archaeology of early Egypt, early Near East, and Asia are in a stage in which collection of new data is of decisive importance, whereas in Classical, late antique, medieval, and Byzantine archaeology revolutionary discoveries are less frequent and the problems of synthesis are of paramount importance. In Classical archaeology many smaller problems of chronology and grouping remain to be solved, especially in Minoan, Geometric, Hellenistic, Roman art and in the arts of borderlands exposed to Classical culture. But the major problems are those of "research in depth", the closer analysis of visual and formal vocabulary (e.g. M. Bunim, *Perspective Ancient and Medieval,* 1940), correlation of the visual arts within various periods, relation of form and content, systematic analysis of quality, relation of individual, school, and period, and the interpretation of visual art in relation to the culture of the different periods (T. B. L. Webster, *Greek Literature and Art,* 1936. L. Curtis, *Griech. Kunst,* 1938, E. Buschor). The views of ancient writers on art must be re-interpreted (Panofsky, *Idea,* 1924, B. Schweitzer, *Xenokrates,* 1932. E. Pernice, *Handb. Archaeol.* I, 1938, 239 ff.) not as sources for factual information or as foundations for absolute aesthetic systems, but as valuable clues to the artistic aims of a period whose meaning can be clarified by comparison with the visual remains of their time. The value of Classical art for our cultural tradition (*Jour. Warburg Inst.*) and for our own time must be presented under the wide perspective of the creation of human values in the historical development of man (F. Taylor, *Pennsylvania Centennial,* 1941).

In Egyptian archaeology, an integrated interpretation of art is a recent development. H. Schäfer has elucidated some of the specifically Egyptian forms and concepts and his work has been continued and elaborated (G. Scharff, H. Frankfort, W. S. Smith, *Hist. of Egypt. Painting and Sculpture in the Old Kingdom*). Appraisals of the entire Egyptian art by "outsiders" (Curtius, Worringer, Evers, Krahmer, Kaschnitz, E. B. Smith) have lacked the authoritative knowledge of the historical background. Better understanding of stylistic criticism, continued investigation of specifically Egyptian forms, and a closer integration of historical factors (psychology, ideas) with aesthetic criticism will present great opportunities for the future historians of Egyptian art.

In Near Eastern archaeology, too, art has been interpreted historically rather than aesthetically, but much work in stylistic correlation has been done (Christian, Woolley,

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

Moortgat, H. Frankfort). The more formal type of stylistic interpretation has been employed by V. Mueller. W. Andrae has interpreted Near Eastern art as a symbolic art oriented toward the essence of existence, providing an impressive synthesis of historical and aesthetic elements. The premises of this theory may be challenged, but it will certainly form the basis for future discussion (*Handb. Archaeol.* I, 1938, 747 ff.). The additions of new artistic material in this field have been more extensive and important than in other ancient fields and much work remains to be done on the organization and interpretation of art on all levels of aesthetic criticism.

In early Prehistoric archaeology, the origin of art in its relation to the development of early man is a problem intimately connected with the fundamental investigation into the nature of artistic creation. There results a close connection with psychological studies of artistic activity (comparison with the art of children and modern primitives). Social and economic interpretation of art as well as racial theories have also figured prominently in modern interpretation of Prehistoric art (Menghin, *Weltgeschichte der Steinzeit,* H. Read, *Art and Society,* 1936, with references). —G.M.A.H.

**Archaic Greek.** Greek sculpture from its beginning in the 6th cent. B.C. up to about 480 B.C., termed archaic, is characterized by certain conventions which were due partly to the sculptors' technical inexperience, partly to the influence of work from Asia Minor and Egypt, and partly to their own predilections. Unable to portray the human form realistically, novices in the mastery of their limited number of tools, they showed nevertheless a keen delight in elements of formal design, and fresh and buoyant vitality in their pioneer experiments in representing human and animal forms. In the Naxian Sphinx at Delphi (c. 550 B.C.) an Oriental type was invested with nervous vitality and decorative neatness typical of the Greek mentality. The frieze on the Siphnian Treasury at Delphi (525 B.C.) introduced popular Greek themes: the assembly of the gods, wars of gods against giants, battles around Troy, and represented them in scenes of vigorous action and clearly-defined patterns. The pediments of the temple of Aphaia at Aegina at the close of this period were organized on a basis of the human figure assuming sharp geometric designs, yet naturalistically enough so that there is no lack of vitality. It is this combination of human bodies rendered with increasing naturalism, yet still held firmly in the grip of formal design, which characterizes archaic Greek sculpture. The best examples in free sculpture are the votive statues of youths (*kouroi*) and girls (*korai*), reminiscent of Egyptian sculpture in their rigidity of pose, standing without any twist of the body to disturb the perfect median symmetry, with the youths' torso muscles geometrically patterned quite as definitely as the maidens' zig-zag bordered Ionic garments, yet winsome in their variety of facial expression and human charm. See HELLENIC ART. —W.R.A.

**archaistic Greek.** Following the overpowering variety of sensuous, realistic, and dramatic sculpture done by able technicians in Hellenistic times, there came a reaction in favor of the simplicity and formal design of the archaic work of 6th cent. Greece. In consequence Graeco-Roman sculptors attempted to imitate the archaic types, producing figures simple in pose, with severely stylized faces and drapery. The resemblance is only superficial; the drapery is mechanically similar, but is hard and dry, lacking the subtlety of finish which the early Greek sculptors lovingly worked out with their emery stone; the faces likewise are monotonously regular, without the fresh bloom of the prototypes. They are also betrayed by certain technical details unattained in the earlier work, notably the sophisticated cutting of the eyes and the corners of the mouth. The result must be described as arid antiquarianism. —W.R.A.

**archisynagogos.** See synagogues.

**architectural control.** See CIVIC PLANNING.

**architectural design.** The disposition of the elements of a building or structure in accordance with the principles of architecture, particularly with reference to beauty of form, proportion, and function. —O.M.S.

**architectural drawing.** The delineation or representation by lines of architectural forms.

**architectural education.** See NEW ATTITUDES FOR THE FUTURE OF ARCHITECTURE.

**architectural form.** Term first employed by the critic R. H. Wilenski to describe the sense of formal order and unity desirable in painting and sculpture. Similar to such essentially synonymous terms as 'plastic orchestra-

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

tion', 'significant form', and 'plastic form', used by Cheney, Bell, Barnes and others to describe the expressive values inherent in well-ordered and original design in painting or sculpture, most clearly illustrated by analogy with architecture or music, where, because of the nature of the media, ideological connotations of forms must be minimized. See R. H. Wilenski, *The Modern Movement in Art*, 1935. —L.D.L.

**architectural ornamentation.** The adornment or embellishment of a structure with the aim of enhancing its appearance.

**architectural rendering.** An architectural rendering, strictly defined, refers to the general representation of a building as a designer envisions it and as he wishes it to appear to a spectator. Contrasted with the carefully ruled and measured plans and elevations which serve as practical guides for engineers and contractors, a rendering presents a building as a product of design, and employs all of the devices of painting, drawing, and perspective which appeal to the artistic sense. Various media have been employed, but the most popular are those which combine subtle or dramatic effects of chiaroscuro with minute detail. For the former effect, charcoal, watercolor, and various crayons are serviceable; for the latter, pencil, pen, and etching needle are popular for their accuracy. Defined freely, architectural rendering would include the work of artists, archaeologists, and scholars, as well as designers, who have made notable representations of buildings which have dramatized the architectural art. Among them would certainly be included the work of Piranesi, Meryon, Turner, Canaletto, and Whistler in past times, and, more recently, the work of Eliel Saarinen, Frank Lloyd Wright, Hugh Ferris, John Taylor Arms, Bertram Goodhue, and Kenneth Conant. Without sacrificing accuracy, each of these has fostered the prime requisite of an architectural rendering — namely, that it emphasizes the beauty and impressiveness of a building as distinct from its utility and durability. —P.C.B.

**architectural sculpture.** In the greatest periods of architecture and sculpture the two arts have worked in intimate association with each other, sculpture indicating the social purpose of buildings, helping to suggest functional relationships, and enriching the surface; architecture giving its sister art increased dignity and power by virtue of the alliance. Such cooperation is natural, for both arts use similar materials and organize them into three-dimensional designs. To be successful, however, it demands the closest sympathy, understanding and collaboration between architect and sculptor; and, like architecture, the sculpture must adapt itself to the demands of physical surroundings, function, and aesthetic construction.

This was achieved in Egypt, in the low reliefs at Sakkara and Abydos, and the incised reliefs of the Empire at Luxor and Karnak; with a fine sense of scale, effective filling of space, crisp contours and rhythmic grace, the sculptors decorated the walls of the mastabas and temples with scenes of the everyday life about them. Assyrian sculptors used severe geometric stylization, befitting the austere and smooth-walled buildings. Mayan sculptors also employed a geometric type of carving. In the Persian palace at Persepolis the rhythms were more flexible and gracious; and the sculptors of the Cambodian temples in Indo-China covered their walls and towers with a riotous melange of figures in the most intricate compositions, but in very low relief which enriches rather than detracts from the monumental mass of the temples. Never has the relationship been more fruitful than in 5th cent. B.C. Greece; there architecture and sculpture united in achieving harmonious composition, logical arrangement of space, and coordinating rhythm. Later, in the Hellenistic period, the sculptors demanded too great attention for their work, which, dealing with melodramatic themes, protruded in high relief from the buildings. This error was avoided in Romanesque churches and early Gothic cathedrals, in which the relief was kept low and well adapted to the surface of the buildings; in later Gothic buildings, when the architectural surface became broken up into strong lights and shadows, the sculpture became increasingly assertive, sometimes detracting from the structural mass. Renaissance and later European sculptural decoration followed for the most part the Hellenic or Hellenistic tradition. In modern times a new type of building for a machine age emphasizes structural asceticism and stripped surfaces, with ornament reduced to a minimum. Architectural sculpture has therefore been relegated chiefly to churches which are adaptations of Romanesque, Gothic or classical types, or public buildings which follow classical patterns. But some sculptors are now beginning to work hand in hand with architects of the new order, creating sculpture in incised or low relief, sometimes geometric in style, more often of the human figure slightly stylized as in the archaic Greek and

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

Gothic, which harmonizes with geometric modern buildings. Among such sculptors have been Bourdelle and the Martel brothers in France, Franz Metzner in Austria, Ivan Mestrovic in Yugoslavia, Josef Wackerle and Hans Panzer in Germany, Eric Gill and Jacob Epstein in England, and Lee Lawrie, Alfonzo Iannelli, Rene Chambellan and Gaston Lachaise in America. An outstanding example of the collaboration of modern architects and sculptors may be seen in the State Capitol at Lincoln, Nebraska. —W.R.A.

**architectural stage.** See MODERN STAGE-SETTING.

ARCHITECTURE (L., *architecture,* the act of building; Gr., *archi,* chief and *tecton,* artificer—hence, a masterwork). From the derivation of the term it is evident that the ancient conception of architecture was a kind of super-craftsmanship, and indeed until the close of the Middle Ages, it may be considered as an adaptation of materials to use, partly through the operation of tradition and partly through the gradual expansion of structural processes. The invariable accompaniment of ornamental embellishment was symbolic, commemorative or dialectic in character and formed an inseparable complement to the structural masses.

Throughout this long period all styles revolved about the fundamental problem of covering a unit of space. Two universal methods prevail: (a) the **trabeated system,** or post and lintel construction, embracing the ancient Egyptian, Minoan, Persian, Greek and recurring in the reinforced concrete, truss and steel skeleton construction of our day; (b) the **arcuated system,** including the derivatives of the arch, e.g., the various types of vault and dome construction which constitute the dominant units of the Roman, Byzantine, Romanesque and Gothic styles.

Initially the choice of one or the other of these methods was a consequence of the presence or absence of stone.In Egypt, Crete and Greece the trabeated system was adopted without compromise. In Mesopotamia, where stone was scarce, it was necessary to evolve a method of spanning voids by combining small units of perishable sun-dried brick into arches and barrel vaults. The Egyptians, while conversant with both methods, specifically isolated them according to use or material. Secular architecture was arcuated in brick; religious and mortuary architecture with negligible exceptions was executed in stone and trabeated.

The Greeks also were familiar with both systems, but definitely rejected the arch and vault in favor of the static majesty and simplicity of the column and lintel.

To the Romans is due the discovery of the structural possibilities in increased spans of the arcuated system when executed in concrete. In their hands, spans of 60 feet were attained by the intersection of barrel vaults and of 140 feet by the use of the dome. Nevertheless, inasmuch as these were executed in concrete, once the material had set the structure became static or monolithic, that is, the loads were vertical and vaults ultimately constituted little more than vast lintels in vaulted form.

It remained for the Middle Ages, first in the dome on pendentives of the Byzantine builders, so nobly exemplified in the Church of Hagia Sophia and eight centuries later in the balanced skeleton construction of the Gothic Cathedrals, to demonstrate the extraordinary possibilities of the arcuated system.

A second broad classification may be made, less noticed than the first but of far-reaching consequences, i.e., a differentiation based upon the manner of assembling walls. In this again, there are two types under which practically all styles may be grouped.

In countries where stone was abundant, such as Egypt, Greece, Syria and France, we find the wall built throughout of one material which is left in evidence both on the outside and inside of the structure, q.v., the Cathedrals, the Greek Temples. This may be broadly classified as **ashlar architecture.**

In countries such as Mesopotamia and Persia where the sun-dried brick which formed the heart of the wall was too perishable to leave exposed, it was customary to protect it by a coating of ceramic tile, or within, by decorative slabs of carved alabaster. In like manner, the Romans and Italians throughout their history habitually covered their walls of brick or concrete with slabs of varicolored marble or limestone or sheathed them in hard plaster (stucco duro). This is what is known as **veneered** or **revetted architecture.**

The Renaissance is, as its name signifies, usually considered as a rebirth of Classic forms. It had its origin in Italy and from there radiated throughout Europe. The French Renaissance is usually considered as a derivative of the Italian which superficially is the case. A profound difference, however, resulting from the foregoing distinction in materials, underlies the two, a difference which has powerfully affected our interpretive methods.

The **revetted system,** so obvious in the

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

Italian architecture, led to a differentiation in idea as well as in material, of the wall surface from its substance; and inferentially, a like distinction between the outer and inner faces and their functional relation. To the Italian, the wall was intended to mask the spatial areas behind it. In France, on the contrary, where limestone construction prevailed, the content of the wall was one with its surfaces and inferentially, the wall was integrated with the contained areas. Out of this habitual association evolved the basic theory of the French Renaissance, that of articulation of plan with function and its scrupulous expression in facade. The contemporary so-called "International" style (q.v.) introduces a third interpretation which leans rather to the Italian conception than it does to the French, but offers an interesting variant to both in this respect that it omits the wall as a mass and preserves the veneer. The building becomes fluid space within a skeleton of verticals of steel or concrete sustaining the slabs of the floors and roof and the walls become merely a protective shell around the whole.

In addition to these structural concepts, architecture embodies many elements, forces and traditions in which climate, materials, social and economic conditions, as well as geographic and ethnological influences play their part.

For the past four centuries its freedom has been hampered by the intrusion of a variety of doctrinal forms and dogmatic adherence to types. The revolutionary tendencies of our day are to be interpreted partly as a revulsion against the constriction of established types, partly as the effort to find a contemporary interpretation consistent with the technological character of modern life. It is to be regarded as in a state of fermentation from which a new and vital expression may be anticipated. In this, the inclusion of mass housing and the correlation of architecture to city and regional planning is to be noted. —L.H.

**architrave.** The lintel or horizontal beam, lowest member of the entablature in the classic orders; a horizontal beam resting across two upright columns.

**archivolt.** An ornamental moulding following the outer curve of the voussoirs or wedge-shaped blocks forming an arch.

**archlute, archilute.** See MUSICAL INSTRUMENTS.

**arcosolium.** Cell in a Roman catacomb; arched.

**arcuated.** Curved like a bow. See ARCHITECTURE.

**Ares** (L., *Mars*). The Greek and Roman god of war, not a very popular figure in either classical literature or art. The most famous statues of him represent him clad in armor and usually seated in a nonchalant pose, as on the Parthenon frieze and in the Ludovisi Ares. In postclassical sculpture he has been represented by Guillaume Coustou II, Canova, Thorvaldsen and Dannecker. Iannelli's Mars on the Adler Planetarium, Chicago, realizes better than most of these the sterner quality of the god of war. —W.R.A.

**argent.** *Her.* Silver.

**Argentine tango.** See tango.

**argillite carvings.** See CANADA, ART OF.

**Argos, school of.** Famous for its athletic tradition and canon of masculine proportions was the Argive School of Greek sculpture. The earliest examples are the 6th cent. B.C. twin kouroi at Delphi, signed by Polymedes (or Agamedes); these figures are of robust youths stiffly standing in a symmetrically frontal position. The greatest Argive sculptor was Polyclitus (fl. 450-420 B.C.), whose bronze statues of athletes were made according to his system of ideal proportions known as the Canon. Judged by Roman copies of his Doryphorus, this was a stocky, squarely-built type, measuring approximately the same in length of lower leg, thigh, and from the navel to the ear, and with a head about one-seventh of the total height. Although his figures were freely poised in an attitude suggesting movement, his modeling was rather austere and emphasized the formal character of the human body. In statues of youths he softened the planes of the body and the expression of the face, and worked out a lovely pattern of tousled hair. These figures inspired many later sculptors, among them the artist of the well-known Idolino in Florence. Polyclitus also made the ivory and gold cult statue of Hera for her temple near Argos. Argive sculpture in the 4th cent. B.C. followed the Polyclitan tradition, but introduced greater variety and charm; notable among products of the school were statues of boys scraping themselves, of which a bronze from Ephesus is probably a copy. —W.R.A.

**aria, aria da capa, aria parlante.** See OPERA.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

**Ariadne.** The Cretan princess who made it possible for Theseus to slay the Minotaur and escape from the Labyrinth. On his way back to Athens he deserted her on the island of Naxos, where she was comforted by Dionysus. This scene is best known in art by the paintings of Titian and Tintoretto, representing Dionysus blithely coming to console her. —W.R.A.

**arioso.** (1) Short aria. (2) A portion of melody ending a recitative (see OPERA). (3) A cantabile in instrumental music.

**Aristion, stele of.** A stele in the National Museum, Athens, dating about 510 B.C. It represents a warrior standing in profile. Archaic in rigid pose and patterned detail, it has the crispness and clarity of design characteristic of its period. Traces of the original color remain: red on the background and blue on the cuirass. —W.R.A.

**Aristotelian form.** See form: a philosophical analysis.

**Arita yaki** (Jap.). Ceramic ware made in Hizen province.

**armarium.** See ambry.

**armature.** A skeleton or framework upon which sculpture may be modeled; in small works it is usually made of stiff wire; for heavy pieces iron pipe, wire mesh, etc., are used. —R.M.

**Armenian dragon-carpets.** See ISLAMIC ART.

**armes parlantes.** See HERALDRY.

**armorial bearings.** See HERALDRY.

**armorial-pictorial.** See ex libris.

**Armory Show.** See POST-REVOLUTIONARY PAINTING AND SCULPTURE IN THE U.S.A.

**army drum.** See MUSICAL INSTRUMENTS.

**aron hakodesch.** See synagogues.

**around the corner room.** See MESOPOTAMIAN ART.

**arpeggio.** *Mus.* A broken chord, in harp style.

**Arretine ceramics.** A distinctive creation of Roman potters, Arretine ware was made of fine red clay and decorated with designs in low relief stamped on the outside and covered with red glaze. For this purpose molds were used in which the design had been cut. The shapes of the bowls were graceful, and the designs of delicate figures were nicely spaced. See CERAMICS II. —W.R.A.

**arriccio** (It.). The rough first coat of plastering in fresco painting.

**arris.** The sharp ridge formed by the meeting of two surfaces, as the edge between two flutes of a Doric shaft.

**ars antiqua.** See MEDIEVAL MUSIC.

**ars mensurabilis.** See MEDIEVAL MUSIC.

**ars nova.** See MEDIEVAL MUSIC.

**art.** (1) "Art" designates any activity that is at once spontaneous and controlled. In this general sense of the term, Art is distinguished from and contrasted with the processes of nature: Art is any intelligent method by which nature is controlled. The history of art, in this abstract sense of 'Art' would be the history of human ingenuity and contrivance; it would cover the range of human enterprise, in handicrafts and architecture, industry and medicine, government and law, religion and education. Art is controlled ingenuity that is aware of its objective. An art may be merely accidental in its inception; as was the Chinamen's discovery of how to roast pig. Yet unless a fortuitous event arouses interest in us, so that the conditions of its repetition are sought out and understood in practise, any such happening remains no more than a fortuitous event. An art arises whenever the conditions of a process are understood and made stable by practise.

(2) In aesthetics and in social theory, a distinction is usually drawn between the fine and the useful arts. The fine arts serve no ulterior purpose: their products are valued in and for themselves. The useful arts serve an ulterior purpose lying beyond those artefacts themselves. The artefacts of the fine arts are end-values, those of the useful arts are means to ends. A painting in egg-tempera is valued in and for itself: a sable hair brush is valued as a means to the end of a painting in egg-tempera. The useful or servile arts comprise all forms of instrumental manufacture, ranging from the relatively simple handicrafts to the highest complex technologies and techniques of modern industry. Many artefacts of the useful arts such as shipbuilding, are at once valuable as means to ulterior ends, and

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

delightful in and by themselves. And many artefacts of the fine arts are at once beautiful, or valued in and for themselves, and also useful; as is, for example, a Greek vase.

(3) There is no Art *as such*. There are only arts *such as* the fine art of painting, the useful art of rug-weaving, the fine art of music, the useful art of engineering. The connotation of the term art in any case of its use will derive from a description of the spontaneous and controlled activities the term Art is then used to designate. That description will describe the respects in which the art in question is spontaneous in energy and controlled in practise. Like any other abstract noun or adjective (such as "spontaneous" or "controlled") : "Art as such" is a term verbal whose connotation derives from its context. See classification of the arts. —R.W.C.

**art activities, school.** Activities of a creative or appreciational sort dealing with art expression, carried on with or without teacher direction, and intended to afford emotional release and to offer training in the use and appreciation of art mediums. Whitford and Winslow in *Dictionary of Education.*

**art administration.** Management of the art education program in a school or community educational system. Whitford and Winslow in *Dictionary of Education.*

**art appreciation.** The effort to perceive vividly the content and quality of works of fine art, and to evaluate these works comparatively or in terms of an abstract standard.—D.W.G.

**art as expression, as imagination, as imitation, as language.** See AESTHETICS.

**art commission.** See CIVIC PLANNING.

**art criticism.** This term is used in a number of senses, some of which overlap and some of which are quite distinct from one another. A few of the more common or important senses are here explained:

(1) The commonest, and for many the fundamental, meaning of "art criticism" is a judgment of the aesthetic value of a work of art in accordance with some standard or criterion of aesthetic value or in accordance with some method of reaching an aesthetic evaluation. There are as many types of art criticism in this sense as there are proposed standards of aesthetic criticism or methods of aesthetic evaluation. These range from practical standards of technique in schools of art practice, through conceptions of what constitutes the classics in an art, or conceptions of what constitute the high points or touchstones of aesthetic achievement, to standards philosophically supported or argued for on either *a priori* or empirical grounds. At the one extreme is the art-school teacher or master artist who is in possession of a set of rules of technique developed out of his personal experience or inherited from his own teachers, which he assumes without much reflection are well grounded because of the experience behind them. At the other extreme is the philosopher intent upon the definition and validation of aesthetic criteria, giving careful consideration to the grounds for accepting criteria of criticism but often lacking in the experience to give these detailed application. It is one of the problems of aesthetics to assay these proposed aesthetic criteria, and to attempt to distinguish those which are justifiable from those which are not. A history of aesthetics is essentially the narrative of this undertaking for as long as men have been interested in this problem.

(2) In another sense, art criticism is equated with the personal expression of a writer's appreciation or reaction to a work of art, supposedly without any standards of judgment. This is often called **impressionistic** or **expressionistic criticism.** It amounts to a complete skepticism regarding the possibility of establishing justifiable standards of criticism and it regards itself as frank and disillusioned in recognizing that writings about works of art are simply the statements of impressions and are not authoritative in any sense at all.

(3) In a third sense, art criticism is sometimes equated with the historical study of works of art especially where stress is laid upon their social significance in the culture of an epoch. In criticism of this sort the emphasis is upon scholarship and insight into distinctive traits of style and into art trends.

(4) A fourth sense of art criticism, overlapping some of the previous ones, identifies it with a study of the character and total work of individual artists. This permits of a wide range of approach from a methodical psychological or psychoanalytical study of the artist to an intuitive grasp and reconstruction of his personality. There may or may not be some suggestion of an ethical or aesthetic criterion for judging the greatness of a personality.

(5) In a fifth sense, art criticism is occasionally identified with expertizing. The aim here is to reach a judgment of the genuineness of a work of art, or, if the work has a complex authorship, or has been tampered with

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

in various ways, to unravel what happened to it and describe in detail how it reached its present state.

In the history of criticism there has been some rather unrewarding debate as to whether certain of these meanings were not the "real" meaning of the word. There seems to be no profitable way of controlling usage. What one can control, however, is the clarity of one's own distinctions in one's own uses of a word. Though the term, "art criticism" is ambiguous, a careful writer can employ the various senses of "art criticism" without ever being ambiguous, and can reserve his efforts to examining the degree of achievement under each one of these uses of the term. —S.C.P.

**ART EDUCATION** has two fundamental aspects, namely, subject matter and educative processes. Traditionally, its subject matter would be the so-called arts of design, painting, drawing, architecture and sculpture; its educative process would be described as academic.

Modern art education has a much larger meaning. In its broadest sense, considering the first aspect, it is that area of education in which all achievements in the visual arts made by man in the past and all opportunities for continued art activity and cultural development through it at the present are so related for presentation and study as to provide students at all ages in school and out with a basic understanding of the place of art in modern life and with an experimental basis for individual expression and understanding in all media. In this statement the visual arts likewise are given the widest meaning. They include not only the traditional subjects, as has been noted, painting, drawing, architecture and sculpture, but as well crafts, decorative arts, and all the materials of nature and industry which can be utilized for individual or collective art expression.

The main aims, therefore, of art education, thus conceived are these:

(1) To give each individual a basis for making art judgments in the selection of clothing, practical everyday articles for his home, in planting and arranging a garden, etc.

(2) To develop a citizen who can share both the responsibilities and satisfactions involved in fine community and city planning, (public buildings, parks, highways, etc.) and who would understand that vital art is profoundly social.

(3) To make it possible for a layman to be sensitive and able to evaluate various works of art, historic and contemporary, to have an interest in critical discussion about these and, in general, to look upon the whole realm of visual arts as a source of unending curiosity, a stimulation for study, larger understanding and enjoyment. Such a person would be in a position to have an open-mindedness toward the arts of all peoples, as Chinese art of today or the art of the primitive peoples of Africa.

(4) To discover and develop artists, those who have been endowed with deep feeling and imaginative minds so that they can create new things in two or three dimensional forms, depending upon the availability of materials in terms of functions or use and expression of individual feeling.

(5) To develop teachers in the visual arts who would be creative in some medium and who would be motivated in guidance and instruction by a philosophy of this larger conception of art education.

Art education as an educative process has been generally characterized by two practices. One of these may be described as academic. Variously used as "academic" has been, historically it covered, first, the training of artists alone and, second, it was a well defined, most often dogmatic, method of instruction. Moreover, academic art education was, and in the main still is, interested in two dimensional work, painting and drawing; sculpture, three dimensional, was of course included. The result of this was "studio art" and academies of art. Most of this was in the professional field.

Over one hundred years ago, with the rise of public schools, however, academic art education was introduced into the curriculum of these. Here again the emphasis as a method of instruction was placed on routine exercises, imitation, representation and technical proficiency or skills. It was aimed at the gifted student rather than all students. Academic art teachers made and make such instruction a communication of knowledge, hard-and-fast principles and information rather than a problem of guidance for individual growth. The result was and still is wherever the practice obtains, stereotyped, dull and unimaginative art.

Technical proficiency, the skill "to draw accurately" to execute work according to "established formulas," was regarded as a great virtue, not only in America but throughout the western world, especially where industrialism had developed. Even in 1944 many art schools, chiefly commercial art schools, and many art teachers in public schools, stress and insist upon this.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

Another development of the philosophy and practice of academic art education was the art historian, who, especially previous to the present generation, most often held that the way to understand and enjoy art was mainly, if not solely, through scholarship and literary criticism. Academicians and historians of this sort worshipped the Old Masters and not infrequently despised contemporary developments or dismissed them as inconsequential.

A second educative process in art education is perhaps best designated as "Progressive Art Education." This is a 20th century development in the main, having for its pioneers, the modern artists in the professional field and like Cizek of Vienna and Dow of New York in public and private schools. The emphasis here is that art education, as the late Dean Melvin S. Haggerty most aptly phrased it, is "a way of life," meaning by that, all experiences which are involved in the transformation and perception of materials and media should be enjoyed and understood as a part of total living and not esoteric experiences which make for "art for art's sake."

Viewed as an educative process, then, progressive art education holds, first, that art experiences and expression are normal to and needed by all individuals; second, that the whole visual and contactual world, the materials of nature and products of industry, is its subject matter, not only canvas and colors paper and crayons, stone or wood and tools, etc.; and third, it is the growth of the individual with respect to his needs and the appropriate use of available materials that is vitally important, not the accuracy of representational drawings, nor great skill in techniques. Here too, the teacher guides the student rather than imparts information. The educational philosophy is to achieve the integrated development of the whole personality and, as a result, to make possible the realization of the educational aims stated above.

Another aspect of art education today is the development of a program of experimental research. Instead of accepting without question traditional practices and methods, art educators today have begun and completed many experimental studies in instructional procedures and in the psychology of art expression. Notable work has been done by individual Germans and Austrians and in the Bauhaus School of Europe previous to the Second World War and in America by such men as John Dewey, Thomas Munro, Melvin S. Haggerty, Ray Faulkner and others in the Owatonna Art Project, Norman C. Meier, Lydia B. Powell, Betty Lark Horovitz and many others. A large body of information has been gathered, the utilization of which has made possible more effective teaching. There is yet much to be done in this field.

Art education, as a 20th century concept, is concerned with the entire world of visual arts and has as its chief aim the development of all individuals who will not only understand, create in or enjoy the arts but who also will understand that expression in these media is the expression of insights and sensitivities of others to the world in which they live.

—C.M.

**Artemis** (L., *Diana*). The sister of Apollo, virgin huntress and protector of maidens and matrons, moon goddess. Her attributes were the bow, deer, hound, and crescent moon. In art she has usually been represented as a sturdy, athletic young woman engaged in the hunt; as such she appears in Greek and Roman sculpture, and later sculptors, including Goujon, Houdon, Falguière, St. Gaudens, Anna Huntington, Milles and Manship followed this tradition. Correggio and Boucher painted pictures of her. —W.R.A.

**artemisia.** See SYMBOLISM IN FAR EASTERN ART.

**arterial street, highway, etc.** See CIVIC PLANNING.

**art exhibition.** A display of two- or three-dimensional art products, or of reproductions of them, whether in the form of a showcase display, a wall display, or a demonstration. Syn. *art exhibit.* Whitford and Winslow in *Dictionary of Education.*

**art expression.** Emotional release through art; the result of one's feelings and thoughts made manifest in a work of art. Whitford and Winslow in *Dictionary of Education.*

**art, fine and industrial.** A designation used for the organization of the study of art in public elementary and secondary schools, according to which both pure and applied arts are studied from the point of view of common elements; may include the study of painting, sculpture, arcitecture, commercial art, industrial design, and other phases. Whitford and Winslow in *Dictionary of Education.*

**art for art's sake.** Art executed primarily to appeal to aesthetic sensibilities, through exploitation of material, form, and expression, for their own sakes. Contrasts with *art for*

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

*propaganda* (q.v.). The term may be applied to all art whose first purpose is to give aesthetic pleasure rather than to persuade to some conviction or course of action.

While in practice most works of historic art have combined the two purposes in a single aim, or at least have accomplished both objectives without conflict, such artists as Whistler, Inness, Cezanne, Picasso, Maillol, and Marin, and the art of the first third of the 20th cent. in general as contrasted with the art of Egypt or the Middle Ages, may be said to represent rather the doctrine of "art for art's sake" than "art for propaganda". Similarly, modern critics of the formal aspects of art, like Clive Bell, Roger Fry, Walter Pater, R. H. Wilenski, and Sheldon Cheney, contrast with such 18th and 19th cent. ideological writers as Diderot, Tolstoy, and Ruskin on this issue. —L.D.L.

**art for goods.** See SCANDINAVIAN ART.

**art form.** (1) An expression of art, such as a picture, a statue, a poem, or a play; (2) a technique of art expression; thus etching and blank verse are both *art forms;* (3) the entire formation of a work of art, including consideration of design, medium, and construction. See form. Whitford and Winslow in *Dictionary of Education.*

**art for propaganda.** Ideological art, executed primarily to persuade the spectator in favor of a literary idea, a philosophical opinion a religious conviction, a political, social or economic doctrine, or any specific or general course of action. The term is not applied unless the aesthetic merit of the work was, in the mind of the artist, clearly a secondary consideration as contrasted with the propaganda value. Contrasts with 'art for art's sake' (q.v.), but most works of art throughout history have been neither clearly 'art for art's sake' nor 'art for propaganda'. The strongest contrasts exist today in the aesthetic approach of the French artists from the impressionists to the present on the one hand, and the ideological prejudices of the nationally controlled arts of Nazi Germany on the other.—L.D.L.

**art guidance.** (1) Provision for educational and vocational experience through observation of and participation in various phases of art; (2) direction of student interest into art, or into active participation in art activities. Whitford and Winslow in *Dictionary of Education.*

**art history.** See history of art.

**articulation.** *Mus.* Devices of composition aiming at clarity of design; purposeful arrangement of musical elements according to the functions which they have to fulfill in the context, esp. with a view to properly balancing their metrical weights; phrase construction. —E.K.

**art impulse.** The urge to create or to appreciate art. Whitford and Winslow in *Dictionary of Education.*

**art industry.** An industry in which materials are transformed with the end in view of producing an art product; as for example: textiles, costumes jewelry, silverware, furniture, ceramics, printing. Whitford and Winslow in *Dictionary of Education.*

**art interpretation.** A specialized study of art objects with a view to developing habits of good taste and critical judgment in artistic matters. Whitford and Winslow in *Dictionary of Education.*

**artisan.** A person skilled in the techniques of an art or mechanical pursuit, but whose work does not demand creation, invention, or originality; dist. f. *artist.* (Thus, the sculptor, who makes a model for a statue in clay, is an *artist;* the stonecutter, who reproduces the clay model in marble, is an *artisan.*) Whitford and Winslow in *Dictionary of Education.*

**artist.** A person skilled in the practice of an art in which creative activity is dependent upon aesthetic judgment, imagination, and originality. (Different types of artists are architects, sculptors, painters, draftsmen, interior decorators, cartoonists, designers, and commercial artists.) Whitford and Winslow in *Dictionary of Education.*

**artistic ability, art ability.** Special aptitude or native talent and developed skill in the creative arts, as applied to drawing, painting, design, modeling, and other forms of art expression. See art tests. Whitford and Winslow in *Dictionary of Education.*

**artistic ability of children.** See CHILDREN'S ART.

**artistic form.** See form: a philosophical analysis.

**artistic inspiration.** See inspiration.

**artistic myth.** See myth.

**artistic stimulation.** See inspiration.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

ARTIST, PSYCHOLOGY OF THE. In accord with all other human psychological phenomena, art represents an interaction of the person with an object (or other person). In most human behavior two aspects can be distinguished, a locomotion and a method of locomotion. It is his attention to the latter aspect which seems to distinguish the artist from the non-artist. In more commonly used terms, the artist is expressive and sets a satisfying mode of expression as his goal—no matter what other goals may move him.

By the classification the *psychology of the artist,* we mean that the artist, rather than the art object, forms the focus of our analysis. It would be futile to assume that by this emphasis we can remove from consideration the art object, or for that matter, any other factors in the situation. To avoid sterility, analysis must proceed from and never be far removed from the interactional setting from which it has been abstracted. Thus, the understanding of the psychology of the artist is furthered by a consideration of the significance of his artistic behavior—the art products—in his life history. Mursell expresses this view when he says, "The art of music is a creation of the mind of man. All its characteristics and organizing principles depend upon the action of the mind. All its effects upon us when we listen to it, all that we do when we perform it or create it, are determined by the laws of the mind.

All persons exhibit artistic behavior at some time, i.e., partake in interactions in which the locomotion is an end in itself. However, the term artist is used to describe individuals who habitually exhibit artistic behavior because it forms a persistent part of their life histories. A doorman may derive pleasure from opening a door with especial flourish and rhythm or an executive may delight in signing his name with graceful flowing strokes, but these are not the usual referents of the word artist. In social psychological and sociological terms, the word artist refers to specific sets of interactions involving specific types of objects and motives. Though the point of demarcation may be blurred, such behaviors as those involving music, theatre, various manipulations of visual stimuli, e.g., painting, sculpture, and language are referred to as artistic. Individuals who habitually participate in these behaviors to produce art objects are called artists. The behavior of these individuals is not dependent upon a different set of principles than the artistic behavior of non-artists. Indeed, each may contribute to a better understanding of the other.

This, then, is our focus in the psychology of the artist. We are concerned with the artist and his life history as distinguished from other individuals. Also, we are concerned with determining the degree to which his present behavior patterns, other than the formal artistic ones, differ from those of other individuals. Though we are not concerned with applying some standard of value to his art products, we are concerned with comparing his interactions with art objects to those of non-artists. In other words, we attempt to determine whether the artist can be distinguished from the non-artist in any other terms than the fact that he habitually produces some type of art object. Our emphasis is upon what the artist does which includes what he says he does. Earlier in this field of inquiry, research has been largely confined to studies of autobiographies. This is certainly an important source of data, but the direct observation and analysis of the artist's behavior should not be neglected. In recent years the latter methods have received more attention.

In analyzing his behavior, the various roles of the artist should be considered. First and foremost, the artist is a member of a social group or one might say a member of a number of social groups. His special social group is the one defined by the artistic culture. The nature of this social group, its instituted ways of behaving are a rich source of data for both social psychologist and sociologist. In this connection would be included studies to determine the degree to which the "artistic personality" is defined by artistic group instituted behaviors and the degree to which these behaviors are idiosyncratic. Other similar problems for investigation would be a comparison of the degrees of idiosyncracy in the behavior of artists and non-artists, in the behavior of artists of one medium and another. Of great interest is the question of how the goals of the artist are influenced by his interactions with the other members of the artistic social group.

The artist plays roles in other cultural subgroups which are contained in our society. He has attitudes toward social and political questions. He has ways of approaching the group problems. Analysis of the artist is concerned with describing his modes of action in these social contexts. It concerns the questions of whether his solutions to social problems are different from non-artists; whether his modes of attack are different. It is also concerned with the way in which the goals related

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

to these social interactions are reflected in his goals as an artist. In essence, the problem has two statements: 1. Can the artist be recognized in his larger social context? 2. Can the larger social context be recognized in the artist?

Obviously, the most important single role of the artist is that of a creator. This is his most specific role in that it is most quickly recognized. However, it is also a role which is not easily analyzed. For example, take the process of creation. Much of the behavior involved is implicit and therefore not easily accessible to the outside observer. At the same time, the demands of the creative process leave little opportunity for self-analysis. What self-analysis and observation there is comes as a reconstruction of the process after the fact. As such it is subject to the influence of social or personal stereotypes, meaning that the artist may report what he *thinks an* artist does rather than what he recalls that *he* did. Such a report is a valuable datum, but is not an evidence of what the artist did in the creative process. Other types of evidence that are available are preliminary sketches of final paintings, rough drafts of preliminary manuscripts of musical works and the like. As interim stations in the progress toward the final object, these data are of value only in so far as they lead to reconstruction of the creative behavior pattern.

Through observation it is possible to follow the work habits of the artist to gain some understanding of the specific stimulations to creative activity. There is a considerable body of dogma as to how the artist works. Some are inclined to believe that, once engulfed in the creative process, the artist must work until released. But others will claim that the artist operates in much the same fashion as any other worker of his level of complexity, following a fairly fixed routine. Observation can reveal the degree to which any description as to work habits can be generalized for artists exclusively.

Of special interest to the personnel psychologist is the question of what physiological functions and behavioral experiences make the artist able to perform his particular type of creative activities. It seems certain that a color blind individual will not become a painter, but what mechanical and motor skills must he possess; what verbal intellectual skills? Will experiences that develop certain ways of viewing his environment and certain ways of expressing his reactions exert a greater influence than organic and physiological characteristics? These are the questions the personnel psychologist must answer to be of aid to the individual trying to come to a decision about a professional career. The acceptance of his work will be the final criterion for the professional artist, but it is expensive to delay one's occupational decision that long.

Closely linked with his role as a creator is the artist's role as an appreciator. Creation and appreciation can be viewed as Siamese twin processes, organically related but not congruent. As a creator, the artist is interacting with other objects to produce an expression of a feeling. In appreciation, he is interacting with an expression of a feeling. In so far as he recognizes and accepts the expressions contained in the artistic work, he reacts favorably to the art object.

There is much to be gained in studying the artist as an appreciator. From a study of the sensitivity of his reactions, it is possible to gain greater insight into his reactions as a creator. In studying the sensitivity of artists one would attempt to test many of the common claims of artists. For example, it is common for painters and sculptors to assert that they can tell the difference between original creative works and reproductive paintings of these works or between original oils and collotype reproductions, even when the factor of difference in reflective surfaces is ruled out. Musicians claim to be able to discriminate the playing of one symphony orchestra from another, the interpretations of one conductor from another, or the playing of one virtuoso from another. That some of these discriminations can be made is an undoubted fact. Whether all of them can be made is a topic for experimental inquiry. In such experiments it would be valuable to study differences in sensitivities of artists as related to their particular phases of operation in their media. For example, how would the commercial artist compare with the so-called fine artist, the purely instrumental musician with the composer, the poet with the novelist, etc. Comparisons of the sensitivities of artists and non-artists would also be in order.

In studying the artist as an appreciator, we are interested in the aspects of the art object to which he reacts. One kind of evidence on this question would be to ask a group of artists after having viewed a painting for the first time, to then retire to their studios and attempt to reproduce the painting. One can assume that those aspects of the painting that do not appear in the reproduction are aspects which had little effect upon the artist's re-

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

actions to the painting. From his handling of the subject it would be possible to develop ideas as to his modes of reaction in the creative processes. In one case in the writer's experience, this was done with art students. The results, which showed that one part of the group approached the reproduction in a highly enumerative way, that others emphasized certain relations to the exclusion of details and that still others made their reproductions into expanded close-ups of the most striking part of the original, were all very revealing to the instructor.

Another phase of observation of the artist as an appreciator is the gathering of evidence of the feelings and meanings derived from his interaction with the art objects. Presumably creation and appreciation are emotional experiences. The appreciative behavior of artists and non-artists can be analyzed to find some indices of the emotional reactions. Through mechanical devices it is possible to record physiological changes that might be linked to emotional reactions, but the use of such devices may introduce so much artificiality into the observations that their value would be destroyed.

It is somewhat easier to study the meanings of art objects for artists. Various art media are used to convey meanings to people. Advertising and propaganda are very dependent upon the assumption that certain types of expression convey meanings common to large numbers of people. In Russia, musicians are censured when their works reflect "bourgeois or counter-revolutionary sentiments." Two questions may be stated: 1. What does the artist's production mean to other artists? 2. What does the artist's production mean to non-artists? It is obvious that the different media can be distinguished in the degree to which they express ideas and to which they are purely expressive of feelings.

In summary, our discussion has delineated the areas of interest within the artist-object interactional matrix which are a part of the *psychology of the artist.* We have pointed out that the *psychology of the artist* is concerned with the artist in relation to his social contexts. It is concerned with describing the ways in which the artist can be differentiated from his fellow artists and from non-artists. Also, it is concerned with describing the ways in which the artist is like his fellow artists and like non-artists. See *Art in American Life and Education,* Fortieth Yearbook of the National Society for the Study of Education, 1941; Hevner, K., "Aesthetics", Chap. XXI in *Fields of Psychology,* J. P. Guilford, ed., 1940; Meier, N. C., *Art in Human Affairs,* New York, 1942; Mursell, J. L., *The Psychology of Music,* 1937. —E.S.B.

**artist workman.** See artisan.

**art motivation.** (1) The incentive or vitalizing drive that leads to art activity; (2) the stimulation of other school activity through contact with art experiences. Whitford and Winslow in *Dictionary of Education.*

**art museum, school.** A place set aside for the preservation and display of works of art for the purpose of appreciative recreation and education. Whitford and Winslow in *Dictionary of Education.*

**art nouveau.** Name given to a new style in art flourishing between 1890 and 1905, in France, Belgium, Germany, Austria, and sporadically in England, Spain, Holland, Italy and the U.S.A. The name is accidental, coming from the fact that the art dealer, S. Bing, who carried examples of the work, called his gallery, "Art Nouveau" (opened 1895-96). The style was variously named: in France, "modern style," "Style—1900," (E. de Goncourt called it "Yachting style"), in Germany "Jugendstil" (q.v.) (from the contemporary magazine, *Jugend*), in Italy, "Stile Liberty" (from the English store of that name carrying textiles, jewelry and small decorative arts). In Belgium, the art is associated with a group called *Les XXs,* later *La Libre Esthetique,* in Vienna with the *Sezessionists.* It found its expression in architecture, sculpture, painting, the graphic arts, furniture, wall paper, stained glass, textiles, glass, silver and other metals, ceramics, and jewelry. Its leaders aimed to break with old traditions and to create a new style. Their watchwords were spontaneity, naturalism, simplicity, good craftsmanship. Specifically they urged the use of new materials, cement, iron, steel, and glass, and frank expression in construction. One of its leaders, Henry van de Velde (Belgian) said "we need a logical structure of products, uncompromising logic in the use of materials, proud and frank exhibition of working processes." That forms like those of Art Nouveau evolved out of such aims as these is due to several factors. In spite of voices like van de Velde's there was during these years a general confusion and lack of confidence in the face of the machine. Furthermore, Japanese art was a compelling force (see Japonism). Again, both social and political factors, contributed their influence.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

The style appeared fully fledged with the architecture of the Belgian Victor Horta in 1893, and had from its first appearance outstanding and unique characteristics in the contours of its forms, its line, and decorative details. It turned to nature, in her gentlest aspects, and sought inspiration from a definite and restricted group of natural forms: forms immature, but growing, whose functional structure was now familiar to the eye through microscopic analysis and micro-photography, (hence appear a host of foetuses in the graphic arts, and shapes that suggest cross sections of seeds and flowers in the decorative arts); and forms distinguished for grace, delicacy, and tenuous charm: trees like the elm; vines; unfurling fronds; sea weed and lily pads; flowers such as roses and lilies, heavy tulips, waving and bending on their stems; spiraling shells, sleek fish (and sirens); insects with frail wings and long antennae; sparrow hawks, goldfinches, doves, and peacocks with long sweeping tails. Stimulated by this range of material the art forms evolved were sinuous and flexible. The line, used decoratively on flat surfaces, and in the designing of metal balustrades and screens, was long, free-flowing, and supple, ending in a characteristic flick, well termed "whip lash". Supplementing the long line was a wealth of detail: shorter swirls (called in Germany *schnörkels,* or flourishes) suggesting the waving antennae of insects, flower stamens, filaments swept by the wind or the sea; or clusters of naturalistically rendered flowers, fruit, leaves, and tendrils, tiny birds and insects. Special effects in surface design, (on walls, or screens) in the work of Horta and Whistler, are very reminiscent of Japanese art in their assymmetrical balance. The wealth of detail seems to grow naturally out of the structural points where it is concentrated, while long flexible lines lead the eye to wide open areas. Assymmetrical balance is not universal, however, as some artists prefer to balance the whip lash line symmetrically, making flower-like or spread-eagle cartouches and panels. Contours in architecture and furniture were curvilinear, in some cases tense and wiry, in others as svelt as the outline of a lily, or the contour of a pear. In fact, individual artists show a wide range of variation in their handling of these basic components. Horta's work, best seen in the stairway of his Brussels house at 12 Rue de Turin (Pevsner, figs. 23, 24) is luxurious and leisurely to the point of languor, while the decoration of the German August Endell (Atelier Elvira, Munich, Pevsner, fig. 64) is defiant in its boldness and energy. While some artists, like the German J. M. Olbrich, use a wealth of ornament, men like van de Velde eliminate all naturalistic detail and work with austere simplicity. Aubrey Beardsley and Leon Bakst evolve in their graphic art an intricacy and fineness of detail and technique in sharp contrast to the large, tranquil forms of the German Otto Eckmann in the same field. Leon Bakst's work is quite different in its brilliant color from the favorite Art Nouveau color schemes, which are pale, dull, misty and muddy: greys, mauves, blues, sea-greens, and dusty yellows.

Art Nouveau found its expression in various art forms. A study of its buildings, exteriors and interiors alike, reveals originality and definite predilections in the treatment of planes, line, doors, windows, and interior space. Planes of facades have often one or several double curves, and projecting balconies; roof lines slope with a slight S-curve. There is a preference for domes, dome-shaped and vaulted rooms. Entrance doors and windows are curvate, without frames or pediments, sometimes with hood-like projections over them. Endell's architecture, however, in spite of his extravagant ornament, is as straight and severe as the modern International style. Guimard, J. M. Olbrich and Otto Wagner use exuberant detail, the typical Art Nouveau line and clusters of ornament, on the exteriors of their Metropolitan Railways (Paris and Vienna) while Horta, van de Velde and the Spaniard A. Gaudi use little interior ornament confining it to the metal balustrades at window. German architects liked color, introduced by glazed tiles. The Rookwood pottery in the U.S.A. turned out architectural tiles for fireplaces and walls in soft pastel shades; flowers, vines and birds predominate. (It is interesting that they had a Japanese potter on their staff.) Rooms, whether or not domed or vaulted, often have curvate walls. Ornament here is sometimes theatrical in its extravagance (Peter Behrens). Some of the finest creations of the style are found in the nervously delicate iron balustrades (Edgar Brandt, Horta). At their worst these interiors give an unpleasant sense of over-weaning effort and their wavering contours are unstable in effect. This can not be said of the securely controlled work of Renet Binet's interior for the Magasins du Printemps in Paris where the sweeping lines of the style sing with breathtaking confidence and grace. One of the real contributions of the style to architecture is its sense of the flexibility of the new materials.

Sculpture, painting, and the graphic arts bring up the matter of representation, choice of subject matter, and its interpretation. The visual components, and modes of composition remain the same. Subject matter tends toward obscure symbolism, allegory, myth, legend, and emotional or psychic experiences that have to do with man in the modern world: loneliness in, and fear of the city (E. Munch) religious doubt, etc. Either these matters or a rather dreamy, vacuous, decorative treatment of subject matter at hand, as in the work of John Alexander, Aman-Jean and others. The most original figure, in the field of sculpture, is the German Max Klinger. He used various colored stones, combined with white marble and bronze, encrusted with jewels, metal and ivory. No complex symbolism or remote expression was too obscure for him to undertake. His figure of Beethoven is a superb example of the style in the medium of sculpture. The portrait of Princess Baratinsky by the Russian Troubetzkoi is a good example of the style at its dullest, as is the work of Falguiére and the figurines of A. Léonard. There is an abundance of architectural sculpture in relief, tombs, monuments, drinking fountains, and garden pieces (Constantin Meunier, Hermann Obrist, et al). On the whole American sculptors were busy assimilating earlier European styles. Daniel Chester French comes the nearest to Art Nouveau in his Melvin Memorial in Concord, Massachusetts.

In painting there is much work that tends to be ingenuous, unsophisticated and naive: paintings filled with women in flowing, peferably white, styleless robes, characterized by idealistic faces and yearning gestures, like a child's image of his mother, or having a slight tinge of the "belle dame sans merci"; male figures, when they appear, are knights in armor, with their dream-filled eyes on far places. Outstanding figures are Burne-Jones in his mosaic the *Tree of Life* in Rome, Ferdinand Hodler and Jan Toorop (Dutch), Fernand Khnoopf (Flemish), Von Giovanni Segantini (Italian), Franz Stuck, Max Klinger, Edvard Munch (German), Gustav Glimt (Austrian), Aman-Jean, Besnard, Menard (French), Frank Brangwyn, James Shannon (English), Blashfield, John Alexander, Abbot Thayer, Edwin Abbey, Whistler (American), José Maria Sert (Spanish).

There is an abundance of material in the graphic arts and the art of the book: bindings, illustrations, posters, and in the format of title pages, frontispieces, theatre programs, and sheet music covers. A host of art journals, and other magazines sprang up championing the new trends and their pages are filled with excellent examples of Art Nouveau: *Pan, Jugend, Simplicissimus, Deutsche Kunst und Dekoration, Dekorative Kunst* (Germany), *The Studio, The Yellow Book* (England), *Art et Décoration, L'Art Décoratif, Revue des Arts Décoratifs* (France), *Ver Sacrum* (Vienna Sezession), to mention a few. Masters of book illustration, William Morris, Eckmann, Klimt, Aubrey Beardsley, Max Klinger, and Walter Crane, tend to frame their pages with borders of swaying flowers or figures. The illustrations themselves are flat, distinguished for their linear grace. (Max Klinger is the exception here. He was a devotee of Goya, and introduces depth and modelling with a fine stippling technique.) When color is used it is laid on in flat areas, or drawings are tinted as with Walter Crane. The illustrations of Howard Pyle and Charles Dana Gibson, and the work of the Roycroft Press should be mentioned to represent briefly the U.S.A. In posters Cheret, E. Grasset and the Austrian, Mucha, distinguished themselves. With printing types there is a good deal of experiment and confusion. The best efforts show the influence of Morris's Golden Type (while the influence of his Gothic is not so good). Goudy had begun his work, but the main text of most publications was set up in Bodoni type and its like.

Art Nouveau furniture and decorative arts were presented to the public on the Continent in a continuous series of exhibitions from about 1892 forward, and its mannerisms are observable in the work of Follot, Dufresne, Brandt, and Ruhlmann as late as the Paris Exhibition of 1925. (Its peculiar linear characteristics are not the only ones observable in furniture. As early as 1898, however, there is a marked tendency towards straight line in the work of Adolf Loos in Austria, and of Charles Mackintosh in England.) The work grows out of arts and crafts movements (q.v.) appearing all over Europe, influenced often by the English Arts and Crafts Societies, and the missionary zeal of William Morris. The Vienna Sezession was such a movement and there was a similar German group. Looking into a fine Art Nouveau room, designed by Colonna, Guimard, Plumet, de Feure, or van de Velde one is impressed by the subdued color, with perhaps an iridescent glow from some piece of opaque glass, and by a certain nervous tautness in the lines of the furniture. But looking into a room of one of the extravagant interpreters of the style like Gail-

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

lard, one is apprehensive. The furniture, like great winged bats, or swollen-jointed grasshoppers, looks as though it might come alive; the chandelier of metal might fly about the room, the glass bowl moulded like a pair of mating doves might dart about, the cricket crawling up the pottery bowl, hop off. The idea of function seems to have been interpreted to mean: able to move, and everything looks capable of that. Some pieces among the decorative arts are moulded to *suggest* animate forms: pottery vases like folded petals (Gruby, Cowan, U.S.A.); glass like lilies (Tiffany), while others exactly imitate them; doves in glass (Lalique); butterflies in jewelry (Lalique). There is a marked preference for texture and moulded surfaces: Wallpaper, like velvet and leather, is embossed; pottery has thick, opaque, runny glazes (Delaherbe, is an outstanding figure in this field); glass has a frosty surface; stained glass is thick, and full of gummy, mixed colors; textiles are embroidered, couched, or if flat, are dyed or block-printed to take on heavy atmospheric effects (sun-set, sunrise, and aquarium iridescences). Notable in the field of textiles and wallpapers are Morris, Felix Aubert, Obrist and Voysey. The best work (Gallé in glass, Delaherbe in pottery, Obrist in textiles, E. Robert in iron) will rarely be excelled.

Last, but not least, it is to be observed that the contour of women's figures from tip to toe was moulded on Art Nouveau lines: hair swept up in pompadours like the calyxes of open flowers; hats were laden with flowers, preferably full blown roses, or with darting birds or sweeping ostrich plumes; "leg-of-mutton" sleeves have the typical line; the waist tapered and the contour of the long skirt was like a lily. Witness the Gibson girl, and the portraits, of Sert, Lavery, Boldini, Sargent, Helleu, Howard Chandler Christy, Alexander and others. Details of costume, Lalique and "Arts and Crafts" jewelry, Liberty silks, chiffon scarfs and veils were, of course, concrete products of the style.

In all of its manifestations and in spite of its brief duration Art Nouveau stands as a distinct style. The time has not yet come for its final evaluation. Its development, sensed by some critics today as a Romantic throwback, is too closely woven with the development of the modern movement to so dismiss it. Some of the leaders of the architectural style developed as creative leaders of modern architecture (Obrich and others) yet its forms are too naturalistic and its attitude too ingenuous for us to feel at home with it. Adolescent, defiant, and naive it yet has tinges of fatigue and exhaustion which defy the objective analysis we, so near the scene of its nascence, endeavor to give it. See Andre Michel, *Histoïre de L'Art,* vol. VIII, parts 2 and 3, Paris,1929, under direction of Leon Deshairs; *L'Art des Origines a Nos Jours,* vol. II, Paris, 1933; Anton Springer, *Kunstgeschichte,* vol. V., Leipzig, 1925; Nikolaus Pevsner, *Pioneers of the Modern Movement,* 1936; Platz, *Die Baukunst der Neuesten Zeit,* Berlin, 1930; Le Corbusier, *L'Art Decoratif d'Aujourd'hui,* Paris, 1925; Ernst Michalski, Article on the Jugendstil in *Repertorium für Kunstwissenschaft,* vol. 46, 1925. —M.F.M.

**art of the iron brush.** See CHINESE ARTS.

**art principles.** See design principles.

**art program, fused.** See art program, integrated (2).

**art program, integrated.** (1) A school art program in which art functions as an integral part of the total curriculum, thereby contributing its share to the integration of pupil personality; (2) a program in which several areas of the fine arts are fused together or integrated for purposes of study; for example, music, literature, painting, sculpture, and architecture may be studied together, without regard for subject matter boundaries, stressing basic principles, forms, or types of expression common to all. Syn. *fused art program.* Whitford and Winslow in *Dictionary of Education.*

**Arts and Crafts movement.** Refers to the movements in England and America which followed, perhaps superficially, the ideas inherent in the Pre-Raphaelite movement and William Morris' doctrines in the latter part of the last century. Many of the fundamental ideas of Rossetti and Burne-Jones as well as the dicta of Morris found expression only in the 20th cent., while the efforts of the leaders of the Arts and Crafts movement resulted in the embellishment of the "house beautiful." A late phase of this same cult guided the early efforts of city planners who argued that the "city beautiful" and garden cities were ends to be sought. In both cases good was doubtless accomplished, but the dangerous dichotomy of art and life was not avoided. It has latterly been acknowledyed that beauty is not something to be added to the practical, and that city planning is intimately concerned with the sociological needs of the whole man and his wise use of land.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

The Arts and Crafts movement gathered force about 1875. By 1888 the Arts and Crafts Exhibition Society held its first exhibition in London. In a land where neo-medievalism was flourishing, where the sound craftsmanship principles of pre-Raphaelite and Ruskin and Morris were widely current, and where the appalling dangers of the industrial revolution were most apparent such a movement had brighter prospects of success than on the continent; America was likewise a more fertile field than the Far East. The movement urgently stressed the simplification, humanization, beautification of everything with which one was surrounded. The personality of the craftsman was emphasized, as was frequently the idea that the material, the technique and the purpose of the object must find expression in the design.

The Arts and Crafts movement is a transitional movement. Through it, the powerful forces which since the 1840's had been active in combating the industrial revolution as a way of life were transmitted to the next century, though the movement itself petered out in America in "mission" furniture and the activities of the amateur. One has only to recall the work in architecture and interior decoration of the Pugins and of Norman Shaw, of Webb, Butterfield, and G. E. Street, or the healthy insistence of the pre-Raphaelites on the importance of color and soundness of technique in design to be reminded of the worthy beginnings of the movement. When Morris' workshop undertook in inlays and textiles, in printing and furniture designing, to preach the lessons of simplicity and truth to function, the movement gained survival value. Ruskin's intoxicating prose, Rossetti's and Morris' hypnotic poetry, and in a burst of activity the superficiality of amateur disciples, were not enough to destroy it. Pattern was rediscovered by Lewis Day, pottery was recreated by William de Morgan, jewelry, gold and silversmithy, enamels, book-binding, and needle-work were all revitalized as the century closed.

One has only to glance through such an historical review as Pevsner's to see clearly the continuing influence of this movement in the 20th cent. Through it William Morris contacts the world of Walter Gropius. C. F. Annesley Voysey in his wallpapers and glass and furniture, Walter Crane and Frank Brangwyn in the arts of design, are all seen waking from the medieval dream and eager to relate art to life once more. Ernest Gimson at the turn of the century was already designing furniture which was honestly and simply traditional, yet modern in feeling, while Ambrose Heal caught the spirit of modernism in his inlay and designs marked by a limited use of curves. Even in the work of Charles R. Mackintosh, despite his enthusiasm for the decorative formulas of Art Nouveau, one senses the modern feeling in space relations, use of materials, attention to function, notably in his Glasgow Art School, 1898-1899. And it is in this period that garden cities began to become practical as greenbelt cities.

In America, the feeling of the amateur and of the superimposition of ornament was never entirely absent from "arts and crafts" products. The scope of the interest is indicated in the files of *The Craftsman,* which ran its course from 1901-1916; "an illustrated monthly magazine in the interest of better art, better work, and a better and more reasonable way of living." The first World War shifted the emphasis and this phase of American design had chiefly historical interest when the post-war prosperity arrived. It was rather the Armory Show of 1913, Alfred Stieglitz and his studio at "291" Fifth Avenue, and the Museum of Modern Art, New York City, which has latterly provided the ideology for the minor arts, checked by the practical American sense and feeling for the mechanics of the problem. Even the Decorative Arts Exposition in Paris in 1925 did not wholly change the course. The fundamentals of design and soundness of craftsmanship preached by Morris and expressed now and again by the Arts and Crafts enthusiasts, the frankly accepted machine, and a growing social awareness are being integrated with notable results, in a world of Machine Art, but prophetic of a world of Human Art. See CIVIC PLANNING; GREAT BRITAIN, ARCHITECTURE OF; also for Morris and his influence, cf. L. F. Day, *Of William Morris and his work,* 1939, and N. Pevsner, *Pioneers of the Modern Movement,* 1937. For more general discussions of the place of the minor arts in modern life, cf. S. Giedion, *Time, Space, and Architecture,* 1941; W. C. Behrendt, *Modern Building,* 1937; R. Faulkner, E. Ziegfeld, and G. Hill, *Art Today,* 1941; S. and M. Cheney, *Art and the Machine,* 1936. —W.S.R.

**art song.** See song.

**art supplies.** The materials employed in the visual and space arts that go into the product and are used up in the process of transformation of materials; for example, pastels, paper,

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

canvas, clay, paints, etc. Whitford and Winslow in *Dictionary of Education.*

**art talent.** Innate aptitude for creative expression through such mediums as drawing, painting, designing, modeling, or any other form of artistic expression; ability to appreciate works of art and to produce art forms. Whitford and Winslow in *Dictionary of Education.*

**art tests.** (1) General art tests have centered upon **aesthetic judgment** as the most significant single factor in aptitude. It is measured by responses to sets of pictorial materials prepared in from two to five variations, one being regarded as superior in aesthetic quality. The subject either chooses one of two or ranks four or five in order of merit as judged. The criterion is either survival (recognized as good over period of time, as masterpieces) or statistically established by consensus of competent judges, or by a combination of both. The two best known tests are the *McAdory Art Test* (1929) and the *Meier Art Judgment Test* (1929). The former makes use of miscellaneous subject-matter (rug-design, textiles, furniture), while the latter uses graphic material only (paintings, etchings). These tests are also regarded as tests of appreciation. (2) *Tests of psychological capacities and skills* feature such items as memory for color and form, simple design facility, and simple imagination. The subject is shown a jumbled pattern of color strips and then by turning the page is required to select from a larger array of colors only the ones just seen; or having viewed for five seconds a complex assembly of objects to identify it on the next page whereon appear five similar assemblies all slightly different. Exercises are also required touching upon rhythm problems and simple design. The assumption is implied that such capacities are expected in the artist. The *Varnum Selective Art Aptitude Test* (1940) is the single example of the type. (3) *Tests of learning and elementary skills.* These, represented by the *Lewerenz Test of Fundamental Abilities* (1927) and the *Knauber Art Test* (1932) attempt to measure the results of learning and elementary imagination, as in the drawing of simple expression of concepts, such as Santa Claus or "the homeless dog." Featured in both are problems concerned with the detection of common errors in drawing relative to proportion, perspective, light and shade. The tests include art terms and art information (art history), tested by the multiple-choice method. The *Lewerenz* test is adapted primarily to the junior and high school level; the *Knauber,* senior high school and junior college level. (4) The *scale,* the best known being the *Kline-Carey,* is a device for assigning a numerical value to a given product of specified nature. It is hence confined to given subject-matter, such as a drawing of a boy running, a house, or the little red school-house. The scale itself consists of a long sheet on which appear drawings from crude examples to progressively better and better ones, with a numerical value under each. The child's product is hence evaluated by matching it with the example on the scale most like it. (5) Tests of *creative imagination.* Elementary aspects of imagination are touched upon in several tests (*Varnum, Knauber*) but for complex creative imagination and perceptual capacity no tests are yet published but on the basis of research now completed the forthcoming *Meier Art Tests: II Creative Imagination and III Perceptual Facility* are designed toward that end. The traits are measured by problems taken through progressive stages of interpretation, by variations of multiple choice methods with differential weighing of responses; and by leading the subject through progressive stages in perceptual identification, with the degree of adequacy of response assigned at each stage. —N.C.M.

**art unit.** An art experience or series of experiences having unity through being organized around some theme, activity, or concept. Whitford and Winslow in *Dictionary of Education.*

**Arundel marbles.** The collection of ancient Greek sculptures and inscriptions collected by Thomas Howard, 2d Earl of Arundel, in the 17th cent., presented to the Ashmolean Museum, Oxford University; includes the Parian Chronicle, an inscription recording events in Greek history. —L.T.S.

**Ashanti art.** See AFRICAN NEGRO ART.

**Ash can school.** See AMERICAN NEGRO ART; POST-REVOLUTIONARY PAINTING AND SCULPTURE IN THE U.S.A.

**ashide-e** (Jap.). A design which combines written characters with other motives.

**Ashikaga art.** See JAPANESE ART.

**ashlar.** (1) Term applied to masonry in which the stones are dressed, hewn, or squared to permit laying with uniformly thick horizontal

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

joints of one-half inch or less. (2) Dressed stone as distinguished from natural, roughly tooled, or rubble. —J.M.M.

**asphaltum.** The chief use in the arts of this tarry compound has been as a painter's pigment. Its general utility has been known from ancient times and it had a good deal to do with the Egyptian processes of mummification. There is little sign of it, however, as a painting material until the late Renaissance, and it was probably most used in the 18th cent. The color is neutral brown and, since the material itself, a natural mixture of hydrocarbons with other elements, is a kind of liquid, it dissolves to some extent in the oil medium. As a glazing material, it was much favored for this reason and because of its warm, neutral tone. As an oil paint, however, it never becomes thoroughly dry and is always subject to further softening from heat. It tends to crawl and flow like tar in a heavy film and has undoubtedly been the cause of much of the breaking and crackling found in dark passages of oil paintings since the 17th cent. —G.L.S.

**Assyrian art.** See MESOPOTAMIAN ART.

**Astarte.** In Phoenician religion, goddess of sexual love and fertility; western Semitic form of the goddess Ishtar.

**asterisk.** An object shaped like a star.

**astragal** (Gr. *astragalos,* ankle bone). A small moulding of single convex curve in the form of a half circle; in classical architecture usually ornamented with the bead and reel pattern.

**astrakhan.** A grade of karakul lambskins, less lustrous, with longer hair and more open curl than the best grade of karakul which are termed Persian lambskins. Astrakhan also applied to imitations of the natural "fur" in fabric for coatings. —G.W.R.

**Asturian architecture.** See SPAIN, ART OF.

**asymmetry.** Asymmetry in art does not mean simply want of symmetry and is not, therefore, the negating antonym of symmetry. It means that a symmetrical arrangement is avoided for certain artistic reasons. To the artist, for instance, who supposes that perfection or harmony is an unknown value, to be achieved only by infinite permutations, symmetrical order is of no sense, because symmetry starts from the belief that perfection is the known value of a central ideal, standing before or above all particular things. Each artist therefore, who expresses himself asymmetrically considers his work as a part or a kind of segment of movement, the center of which lies beyond all particular things in infinity. In doing so he faces the highly interesting problem of balance without conspicuous equilibrium, since balance is the main attribute of every work of art. He may accomplish this by placing the axis on one side of the work so that the whole picture pivots upon that axis. The sowing of figures upon the canvas, as for instance in the picture by Peter Brueghel, *The Blind Leading The Blind,* may be another solution of asymmetrical arrangement. The northern artists tried to solve this problem in many different ways. It is one of the most interesting of historical problems. —A.J.S.

**atelier.** A studio; a workshop.

**Aten.** *Egypt. relig.* The solar disk.

**at gaze.** See HERALDRY.

**Athena** (L. *Minerva*). Goddess of administrative sagacity, including warfare as well as statesmanship, and of women's arts, especially weaving. She was patron goddess of Athens. Her attributes were the owl, the aegis, the olive, and a suit of armor. She was often pictured on Greek vases, fighting the giants or sponsoring Theseus, the favorite hero of Athens; in sculpture she was usually represented as a warrior. The most famous statue of her was Phidias' great chryselephantine figure in the Parthenon. Phidias' Lemnian Athena was of a more gracious type. Roman Minervas were colder in character. In later European and American sculpture she was pictured by Cellini, Sansovino, Permoser, Thorvaldsen, and Roy Sheldon. —W.R.A.

**Athletic school.** See POST-REVOLUTIONARY PAINTING AND SCULPTURE IN THE U.S.A.

**atlante.** Male of caryatid (q.v.).

**Atlas.** One of the Titans, whose duty it was to bear the world on his shoulders. The most famous classical illustration is a metope at Olympia, which pictures him offering the apples of the Hesperides to Heracles. In modern art he has been represented by Lee Lawrie in a mammoth bronze statue at Radio City, New York. —W.R.A.

**atlatl.** The throwing stick of ancient Mexico.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

**atmospheric perspective.** See PERSPECTIVE.

**Aton.** Var. of Aten (q.v.).

**atonal idiom.** See twelve-tone technique.

**atonality.** See idiom (c); key.

**atonal music.** See twelve-tone technique.

**atrio.** Large walled forecourt of Mexican churches (rarely elsewhere in Latin America). In 16th cent. monasteries it was also in a sense the church of the Indians, for here they stood to witness the celebration of mass in the *open chapel* (q.v.), here they were taught catechism, singing, etc. Without *posas* (q.v.) and open chapel, it became a regular adjunct of later parish churches, retaining its central stone cross ornamental gateways and battlemented or crested wall. —J.Mc.

**atrium.** (1) The chief room of an ancient Roman house, an open court usually surrounded by a roofed gallery. (2) The open court before the narthex of a Christian church or basilica. See EARLY CHRISTIAN ARCHITECTURE.

**Attabi.** See ISLAMIC ART.

**attack.** In vocal music, the form of the approach to the main level of pitch, intensity, or timbre in music and speech. There are four forms: the level, the rising, the falling attack, and the portamento. In the legato and related styles the portamento prevails as a continuous glide from one note to the next. The rising glide is the most frequent in free attack. The falling glide occurs in downward passage in the scale. All gliding attacks in good music including the portamento carry the vibrato (q.v.). The level attack generally makes the tone disagreeably sharp-edged or stiff. The gliding attack is a form of artistic license which adds much to the mellowness of the tone. The glide may vary in extent (q.v.) and rate of change in pitch, intensity, and timbre. It may be several semi-tones and many decibels in extent and may occupy a considerable portion of the total duration of the tone. Many singers can be identified by their prevailing tendencies in these respects. Attack is usually thought of as pertaining to pitch, but the concept is equally applicable to intensity and timbre. The same applies in principle to many instruments. See *Iowa Studies in Psych. of Music,* Vols. I and IV.—C.E.S.

**attendant keys.** *Mus.* (1) Of a major key: the major keys with a tonic a perfect 5th higher and a perfect 5th lower; and the three relative minors. (2) Of a minor key: the minor keys with a tonic a perfect 5th higher and a perfect 5th lower; and the three relative majors. —F.M.G.

**Attic base.** The most common of all classic column bases. An upper and lower torus having fillets attached which are separated by a scotia. See base. —O.M.S.

**attribute.** Conventional symbol of identity. Such as Indra's *vajra* (q.v.).

**aubade** (Fr.). An early morning (dawn) open-air serenade or concert; a brief instrumental work of lyrical character.

**Aubusson.** A rug weave originating in France, seldom used as a floor covering and woven on either a high or low warp loom. All design lines which are parallel to the warp threads form a slit in the rug and must be sewn up later. —B.E.J.

**audiles.** See audiometer.

**audiometer, audiometry.** An instrument used in the measurement of keenness of hearing.

Musicians, like people in general, vary in their sensitiveness to sound. A sound that is audible to one may not be audible to another. It follows that this will affect not only their hearing of music but also their performance and direction of music. However, with progressive loss of hearing comes the power to make habitual allowance for the defect.

Persons who have fine auditory acuity live in a different world of experience and behavior from those who are dull in hearing largely because they tend to become **audiles**, i.e., to live in a tonal world, while others tend to become visualisers, i.e., to live in a visually constructed world. See C. C. Bunch, *Clinical Audiometry,* 1943, p. 186. —C.E.S.

**auditory form.** See PSYCHOLOGY OF ART.

**augmentation.** *Mus.* Doubling or increasing the time-value of the notes of a theme.

**aural newsreel.** See RADIO DRAMA.

**aureole (or glory) and mandorla.** In opposition to the nimbus (q.v.) or halo the aureole or glory is a splendor of light, surrounding not only the head, but the whole figure. It makes its first appearance in Greek painting, about the same time as the round nimbus.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

Like the latter it is originally enriched by rays on the periphery. It is probable that the Christian aureole, like the Christian halo, is derived from its classical predecessors; as in the halo, however, the rays on the periphery were omitted during the early Christian and medieval periods; this secondary influence of the Roman *clipeus* (q.v.) which has been suggested with regard to the circular nimbus, is even more evident in the case of the aureole (cf. Elderkin). In spite of these undeniable relations of the Christian aureole to classical antiquity, it should be observed that there were powerful biblical motives for the use of the aureole that were lacking in the case of the mere halo: I am referring for instance to the Transfiguration of Christ in which His body was surrounded by light and to other kindred events from the Old and New Testaments. As to the aureoles of various shapes that occur in Hindu and Buddhist art, they are of too late a date to make it very probable that they influenced the classical or the Christian aureole (see nimbus).

The aureole is a symbol that occurs much less frequently than the nimbus. The first Christian examples are to be found in some of the mosaics of the nave of *S. Maria Maggiore* in Rome, illustrating the Old Testament. In early Christian art the aureole is also found around representations of the Lamb, the Phoenix and the Cross, and at least from the 5th cent. onward around the figure of Christ, later sometimes also around that of the Blessed Virgin. While the halo became the ordinary attribute of Christ and the saints, the aureole, before modern times, was reserved for a restricted number of subjects, particularly for Christ in the Transfiguration, the Descent to the *Limbo,* the Ascension, the *Maiestas Domini* and the Last Judgement. The shape of the aureole is dependent upon that of the human body; therefore it is often elliptical, but can be circular, esp. in the case of an enthroned figure. The oval-shaped aureole is also called by the Italian term ***mandorla,*** because of its almond-like form. In medieval art the aureole or mandorla is not infrequently combined with the globes of heaven and earth above which Christ is enthroned; this arrangement lead to complicated geometrical figures. The aureoles of that period look often more like an adorned shield than like a zone of light. In post-medieval art the aureole is comparatively rare. See W. W. S. Cook, The Iconography of the Globe Mandorla, *The Art Bulletin* 6 (1924) 38 ff.; G. W. Elderkin, Shield and Mandorla, *American Journal of Archaeology* 42 (1938) 227 ff.; for the rest, see article nimbus. —G.B.L.

**aureolin.** A pigment of yellow color made from cobalt goes by this name. See cobalt pigments.

**Australian Aboriginal Art.** The art of the aborigines of Australia is limited by the cultural level of the people themselves. Wandering from place to place, yet always within the bounds of their own hunting grounds, these early Australian blacks expended most of their artistic efforts on their bodies and transportable goods.

They did, however, like most stone-age hunting hordes, leave behind them outline drawings of fish, reptiles, birds, animals, weapons and human figures. These were carved or painted upon rock surfaces and are to be found in many parts of the continent. The art of rock carving, which is now extinct, was commonly practised on flat rocky sites. The examples of mural painting, being more ephemeral than the carvings, are placed under the protection of overhanging ledges or on the walls of caves. Unlike most primitive art, these illustrations are neither grotesque nor exaggerated and are executed with surprising restraint. Silhouette stenciling of hands is a common feature of cave painting, esp. in New South Wales where stencils of feet and weapons frequently appear. Sometimes the silhouette is filled in with a second color. In all painting in Australia there is no blending or shading of hues.

In spite of a low cultural development, the totemic lore and ceremonial rituals of these people appear very complex and depend to a great extent for their visual expression upon a symbolic type of art. Since much emphasis is placed upon the initiation of the youths, and as only the men take part in the sacred ceremonies, the women of the tribe have little understanding of the esoteric nature of the art forms.

The traditional and symbolic designs are made up of geometric and biomorphic elements which are based originally on nature forms. For example, a wavering line usually signifies a snake, while cross-hatching may symbolize water. Concentric circles, diamonds, lozenges, and triangles are basic forms. Oval shapes, serpentine zigzags, and dotted lines appear in great variation, while the use of herring-bone and chevron patterns are typical of certain regions.

In all these elements it may be noted that the principal characteristic is repetition. Lines,

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

angles, and arcs are paralleled in a series. One shape is fitted within another. Even the backgrounds may be little more than a field of white dots.

Most sacred designs are closely associated with corresponding songs and chants, esp. those symbols which are found on the *Tjuranga* and ***churinga*** (sacred wooden or stone forms which are decorated with totemic motifs). In fact many of these designs are made to the accompaniment of particular songs which are also sung when the object decorated by the symbol is displayed. This close association of music with design most likely accounts for much of the repetitive nature of the visual form where the beat of the song is reflected in the dotted backgrounds and the paralleling of lines.

Besides the *Tjurunga* and *Churinga* clubs, spears, spear-throwers, boomerangs, shields, and bull-roarers are all decorated with symbolic designs usually of an abstract character. These are usually applied by incising or fluting the surfaces, the various geometric shapes being adapted to the particular areas to be ornamented. In the case of larger surfaces, such as found on shields, it is a common practice to use paint and even feather-down which is stuck on with blood. Often two or more techniques are combined. For example, the flutings and incisions are often filled with color in order to bring out the pattern. These pigments are the same as those used in mural painting and are common to most Australian art. The red and yellow are made from the ochres; white is produced from pipe clay and the black is made from charcoal. The pigments are mixed with grease and at times even with water. They are applied with the finger or with the aid of crude brushes.

Some mention must be made of the ceremonial paraphernalia made of feathers. While white feather-down is applied along each side of red or black lines traced onto the body, sacred feather banners are made up for each ceremonial ritual. While they are often carried as sacred banners in the totemic and historical ceremonies of northern and central Australia, they are also stuck in the ground and at times even worn as eleborate headdresses. They are known as ***nurtunja*** and ***waninga*** and represent the totem of the clan.

Earth drawings are also used for religious ceremonies, esp. in Central Australia. These are made on a circular area often six feet in diameter. After the ground has been suitably smoothed and dampened, the totemic designs of concentric circles and scrolls in a field of white dots are carefully painted in with the traditional colors. A new drawing is used for each day of a religious festival.

Symbolic designs similar to those used on weapons are also deeply engraved on tree trunks in the New South Wales and Queensland areas. These are used for religious ceremonies and are believed to have some mythological significance.

For the scholar of art the bark drawings from western Arnhem Land and the decoration of the baobab nuts in the Kimberly District are of particular interest as they show the decorative use of nature forms. The former are painted on the bark sheets forming the walls of huts and have some religious implication. Fish and kangeroos are commonly depicted in profile. The unusual aspect of this type of art is the portrayal of the internal structure of the creature which gives the drawing somewhat the appearance of an X-ray plate. The skeleton, the spinal column, and the alimentary canal are usually most conspicuous. Such treatment of animal forms is rare even in primitive art.

The painting and incising of baobab nuts show the skill with which the Australian artist can use animal motifs for allover decoration. Representations of emus, turtles, plants, and flowers are common, the outlines often being filled in with dots.

Twine baskets, skin rugs and mantles, bark belts and shell ornaments are all decorated with the customary designs adapted to localized traditions. The various articles themselves are often typical of particular regions. Whether these abstract and semi-abstract designs have symbolic and religious interpretation when applied to such mundane objects is still an unsolved problem which is fortunately of little consequence to the scholar of art.

There is much to be learned from a perusal of the wealth of colorful designs which appear in Australian art. The graceful curves and the interesting silhouettes of weapons and many of the totemic symbols offer much source material for the designer of to-day. Good color plates and lucid explanations are to be found in museum publications and especially in the Memoirs of the American Philosophical Society, Volume V, 1936, and Volume IX, 1937. See *A Preliminary Consideration of Aboriginal Australian Decorative Art,* 1937 and *Aboriginal Australian and Tasmanian Rock Carvings and Paintings,* 1936, Daniel Sutherland Davidson; *Australian Aboriginal Art,* Barrett and Kenyon, 1929; *Australian Aboriginal Decorative Art,* F. **Australian Contemporary Art,** like the contemporary art of many other countries, shows a variety of tendencies and directions which range from academic naturalism to modernism. However, on the whole the conservative group, i.e. Australian impressionism, is dominant and the value of modern tendencies in art was the object of lively controversies as late as 1940.

The year 1885 may be given as the beginning of the Australian school of painting which means primarily an art that depicts truthfully the peculiar characteristics of Australian landscape—a task which is often considered to be one of the most important for the Australian artist to undertake. Tom Roberts (1856—1931), returning from Europe in 1885, brought with him some landscapes painted in the impressionistic style which greatly influenced such painters as Frederick McCubbin (1855—1917), Charles Conder (1868—1909), Sir John Longstaff (1862—1941), Sir Arthur Streeton (b. 1867) and others. Under the influence of impressionism and "plein air" painting, Australian artists broke away from the academic studio painting; they were brought in contact with their own landscape and they were made aware of the subtle color schemes in their native surroundings. However, Australian impressionism maintained a great degree of careful draughtsmanship which has given it a peculiar character of its own. This new type of paintting was first presented to the public at an exhibit in 1889 in Melbourne and was greeted with sharp adverse criticism. Such opposition did not, of course, prevent the growth of Australian impressionism which, as a result of the efforts of the artists just mentioned and such men as Julian Ashton, Max Meldrum (see Meldrum, school of) and others, rose to the dominant position it still holds.

Typical of this kind of impressionism are Conder's *Departure of the S. S. Orient,* 1888; McCubbin's *On the Wallaby Track,* 1890; Streeton's *Golden Summer,* 1889; *Still Glides the Stream,* 1890; *Road to Corryong,* or his more recent painting *Passing Showers,* 1937. Tom Roberts painted a series of large canvases depicting scenes from the life in the Australian bush, e.g. *The Breakaway, The Golden Fleece, Shearing the Rams,* 1890, *A Mountain Muster* and *Bailed Up.* The last picture was painted with great care as to correct details from a model (i.e. a reenacted scene); it was started in 1898 and completed in 1928 (almost all the background being repainted) when it was acclaimed by Lionel Lindsay as part of Australian history and "completely removed from the category of academic story" (from the foreword to the catalogue of the exhibit at the Macquarie Galleries, Sidney).

The painter Hans Heysen (b. 1877) pointed out that the work of Roberts and Streeton made him and his friends realize that the atmosphere and color values of their landscape were quite different from the relatively low tones favoured in the English paintings of the time. In a great number of water colors and oils Heysen has embodied the results of this experience as for instance in his water colors from the Arkaba country (1927) in which he has depicted faithfully the subtle color gradations, the light effects as well as the structure of the Australian landscape.

Elioth Gruner (1882—1939) represents in a sense an intermediary stage in the development of Australian art. In his earlier works *Morning Light* or *The Valley of the Tweed* he, like J. J. Hilder (e. g. *At Close of Day*), shows sentimental and lyric qualities which appealed to the public and which helped to widen the popular interest in the Australian impressionism begun by Streeton, Roberts, et al. In this earlier phase the study of colour gradations and tonal values are dominant over structural form. The later phase of Gruner's work, as a result of his acquaintance with G. W. Lambert (returned from Europe) and his own stay in Europe, shows a change towards greater emphasis on form and design and greater clarity and simplicity of colours, e. g. *Devonshire Landscape,* 1925; *The Little Farm,* 1926.

The development of Elioth Gruner illustrates the changes taking place in Australian art and the transition from impressionism to modern art. When using the term "modern" one should remember its relative character; thus, in Australia, the term is applied to Rupert Bunny, whose work has been likened to that of Bonnard and Vuillard (e. g. *Olive Trees, Le Lavandou; Self-Portrait,* National Gallery, Melbourne), as well as to abstractionism and surrealism. Different and divergent as the work of the various moderns may appear they have certain aims in common—analysis and emphasis of the formal values of artistic composition. The intense interest in and the scrupulous observation of peculiar

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

Australian light and color effects had led to a neglect of the formal values of pictorial composition. Under the influence of Cézanne, van Gogh and Gauguin the moderns realized the necessity of a reconsideration and re-evaluation of the traditional principles and values of Australian "plein art" impressionism.

According to Roland Wakelin (*Art in Australia,* December 1928), the art of van Gogh, Gauguin and Cézanne became known in Australia ca. 1913. Color reproductions and the reports of Miss Nora Simpson, returning from England at about this time, inspired Wakelin and Roi de Mestre, who were studying at the Royal Art Society, Sidney, to experiment with intense and bright colors and draw in a cubistic manner. Their attempts met, of course, with opposition but A. Dattilo-Rubbo defended them as well as his pupils (Miss Simpson and Miss Grace Cossington Smith) and some of their works were accepted at the annual exhibitions of the Royal Art Society in 1916-18—without enjoying much popularity with either critics or public.

The period after the first world war saw a gradual growth of the modern tendencies among Australian artists—some of whom had come in contact with modernism in Europe during the war—and in November 1926 a number of those interested in modern art exhibited for the first time as a group at the Grosvenor Galleries, Sidney. Among the members of this group were Elioth Gruner (cf. above), G. W. Lambert, Kenneth Macqueen, Margaret Preston, Thea Proctor, Vida Lahey, John D. Moore, Roland Wakelin, Roi de Mestre and they were joined in the following year by Adelaide Perry, Grace Cossington Smith, Aletta Lewis, Mildred Lovett and Joseph Connor. In connection with the rise of Modernism in Melbourne (beginning ca. 1925) the names of William Frater, Arnold Shore, George Bell, Isabel Hunter Tweddle, Adrian Lawlor and Eric Thake should be mentioned.

George W. Lambert (1873—1930) was a most versatile artist, equally accomplished in painting as well as sculpture, e. g. the *Henry Lawson Statue, Memorial for Roman Catholic Soldiers and Sailors, St. Mary's Basilica,* Sidney, (assisted by Arthur Murch). Lambert exerted a great influence after his return from Europe in 1921; his "modernism", however, is actually an insistence upon a return to values of the earlier traditions of pictorial composition in the direction of classicistic form, e.g. *Important People,* 1921; his *Weighing the Fleece,* 1921, and *The Squatter's Daughter* have often been referred to as examples for the renewed emphasis upon solid and constructive form.

In such paintings as *The Red House* or *Bay Road* of Roland Wakelin (b. 1887) the influence of Cézanne is discernible in the somewhat cubistic design of the picture. However, there is an emphasis on strong colours and in his later work (e.g. *St. James, Romantic Landscape,* 1937) colour is the carrier of the simplified design. Kenneth Macqueen (b. 1897), who manages his own farm in Queensland, combines in such water colors as *The Green Hill,* 1929; *Evans's Farm,* 1929, decorative design with authenticity of observation, while in his later work (e.g. *Cabbage Gums and Cypress Pines*) there is a freer handling of the natural forms and greater strength and movement of composition.

Margaret Preston (b. 1883) in *The Indigenous Art of Australia* (*Art in Australia,* March 1925) was the first artist to suggest the application of aboriginal art to modern design, and to advocate taking the art of aborigines as a basis for "an art for Australia from Australians" (*Art in Australia,* November 1940). In a great number of still lifes she has employed local forms and colors and in such later works as *Coral and Banksia,* 1939, *Aboriginal Still Life,* 1940, she shows well balanced strong colors and great vigor and firmness of design. In the work of Grace Cossington Smith strength and clarity of design are combined with a treatment of color that is reminiscent of van Gogh, e.g. *The Bridge Curve, Things on an Iron Tray on the Floor.*

George Bell (b. 1878) who, together with Arnold Shore (b. 1897), established a modern art school at Melbourne considers "abstractions" necessary for formal analyses and exercises. The results of these analyses he incorporates in paintings composed of wide planes in simplified design (e.g. *Lulworth Cove*). In such compositions as *Metamorphosis* Arnold Shore accentuates color strongly and in a manner reminiscent of van Gogh.

While some of the Australian artists had thus established contact with European modernism, the general public did not see a comprehensive exhibit of modern art until 1939. As a result of the efforts of Sir Keith Murdoch, the collector, and Basil Burdett, art critic for the *Melbourne Herald,* the *Herald* organized a travelling exhibit which comprised works of Cézanne, van Gogh,

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

Gaughin, Seurat, Picasso, Derain, Utrillo, Braque, Modigliani, Vlaminck, Bonnard, Steer, Tonks, John, Nash, Maillol, Epstein and others. The public in general did not respond very enthusiastically to this exhibit nor did the representatives of the conservatives among the artists and gallery directors, if the following statement by James S. MacDonald, Director of the National Gallery of Victoria, can be taken as an example. Mr. MacDonald wrote in 1940: "The art that Australian modernists profess is imported and is foreign to this relatively happiest of countries. The importers body-snatched the corpse abroad, smuggled it in, warmed it up. For it is dead, even if it has not yet lain down. European insecurity begat this yelling, shocking art . . . The distraction this leprous art furnished was pounced upon by overseas picture dealers and newspaper writers . . . They saw in it, respectively, profit and notoriety, . . . " (quoted from C. H. Grattan, *Introducing Australia,* 1942).

However, such adverse criticism in high quarters should not be interpreted to mean that the Australian artists of today are completely conservative and intend to remain so. In addition to those painters mentioned above, there is a very vigorous group of artists who are willing to take the risk of experiment and to face adverse criticism. They find support in the periodical, *Art in Australia,* (founded 1916 by Sidney Ure Smith) which, while not preferring uncritically everything modern, points out the necessity for judging modern art on its own grounds and makes a plea for the official recognition of an art which truly reflects contemporary attitudes. Thus in June-July-August 1941 *Art in Australia* editorializes, "Contemporary art means the true art of today . . . 1941 cannot be interpreted in the language of 1870 . . . Unfortunately, we possess too many painters, young and old, producing pale echoes of the Victorian era, and they are encouraged!"

Among the moderns, of whom only a few can be presented here, the following artists should be mentioned. Peter Purves Smith (b. 1913) develops his pictures in terms of simplified, subtly coloured planes without suppressing the expression of human qualities (e.g. *The Promenade,* 1938, *The Diplomats,* 1939). George Russel Drysdale (b. 1912), using colour with sensitivity, in such compositions as *Sunday Evening* and *Feeding the Dogs* sets the verticals of his elongated figures and trees against the horizontals of a wide landscape which seems pervaded by a gentle melancholy. William Dobell (b. 1899) in a fresh approach to portrait painting subordinates accurate representation of his models to an analysis of expressive characteristics of their personality, e.g. *Squadron Leader G. U. 'Scotty' Allan, Portrait of a Strapper, The Student.*

The forms of Eric Wilson's (b. 1911) compositions seem to grow out of the swirling movement of colors, e.g. *In the Train,* 1924; *Mother and Son,* while his *Theme for Mural* and *Kitchen Theme* show the influence of Picasso. William Constable (b. 1906) in his stage designs has broken away from the traditional and conservative stage settings and works with strong color and bold, imaginative shapes (e.g. *Design for an Aboriginal Ballet,* No. 1 and No. 2). Elaine Haxton's work shows the influence of her stay in Europe and in the United States, as for example, her gouache *Early Colonial Architecture,* 1940, which, in the handling of color and space has something of the sophisticated effects of Raoul Dufy.

One of the spokesman of surrealism in Australia, Adrian Lawlor, author and painter, in *Banner of Blood, Symphonic Poem,* etc., gives expression to imaginative insight, accentuating emotional qualities rather than formal values. Somewhat in the manner of Dali, Eric Thake (b. 1904) in *Archaeopteryx* places realistically painted objects in fantastic juxtaposition. James Gleeson, Gordon Andrews, Albert Tucker, Max Ebert present the symbolic imagery of surrealism, while Geoffrey Collings and Alistair Morrison create abstractions emphasizing formal values.

In the field of sculpture the situation is similar to that in painting; the conservative and academic element is dominant and is best represented by such works of Sir Bertram MacKennal (1863-1931) as *Circe* (National Gallery, Melbourne), *The Earth and the Elements, Diana Wounded* (both in the Tate Gallery), and by a great number of memorials in Australia, England and India. C. W. Gilbert (1866-1925) and Harold Parker (b. 1873) are other representatives of an academic naturalism which, in the case of Gilbert shows some influence of Rodin.

Rayner Hoff (1894-1937), who was the first instructor at the first school of sculpture in Sidney (established 1924), departed from the traditional directions and shows in his figures for the *Anzac Memorial,* Sidney, a great restraint and a concentration upon the essential forms which is well suited to the theme represented. Ola Cohn's work is characterized by

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

an accentuation of plastic values to which the shape of the natural objects depicted is subordinated (e.g. *Penguin*).

Among the Black and White artists David Low (New Zealand, b. 1892), since 1920 in London, is probably most widely known through his political satires which are characterized by an economy of line, a quality which is also cultivated by C. E. Finey (New Zealand, b. 1895) who contributes to various Sidney newspapers. There is a certain literary sophistication in the work of Will Dyson (b. 1881, in London since 1930) and his wit is rather subtle, e.g. his etchings satirizing psychoanalysis. Lionel Lindsay (b. 1874) who, through his contributions to *Art in Australia* has helped to make Australian artists known in their country, follows in his many etchings, drawings and water colours the criticism which he applies to others. ". . . The idiots who listen to modernistic critics," says Lionel Lindsay, "cannot see that . . . the best painting . . . is representational. Cezanne owes much of his fame . . . to his faults of drawing, . . ." (*Art in Australia*, 1928). There are none of the "faults" of Cezanne in Lionel Lindsay's work which follows the conservative line of Australian impressionism. So does the work of his younger brother Norman Lindsay (b. 1879) whose etchings are filled with a great number of carefully executed details (e.g. *The Garden of Happiness, Enter the Magicians, Dionysus*).

Among the moderns a sensitive note is struck by Donald Friend in his delicately executed wash drawings. Francis Lymburner stresses the importance of drawing as a medium in which sculptor and painter may meet. James Gleeson presents his poetry in the fantastic forms of a surrealistic design. See William Moore, *The Story of Australian Art*, 2 vols., 1934; *Art of Australia* 1788-1941, compiled and edited by Sidney Ure Smith, O.B.E., 1941; *Art in Australia*, A Quarterly Magazine (founded 1916). —H.H.

**AUSTRIAN ART.** Already in prehistoric times important works of art were produced on Austrian soil, e.g. the so-called *Venus of Willendorf*. Numerous discoveries in settlements and burial places in Lower and Upper Austria furnish ample evidence of artistic activity. Particularly important are the discoveries relating to the Iron Age (from the 8th to the 5th cent. B.C.) known as the *Hallstatt* period after the town near which excavations were made. From the 1st to the 5th cent. A.D. the areas along the Danube, Upper and Lower Austria, and on the eastern fringe of the Alps, Carinthia and Styria, were colonized by the Romans, who founded the larger settlements of Carnuntum, Loriacum, Virunum, Vindobona (Vienna). Roman mosaics, idols, notably of Mithras, sculptures like the *Athlete of the Helenenberg*, have been found in many places. The transition from the provincial Roman style to the style of the migrations can be best studied in ornaments and jewelry. The remains of barbarian cemeteries illustrate the art of the age of the migrations from the 4th to the 7th cent. A.D.

Latin culture was of decisive importance for further artistic development in Austria. Christianity was introduced at an early date. In the 8th cent. the first great monasteries and bishoprics were founded. Austrian medieval culture was chiefly ecclesiastical with its main strongholds in the numerous abbeys and monasteries, and spread from ecclesiastical centers, notably Salzburg. The Pre-Carolingian, the Carolingian, and the Ottonian periods, from the 8th to the 10th cent., are represented in Austria by remarkable works of art: e.g. the Tassilo chalice in Kremsmünster; the murals in Mals and Naturns in South-Tyrol; the ivories from St. Paul and Seitenstetten. Byzantine works of the minor arts were imported.

The Romanesque period in Austria covers the 11th, 12th, and most of the 13th cent. According to the traditional character of the Austrian people, it lasted longer here than in France and Germany. From the Romanesque period onward more numerous works of art have been preserved. Their chief importance lies in the field of architecture and painting (frescoes and illuminated books). Outstanding works are the monastic basilicas of Gurk, Millstatt, and St. Paul, all in Carinthia; Seckau in Styria; Heiligenkreuz, Klosterneuburg, and Lilienfeld, all in Lower Austria; Nonnberg and St. Peter in the city of Salzburg; the Cathedral of St. Stephen's in Vienna (West façade) and the old "Dom" of Salzburg (now replaced by the Renaissance structure). In these works are blended Lombardian and German influences. Plastic decoration concentrates on the portals, e.g. the Riesentor of St. Stephen's. Smaller buildings such as parish churches (Schöngrabern in Lower Austria) and round chapels (so-called "Karners") are often distinguished through richness of tectonic and plastic decor. The walls of the Romanesque interiors offered ample space for fresco painters to display their works. The West-Gallery of the cathedral of Gurk contains the most important and best preserved Romanesque murals of central Europe. Other examples

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

are: Nonnberg, Pürgg in Styria, Brixen (now Bressanone) and Hoch-Eppan in South Tyrol. A remarkable school of book-illumination developed in Salzburg. The Abbey Klosterneuburg commissioned a multi-panelled altarpiece (completed 1181) from the Master Nicholas of Verdun, which remains the greatest work of Romanesque goldsmith art in the western world.

The Gothic style filtered through in the late 13th cent. but only gradually. While Romanesque art is mainly connected with the Benedictine order, the Cistercian and Dominican monks had an important share in spreading Gothic art as evident in the early examples: Heiligenkreuz; Friesach in Carinthia.

The flowering of Gothic art comes in the 14th cent., and extends through the 15th cent. Important schools of sculpture and painting developed. The court and the nobility played an increasing part as patrons of the arts. In the 14th cent. Vienna was a meeting place of great architects, sculptors, painters, glass painters, and goldsmiths. The Romanesque cathedral of St. Stephen's, due to the munificence of King Premyzl Ottokar of Bohemia, received a Gothic choir and naves under the Habsburg Dukes, Albert and Rudolph the Founder (*der Stifter*). The latter competed with the court of his father-in-law, Charles IV. in Prague, in making his residence a center of art and culture.

The period of High-Gothic extends in Austria throughout the 14th cent. The main examples in architecture aside from St. Stephen's are the Maria Stiegen church, the Minoritenkirche (Church of the Fratres Minores), and the Augustiner-Kirche, all in Vienna; the cloisters in Klosterneuburg, the monasteries of Zwettl and Neuberg. As in architecture, also in sculpture French influence prevailed at the beginning of the century. Works of classical beauty arose such as the virgins of Klosterneuburg and Wiener Neustadt by a sculptor trained in France, the *Servant's Virgin* in St. Stephen's. Later in the century, a specific Austrian variety of the Gothic style developed, largely inspired from Bohemia. The workshop of the master masons of St. Stephen's was connected with those of Prague and Ratisbon. Austria had a predilection for the spacious type of the so-called Hall-Church, characterized by the equal height of the naves. Gothic transcendentalism created in St. Stephen's tower one of the most fascinating works. The same feeling distinguishes the portrait sculptures of the Dukes which adorn it, and the windows of the contemporary glass painters. A remarkable school of panel painting developed in Vienna after the beginning of the 14th cent. as manifest in the wings of the Verdun Altar. In the 15th cent., the century of Late Gothic, panel painting, wood-carving, and the graphic arts increased in importance. Leading schools of painting were those of Lower Austria, mainly Vienna, and Styria. Glow of color and highest pictorial refinement prove the affinity of Austrian panel painting of the early 15th cent. with the schools of Paris and Burgundy. With the decline of Bohemian art, native Austrian art rose in importance. The rising era of naturalism brought forward outstanding artistic personalities like the anonymous Master of the votive panel of St. Lambrecht and of the crucifixion in the Museum of Linz, the Master of the Carrying of the Cross from the Worcester Collection (now in the Institute of Fine Arts, Chicago), the Master of the Albrechtsaltar, the Master of Schloss Lichtenstein, Konrad Laib, and the sculptor Jakob Kaschauer. With artists like the Master of St. Wolfgang and the Master of the Mount Calvary, Austria contributed to the history of early engraving. In the 2nd half of the 15th cent., monumental altarpieces fitted with movable wings, consisting of wood-carvings and painted panels, became a specific artistic creation of the Austrian mountain and Danube countries. Tyrol, at that time, had the leadership. Michael Pacher, the greatest painter of the German speaking nations in the 2nd half of the 15th cent., was also a great sculptor. He created the altarpieces of Gries and Brixen in South Tyrol, and as the most famous, the St. Wolfgang Altar (1471-1481). Great painters like the Frueaufs in Salzburg contributed to altarpieces of this kind. Other important altars are: Kefermarkter Altar (Upper Austria), Schottenaltar (Vienna), of which only the paintings are preserved. Local communities gained increasing importance as patrons in this development. Many old Austrian cities received their characteristic features in this period, such as Steyr, Hall, Innsbruck. Among outstanding late-Gothic architects may be cited: Michael Knab and Hans Buchsbaum, the builders of the towers of St. Stephen's, Anton Pilgram, the creator of the pulpit and the organ gallery in St. Stephen's. Among the outstanding sculptors, foreign and native, were: Nicolaus von Leyden (Tombs of Emperor Friedrich III. and Eleonora of Portugal), and Lorenz Luchsperger.

The beginning of the 16th cent. brought an overlapping of Late Gothic and Renaissance. Signs of a new artistic period appear after

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

1500. Renaissance forms were introduced from Italy, but developed in the Late Gothic spirit. The distinction between Early and High-Renaissance, valid for Italy, is not applicable to Austrian art of the period.

During the first half of the 16th cent. the art produced for the court and for wealthy citizens takes precedence over ecclesiastical art. The reign of Maximilian I. (1493-1513) was an era of special splendor. It was distinguished by a great school of painting, centering in the Danube valley, one of whose achievements was to create an independent art of landscape painting and drawing. The **Danube School** (so-called because its main works originated chiefly between Passau and Vienna) was formed in Austria. The Austrians Rueland Frueauf the Younger, Marx Reichlich, Jörg Kölderer, Wolf Huber participated just as did the South Germans Lucas Cranach, Jörg Breu, Albrecht and Erhard Altdorfer. The main works of this school were painted for Austrian patrons and are still preserved in Austria (e.g. Altdorfer's altar at St. Florian, 1518). The Austrian spirit and the poetical charm of Austria's scenery largely shaped the character of the Danube School. The most prominent monument of Renaissance sculpture in Austria is the tomb of Maximilian I. in the Hofkirche at Innsbruck, mainly a work of Tyrolian artists in which also the German sculptors Veit Stoss and Peter Vischer participated.

The Late Renaissance covers the 2nd half of the 16th cent. and continues during the first decades of the 17th cent. It brought a complete victory of Italian forms. Austria as a Catholic country was open to the influence of the South in the period of the Counter-Reformation. Italian artists received great commissions (e.g. "Dom" of Salzburg). The international culture of court and aristocracy during the reign of Emperor Rudolph II (1576-1612) patronized Italian and Netherlandish artists to an equal extent.

Another great flowering period of Austrian art is the Baroque. Its roots are international, and Italian artists working in Austria had an important share in it (e.g. Burnacini, Carlone, Allio, Pozzo). We distinguish the periods of the Early Baroque (1st half of the 17th cent.), High Baroque (about 1650-1720), and the Late Baroque which in Austria goes over into the period of the Rococo, coinciding with the reign of the Empress Maria Theresa (1740-1780). Out of the international premises grew a genuine and national Austrian baroque art. Its climax was at the beginning of the 18th cent. marked by the activities of a group of great architects. Vienna, flourishing after the victorious repulse of the Turks (1683), was the leading center of this activity. The era of the greatest Baroque splendor was during the reigns of Joseph I. (1705-1711), and Charles VI. (1711-1740). Baroque art answered not only the demands of the court and of the aristocracy for a magnificent representation but also involved a revival of religious art. Many medieval abbeys were rebuilt on a grand scale: Klosterneuburg, Melk, Göttweig, Kremsmünster, St. Florian, Wilhering, Wilten. The most outstanding architects were: Johann Bernhard Fischer von Erlach, 1656-1723 (main works: Kollegienkirche, Salzburg; Karlskirche, Vienna; Castle Frain, Moravia; projects for Schönbrunn and the Hofburg; Imperial Library, Winter Palace of Prince Eugene, Palais Trautson, all in Vienna); Joseph Emanuel Fischer von Erlach, 1693-1742 (Hofburg Reichskanzlei); Johann Lucas von Hildebrand, 1668-1745 (main works: Belvedere, Palais Schwarzenberg, Palais Kinsky, Peterskirche, all in Vienna; Monastery Goettweig); Jakob Prandtauer, 1660-1726 (main works: Monasteries Melk, Herzogenburg, Dürnstein, with the assistance of Joseph Mungenast); Matthias Steinl, 1644-1727, who designed the famous towers of Dürnstein and Zwettl.

The leading sculptors of the Baroque were: Georg Raphael Donner, 1693-1741 (Fountain on the Neuer Markt in Vienna), Balthasar Permoser, 1651-1732, and J. T. Stammel who continued the Late Gothic practice of wood-carving (*Allegories of the Four Last Things* in Admont). The works of the architects were embellished by the spirited frescoes of Johann Michael Rottmayr, Daniel Gran, and Paul Troger.

In the era of Maria Theresa, architecture was kept on a modest scale while painting reached an unsurpassed climax in the art of Franz Anton Maulbertsch (1724-1796). The pious mood of the contemporary Austrian ecclesiastic music (Haydn, Mozart) found a pictorial counter-part in the works of Maulbertsch and Martin Johann Schmidt (known as Kremserschmidt).

The era of neo-classicism during the reign of Francis I. gained greater importance through the creations of Beethoven and Schubert than through the works of its painters and sculptors although distinguished artists like Friedrich Heinrich Füger and Franz Anton Zauner were active.

The bourgeois era of the "Vormärz", between the Congress of Vienna, 1814, and the Revolution of March 1848, developed on one

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

hand a religious and poetical romanticism in the works of Moritz von Schwind, Joseph Führich, and Scheffer von Leonhardshoff, and on the other hand a cultured and intimate pictorial naturalism in the works of Joseph Danhauser, Peter Fendi, Carl Schindler, Friedrich von Amerling, and Rudolf Alt. Georg Ferdinand Waldmüller (1793-1865) developed in his landscape paintings a vision of nature whose grandeur is paralleled only by the simplicity and straightforwardness of his portraits.

Historical styles in architecture flourished during the era of Francis Joseph I. The city of Vienna received its 19th cent. features (Ringstrasse with Opera House by Van der Nuell and Siccardsburg; Parliament; City Hall; Neue Hofburg). Hans Makart and Hans Canon revived a decorative baroque style in painting; August von Pettenkofen developed an Austrian impressionism, while Anton Romako foreshadowed expressionism.

Of greater creative importance became the following decades of the 20th cent. when Austrian art took the lead in the development of modern architecture (Otto Wagner, Adolf Loos) and progressive art of painting (Gustav Klimt, Egon Schiele, Oskar Kokoschka, Herbert Boeckl). **auxiliary notes.** *Mus.* Notes which are not essential to the harmony or melody; grace notes.

**auxochromes.** See COLOR.

**Awata yaki** (Jap.). A pottery ware made at Awata, Kyoto.

**axis.** See PERSPECTIVE.

**Axminster.** A rug carpet originally known as Moquette; an invention of Halcyon Skinner in 1876. Originated in Axminster, Devonshire, England, the seat of the imitation Oriental carpets known as Axminsters. It is a carpet with a chain of cotton or jute and a woolen or worsted filling; a heavy pile. —G.W.R.

**Axminster loom.** Three fundamental features in the construction of an Axminster loom are: (1) the employment of yarn spools in the production of a figured pile surface; (2) the insertion into the carpet structure of tufts of pile yarn in one of two forms: (a) by cutting the yarn from the spools after being placed and secured in the carpet, and (b) by cutting the yarns from the spools into tufts-pieces and then inserting such tufts into the carpet; (3) the passing of the shots of weft into the sheds in the warps by means of a needle carrier. —B.E.J.

**Axminster, machine made.** First known as Moquette and later as Royal Axminster. Developed in the U.S.A. and involves the use of highly intricate machinery which does the work of human fingers by looping each individual tuft of wool into the body of the fabric. Two distinct types, narrow width and seamless. The loom is equipped with a series of spools on which the pile has been wound. Each spool wound with different colored yarns represents a row of tufts in the rug. The spools are hand set according to the designers' pattern and are mounted in a long, endless chain which brings each spool off the chain and causes it to insert the yarn ends through the warp. A comb underneath the fabric loops the yarn around the filler or cross thread and the knives like giant scissors cut the rows of tufts,

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

The spool is put back on the chain, the next spool is put into position and the process is repeated.

Two things are outstanding about Axminster: It has unlimited color possibilities beyond any other woven floor covering, and the weave is produced in a greater yardage than any other in America. Axminster is woven today up to 18 feet wide, seamless. An Axminster is easily distinguished from any other weave because the fabric can be rolled lengthwise but is the only weave which cannot be rolled crosswise. This is due to the stiff jute construction. Axminster bears the closest resemblance to a hand-knotted carpet in its structure. This is owing to the fact that both are tufted, but in the Axminster the tufts of wool are inserted mechanically in rows and bound down in the weft but are not knotted. Each tuft shows on the surface and forms part of the design. None of the tuft yarn is buried in the back of the fabric, as it is in the Wilton weave, other than that which is required for attachment to the weft. The preparation of the yarns for weaving Axminster is a long process and takes weeks, while the actual time of weaving requires about one-tenth of the entire time of manufacturing. —B.E.J.

**Ayyubid art.** See ISLAMIC ART.

**Aztec.** The term sometimes applied to the inhabitants of Tenochtitlan, the ancient Mexico City, but better used for the culture of the independent groups inhabiting central Mexico from 1300 to the Spanish Conquest in 1519-21. Theirs was a strong theological art based on a religion strongly stressing a cult of human sacrifice. —G.C.V.

**azure.** *Her.* Blue.

**azure dragon.** See SYMBOLISM IN FAR EASTERN ART.

**azurite.** Common among the blue pigments of the Middle Ages and the Renaissance, this is now available only as a pure mineral. It is a basic copper carbonate and occurs in many parts of the world in secondary copper ore deposits. There it is often associated with malachite, the green basic carbonate of copper. The blue stone was ground and purified but retained something of its crystalline character. Because of the extensive labor in its preparation, azurite went out of use when artificially prepared blues came in to take its place. —G.L.S

**Babylonian art.** See MESOPOTAMIAN ART.

**Bacchanals.** The Greek vegetation-god, Dionysus (Bacchus), was attended by ecstatic dancing women called Bacchanals (Bacchantes), whose worship was a favorite subject of many Greek vase-painters and sculptors. The best description of their rites is given in the choral odes of Euripides' *Bacchae*. Scopas, one of the leading sculptors of the 4th cent. B.C. made a famous statue of a Bacchanal, which may be reconstructed from a statuette now in Dresden, picturing a woman clad in a short Doric peplos, with her head thrown back, hair windswept, and hands brandishing a goat which she has killed in her frenzied revels. In neo-Attic reliefs and on Arretine pottery the subject was a popular one, giving artists the opportunity to represent groups of lovely dancers swinging along in joyous abandon. Titian and Tintoretto used the theme in their paintings of Dionysus discovering the deserted Ariadne on the island of Naxos. —W.R.A.

**Bacchus.** See Dionysus.

**bachiru** (Jap.). Ivory, tinted with a surface color, and incised to show the design in the original light tone.

**backbone.** *Book*. The same as spine, the back of a bound book.

**backdrop.** See STAGESETTING.

**backed.** See EDITION BINDING.

**background.** See STAGESETTING.

**background music.** Industrial music which is soft and sweet enough to be pleasant but nondistracting to workers at tasks requiring considerable concentration. —W.A.K.

**backing.** *Book*. A hammering process by which the sections are bent over at the back, so as to form grooves into which the boards forming the two sides fit.

**Backstein Gotik.** See brick Gothic; GERMAN ART.

**badacco.** See baldachin.

**Baga, art of the.** See AFRICAN NEGRO ART.

**Bagafore art.** See AFRICAN NEGRO ART.

**bagatelle.** A trifle. A musical sketch or short piece in a light style.

**Baghdad cloth.** See baldachin.

**Baghdad wool.** A dark carpet wool from Mesopotamia.

**bagpipe.** See MUSICAL INSTRUMENTS.

**Bakelite.** A synthetic substance combined by L. H. Baekeland, a native of Belgium and since 1889 a distinguished inventor and scientist in the United States. This new plastic, named after its inventor, is described as "a chemical synthesis from phenol and formaldehyde, replacing hard rubber and amber for uses in electricity and industrial arts where former plastics are unsuited." Baekeland started the commercial development of the substance in 1907. Like other plastics, bakelite has insulation properties, is not subject to corrosion and chemical action, is malleable, has great strength and hardness, can be easily treated for color and finish, and maintains a high degree of uniformity. It has been found an invaluable substitute for shellac, being electrically and thermally resistant, and is used for all electrical equipment which requires insulation or nonconduction. In the accessories of everyday life

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

phonograph records, buttons, billiard balls, pipestems, and umbrella handles of bakelite are in common use. —W.S.R.

**baking.** See CERAMICS I.

**balalaika.** A kind of guitar, usually triangular with a long neck and two or three strings. Common in Russia.

**balance.** (1) Originally, as applied to art, a rather broad and vague term denoting "a general harmony between the parts" (*Oxford Dictionary*), *repose,* or the special combination and arrangement of the parts of a work which was believed to be responsible for the impression of repose. Many of the specific meanings which the word acquired as the analysis of these arrangements progressed would have been discussed, if they had come up for discussion at all, under the topics of *contrast* and *proportion.* Its first specific application seems to have been to symmetrical figures. Fundamentally, the word *balance* suggests a gravitational equilibrium, and accordingly seems ideally applicable to any figure that is symmetrical with respect to its vertical axis. More remotely, it suggests a pair of opposites that complement each other so perfectly that the whole which they form seems complete and well-rounded; such pairs may be as arbitrary as straight lines and curves, verticals and horizontals, cold colors and warm colors, slow passages in music and rapid ones, or Shakespeare's clowns and tragic kings and still be recognized as constituting a balance, yet the ideal example is again the opposite halves of a symmetrical figure. But when this particular balance is analyzed it becomes obvious that it depends less on any innate difference between the two units involved than on their arrangement in space—and the whole field of equalities achieved primarily by means of arrangements in space is gradually recognized as the distinctive province of balance. Other names serve equally well for a mere opposition of qualities, or for qualities as general as harmony and repose, but here balance has few rivals. The word may of course be applied to a distribution in time, as in speaking of a song or a sentence that is built of balanced phrases, but distribution in space can be estimated so much more exactly and so many more equalities can be created within a given composition that it permits the creation of richer and subtler effects. The first decisive advance in our understanding of the subject was the realization that symmetry was not indispensable, since a satisfactory balance could be created with unequal and dissimilar units placed at unequal distances from the center of a composition. Progress was hampered, however, by two erroneous assumptions. The first was that symmetry and this balance of unequals were merely variant forms of a single phenomenon, which could be differentiated sufficiently as "formal" balance on the one hand and "asymmetric", "informal", "disguised", "subtle", or "occult" balance on the other. The second assumption was that, like balance in practical life, it was in all its forms essentially a gravitational phenomenon. A composition in which a large object near the center was balanced by a small one near the edge in the opposite half so inevitably suggested a seesaw, in which a large child sitting near the middle could be balanced by a small one at the end of the board that it was taken for granted that balance in a picture was an affair of the same sort. Writers spoke of the unequal "weights" of the balanced units and greatly overemphasized the slight discomfort of feeling that the "heavy" side of a composition that is not balanced is on the point of tipping downward. It was widely denied that there could be any other balance than balance across a vertical axis. Gradually, however, intimations of another ingredient in balance began to seep into the literature. Ethel Puffer wrote of the sort of excursions the eye preferred to make from the geometric center of a composition; other aestheticians spoke, more simply, of the different attractions which the units of a composition possessed for the eye of an observer and of the necessity for so distributing them that they will seem to balance each other; a few even recognized that a balance of this sort might be created across a diagonal axis, or possibly a horizontal one, as well as across a vertical one. Yet no one took the trouble to differentiate this newly discovered type of balance from the old; in nearly every discussion of the subject they were treated as, at most, alternative explanations of a single phenomenon, and remained intermingled as if in the strange confusion of a dream. Writers frequently began a paragraph in terms of one and ended it in terms of the other, without seeming to be fully conscious of the transition. It was not clearly realized that the attraction for the eye of any detail in a composition was equally effective in every direction, instead of merely across the center or across any axis whatsoever, and accordingly could be balanced in any direction; or that the frame, or other boundary, also created a set of attractions which must also be balanced; or that only a

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

continuous network of balanced units covering the whole area within the frame could satisfy all these requirements, and that formal balance across an axis must be attributed to other factors. Neither was it understood that even a perfectly symmetrical figure at the exact center of a picture, no matter how irreproachable its gravitational balance, might still be too small to create a satisfactory balance with the frame, or that a symmetrical figure contained two factors which differentiated it sharply from every irregular form of balance —the repetition of the *shape* of each half by the other and the purely visual equality between the distances of every pair of corresponding points from the axis of symmetry. DeWitt Parker recognized that the new nonaxial balance between visual attractions was something so different from balance in the old sense of the word that it needed a different name and suggested calling it *rhythm;* more recently, *equilibrium* (q.v.) has been suggested for the same purpose, but the problem still requires a great deal of analysis and experiment.

(2) In *architecture* the word balance, in addition to its usual meanings in the two dimensional arts, may refer to a balance of actual forces, such as the resistance of a column to the weight which it supports or the opposite thrusts of the two sides of an arch. In *dancing, to balance* is to take a few steps in one direction and then repeat them in the opposite direction, or it may refer to a pair, or a line, of dancers who approach each other and then withdraw. A *balancing position* is one in which a dancer stands on one leg with the other raised in a position that leaves him wholly free to choose his next step. The word is seldom used in connection with *sculpture,* either in the literature of the art or in the language of the studios.

(3) The adjective *balanced* is sometimes employed, like *harmonious, pleasing,* and similar words, as a casual term of praise for a work of art, with little or no intention of attributing to it any specific quality. —C.T.

(4) In *literary criticism* to indicate that in a work a proper respect is paid to all of the elements used. A work is balanced when each of its aspects receives due attention; it is unbalanced when some parts of the work are given a false emphasis. This distortion of balance may occur with reference to the subjects presented; or it may involve a sacrifice of form to meaning, of meaning to form, or of some of the values within these. —I.J.

**baldachin, baldaquin, baldacchino** (It., *Baldacco,* for the city of Baghdad, which was the center for the manufacture of a rich fabric of embroidered silk originally woven with a warp of gold thread; this fabric, *Baldacco* or Baghdad cloth, was preferred for the making of ceremonial canopies, the name of the cloth becoming associated with the canopy itself).

(1) A canopy of either permanent or temporary nature, stationary or portable.

(2a) A portable covering of decorative nature carried in ceremonial processions to protect and dignify distinguished individuals, treasured or sacred objects. The baldachin generally is supported by at least four poles carried by porters. It should not be confused with the ceremonial umbrella of the Orient; for example, see "Procession of *Corpus Domini*" by Gentile Bellini, Academy, Venice.

(2b) *Arch.* A stationary canopy of cloth over a dais or similar seat of a dignitary. The term sometimes is used in designating the canopy and curtains of a bed.

(2c) *Arch.* A fixed canopy, including its supports, of durable materials such as stone, marble, wood, or metal, built to shelter an altar (usually an isolated high altar) or sacred vessel. Baldachins of this nature are sometimes called tabernacles—example, Tabernacle of Or San Michele, Florence, by Andrea di Cione (Orcagna)—or ciboria—examples, S. M. in Trastevere, Rome, and Sant' Ambrogio, Milan. Many baldachins are elaborate in size and in use of materials, combining the art of sculptor, metalworker, and lapidarist; for example, that of the Cathedral of S. M. de los Angeles, Puebla, Mexico, and that of San Pietro in Vaticano, Rome, by G. L. Bernini, which measures approximately 95 ft. from the floor to the top of the finial cross. —J.C.

**ballabile, ballabili** (It. *ballare,* to dance). An evolution of a group or groups of dancers as climax to a scene, act or whole ballet as finale, when the entire company is merged into a collective moving mass, frequently executing a single repeated series of movements in unison immediately preceding a final held tableau. —L.K.

**ballad.** See song.

**ballad dances.** See chorovody.

**ballad opera.** An opera made up chiefly of folk songs, ballads, etc.

**ballade.** See MEDIEVAL MUSIC.

**ballata.** See MEDIEVAL MUSIC.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

**ball clay.** *Cer.* A clay with plasticity and binding power. See CERAMICS I.

**ballet** (It. *ballare,* to dance). The *ballate* were Tuscan dance-songs of the 13th and 14th cents. These *canzone a ballo* received the diminutive *balleti,* from which we derive "ballad" as well as "ballet". A ballet is a theatrical representation achieved by means and in terms of dancing. It has been recent practice to term any danced action as ballet. Strictly speaking, a ballet is a particular kind of lyric or non-realistic spectacle, making use of a vocabulary of dance movement, based on Italian social dancing of the Renaissance and later amplified and theatricalized from inter-European sources, until in the late seventeenth century it was codified in the French Academy. The terminology is traditionally French, and terms once applying to social dance forms now specifically refer to a stage idiom. —L.K.

**balletto.** (1) A ballet. (2) Name for an allegretto in 4/4 time (Bach).

**balletomane** (Fr., a ballet maniac or enthusiast). The ballet boasts an attendant body of devoted amateurs, like the *aficionado* of bull-fighting, the fan of baseball or boxing. These dispute the technical or personal qualifications of individual dancers, the merits of choreography and its specific performance. —L.K.

**ball flower.** A carved ornament common in decorated Gothic architecture in the form of a circular flower having a ball at the center.

**ball mill.** *Cer.* Mill with porcelain lining, using hard pebbles for grinding. See CERAMICS I.

**ballon** (Fr., balloon). The quality of spring, bounce or lightness in a dancer. *La danse ballonné* is a type of movement based on leaps and broad movement, covering considerable air and floor space. —L.K.

**balloon framing** (jocularly so-called because the buildings "go up so fast"). A simplified and practical western American type of framing for wooden buildings, mostly residences and stores of moderate size. The old *braced frame,* based on medieval traditions, was built up stage by stage, with elaborate mortise and tenon connections. This newer type was made possible in the 1830's by cheap nails for connections, and abundant saw-mill lumber (especially 2 x 4 or 6 inch studs in two-story lengths, 2 x 8 inch joists, and 1-inch sheathing boards). The exterior walls of a typical balloon frame are cellular, composed of vertical 2 x 4 inch studs which are set (about 16 inches center to center) upon a 4 x 6 inch *sill,* carry a notched-in *ledger board* at half-height to sustain the 2nd floor joists, and are capped by a 4 x 4 inch *plate* sustaining the rafters of the roof. Sill, plate, and corner studs (which must be stronger) are usually built up of 2-inch lumber. Interior walls are of 2 x 3 inch or 2 x 4 inch studs. Bridged openings receive door and window frames. The exterior sheathing, often applied diagonally, gives stiffness. This framing scheme, resulting in a notable economy of time, skilled labor, and materials, greatly facilitated the feverish growth of the western boom towns. The later *combination frame* incorporates bracing and other features of the braced frame; it is a further improvement, and is now in general use.

The earliest balloon frame building of note was the one-story shed-like St. Mary's, first church for Roman Catholics in Chicago (1833). Its builder was Augustine Deodat Taylor, from Hartford, Connecticut. Local tradition in Chicago ascribes the invention to the civil engineer and lumber dealer, George Washington Snow, from Keene, Vermont. Perhaps he worked out the typical 2-story scheme and/or as supplier, effectively spread knowledge of it. See Walker Field—A Re-examination of the Invention of the Balloon Frame, *Journal of the American Society of Architectural Historians,* vol. II, No. 4 (Oct. 1942), p. 3, and Voss and Henry, *Architectural Construction,* II, book I (New York, Wiley, 1926). —K.J.C.

**balsam.** A few of the varnish materials used by painters come under this name. Copaiba balsam—frequently an ingredient in varnish mixtures—Canada balsam, Venice turpentine, and Strasbourg turpentine are others. In general, a balsam is the resinous exudate from coniferous trees. From it, by distillation, the volatile oils like turpentine are derived and the residue, after distillation, is some kind of crude resin. —G.L.S.

**Baluba art.** See AFRICAN NEGRO ART.

**baluster shape.** Like the small pillar of a balustrade; swelling in the center or toward the base. A term applicable to many examples of Oriental ceramics. —J.A.M.

**balustrade.** A handrail, usually resting on a series of small pillars (balusters).

**bambino** (It.). Representation of the infant Christ.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

**bambocciade** (It.). A painting representing a grotesque scene from common or rustic life.

**bamboo.** See SYMBOLISM IN FAR EASTERN ART.

**bamboo painting.** See CHINESE ARTS.

**banana oil.** See amyl acetate.

**band.** *Mus.* (1). In the U.S.A., a group of ensemble performers upon wind and percussion instruments, as distinguished from an orchestra. *Military band* is such a band used by a regiment for marching or for concert purposes. *Brass band* is composed entirely of brass and percussion instruments; used for outdoor performance. (2) Hist., referred also to an orchestra or a chorus. —M.E.

**banded.** Term applied to masonry in which there are definite bands or courses of stones. More clearly described as random coursed or alternating coursed masonry. —J.M.M.

**banderole, banderol.** *Arch.* Frequent during the Renaissance. A sculptured band, often bearing an inscription.

**banisters.** See balustrade.

**banjo.** See MUSICAL INSTRUMENTS; AMERICAN NEGRO MUSIC.

**Bänkelsänger** (Ger., bench singer). Wandering minstrel who recounts romantic tales of adventure or history.

**Banko jaki** (Jap.). Pottery made in Ise province.

**Banmana art.** See AFRICAN NEGRO ART.

**banquette** (Fr. dim. of *banc*, bench). (1) Any bank, ledge, etc. (2) In southwestern archaeology: The term sometimes applied to the raised mass or ledge that is better known as the bench. —J.M.M.

**Baoulé art.** See AFRICAN NEGRO ART.

**bar** (or **bar line**). *Mus.* (1) A line drawn vertically across the staff, measuring the music metrically according to the time signature. (2) Illogically used for *measure*. See also HERALDRY; ACOUSTICS.

**barbican.** See castle.

**Barbizon school.** See FRENCH ART.

**barcarole, barcarolle.** (1) A boatman's song. (2) Any piece in imitation of the songs of Venetian gondoliers.

**barbotine.** *Cer.* A slip or clay paste used in relief decoration of coarse pottery.

**baren** (Jap.). A circular pad made of a braided mat covered with a bamboo sheath used to transfer the image by pressure and circular motion from block to paper in producing Japanese wood-block prints. —J.A.M.

**barium yellow.** This pale green pigment, known also as lemon yellow, is an artificial precipitate from neutral potassium chromate and barium chloride. As a pigment it is rather weak in color and rather translucent but has the advantage of being among the most stable of yellow coloring materials. It was developed during the first half of the 19th cent. —G.L.S.

**barking vibrato.** See VIBRATO.

**baroque.** From the Portuguese word "Barroco", meaning an irregularly shaped pearl. The term was used until the second part of the 19th cent. for "peculiar" and "overornate". It took a generation opposed to the classicist and rationalist theories of the first part of the 19th cent. and a matured notion of the genesis of styles before an understanding of the indigenous qualities of the post-Renaissance style called Baroque could be developed. This process of a transformation of a word of ridicule into one of a historically descriptive kind can be compared with the similar process the word "Gothic" underwent. We owe the elucidation of this style to Cornelius Gurlitt, Mâle, Woelfflin, Ricci, Dvorak, Sedlmayer, Weisbach and others. The term is used today for the art style of the period from about 1600 to 1720. If the *Rococo* which is really the last phase of the Baroque is included, the Baroque lasts until about 1760.

As far as form is concerned, Baroque in the Mediterranean countries appears as the organic outgrowth of the preceding Renaissance style. We call this development "organic" because it evolves features which can be likened to the "Baroque" elements in Hellenistic and late Roman art and which indicate that there exists a universal and natural tendency in the maturing of classical art styles to widen the scope of their expressive means and to enhance their language, until by mere evolution they have grown into a style in many ways opposed and contrary to their original concepts. It is therefore in our opinion not necessary to link the Baroque primarily to new spiritual concepts of the 16th cent. such as the Counter-Reformation (q.v.) but to see its basic stimulus in the maturing of pictorial and

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

plastic problems in the later works of the High Renaissance masters such as Raphael, Michelangelo, Titian, Correggio, Sebastiano del Piombo, etc. In their work the constituents of the coming Baroque appear as an outgrowth of purely aesthetic concepts such as the meaning of art as an illusion of natural and psychic reality which bears in itself a tendency toward the "illusionistic" style of the Baroque.

*Architecture.* The architectural archetypes such as cruciform churches, centralized churches, temple façades, etc., remain basically the same as in the Renaissance and so do the ornamental parts such as columns, pilasters, cartouches, etc., yet they are all used for an intensification of the optical and sensorial effects. Proportions grow in height or become heavier. The architectural parts are increasingly deprived of their independence and become subordinated to a major theme. Consequently, ground plans present a rich variation and complication of the basic traditional forms Inner and outer walls undulate in curves just as figures move flame-like in a "figura serpentinata" (Michelangelo's term). In becoming the instrument of the Jesuit Counter-Reformation (i.e. Gesù in Rome by Vignola, 568), the liturgical elements of the Catholic service are translated into dynamic visual symbols and the humanist restraint gives way to a fighting spirit which persuades, entices and seduces the devout. The exterior is conceived not only in context with its setting (previous centuries did this too) but in relation to its perspectivic appearance and its picturesque effects (Rome, St. Peter; St. Agnese in Piazza Navona). Façades are pulled together, buildings duplicated or multiplied in order to create the total effect (Rome, S. Carlo alle quattro fontane). Cupola and bell towers are merged closer with the body of the church and vitalize the contour of the building. Transitions from one part to another are organic and lend the impression of plastically moulded bodies. Ornamentation abounds, yet, in contrast to the late Renaissance, is not applied to a plane surface, but develops in form of plastic elements which emanate from the structural parts as an overflow of their dynamic energies.

In the interior all parts are used for the creation of one total effect. The longitudinal direction of the nave is received by the centralized and cupola-crowned transept. The old basilica scheme with side chapels all along the side naves has regained its old position. Monochrome treatment of the wall and its decorative elements changes to polychrome treatment. Surprising light effects, often from invisible sources of illumination, enrich the appearance and the mood of the interior. Marble columns and marble incrustation of the walls, stucco ornamentation and gilded wood carving on altars, confession chairs, etc. are treated in unison with sculpture and wall painting and tend toward the creation of one homogeneous picture to the eye of the observer. This means that the final effect is one of picturesque illusion rather than of intellectual demonstration as we find it in the previous Renaissance architecture.

The idea of the *Gesamtkunstwerk* (see universal artwork) shapes not only churches but also draws garden and palace together into one total effect (Versailles) and creates for the first time monumental solutions in city Planning (Rome; St. Peter's Square; Piazza del Popolo; Paris: Tuilleries; Bath: Crescent). Palaces expand to the size of castles indicating the growing importance and wealth of aristocracy in the dynastic organization of Europe in the 17th and 18th cent. London, Vienna, Prague, Madrid furnish a wealth of examples. Palace and castle both renounce the last traces of defensive buildings and open their walls with rows of windows, interspaced with balconies, thus changing austerity of appearance to urbanity and elegance. The dwellings of the citizen class follow on a more modest scale the example of palatial architecture and abound in picturesque solutions of the treatment of façades and roofs. Bridges, staircases, fountains, monuments help to create a consciously planned setting or an instinctively blended organism as we find it in Rome and Prague at its best.

The Baroque style in architecture originated in Rome stimulated by Michelangelo's three-dimensional plastic treatment of architecture to be seen in the choir and the cupola of St. Peter's. Galeazzo Alessis' (1512-1572) Bolognese palaces and Andrea Palladio's (1508-1580) building activity in Vicenza and Venice also contribute toward the maturing of Baroque architecture. Borromini (1599-1667) and Bernini (1598-1680), created the pompous and magnificent language of the Roman Baroque which spread all over Europe yet in France and England was counteracted by a tendency for classicist solutions (Paris, Louvre, where Bernini lost the competition against the classicist Perrault in 1665). On the other hand, Spain welcomed the Roman Baroque in accordance with its native tendency for ornateness and transplanted it into its American Colonial empire, thus making the Baroque the

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

true architectonic European style in the New World. The Catholic countries of Central Europe (Bavaria, Bohemia, Austria) transformed the Italian style into an idiom of their own which surpasses the Roman Baroque in creative ingenuity. Especially in its latest phase, the *Rococo,* Central Europe contributed the subtlest solutions in the field of ecclesiastic and secular architecture. From the treatment of entire city units as in Nancy or Potsdam to the operatic intimacy of royal amusement places (Munich, Residenztheater, ca. 1730), the Catholic world conceived here for the last time an expression for its concepts embodied in the celestial and the secular hierarchy. Church and Court found the perfect vehicle for the symbolization of power, glory, divine installation and stratified organization in the Baroque style.

*Sculpture.* Baroque sculpture, created in the period between 1600 and 1750, is characterized by dynamic motion of body and garment, by an opening and splitting of contour, by an undulating fluency of all forms, by a richly concave and convex treatment of surface which admits light and shadow as an active factor in the total effect. Subordination to a larger architectonic unit such as an altar, a wall or a monument often determines the shape and the color scheme of statuary. Excellency of technical skill is growing together with the neglect for the indigenous laws of material, as typical of any illusionistic style. Wood is treated like marble, marble transcends the laws of gravity and stands for draperies or painted canvas. The new tasks such as large monuments and fountains create an awareness of distant optical effects but also a neglect for the subtle treatment of details.

Italian Baroque sculpture, prepared by the classicist ornateness of Florentine mannerism (Cellini, 1500-1571), by the massive exaggerations of the Michelangelo imitators (Ammanati, 1511-1592) and the courtly elegance of the French-Spanish-Italian school (Giovanni da Bologna, really Jean Boulogne, 1528-1608), came into its own in the extensive work of Lorenzo Bernini, previously mentioned as an architect. A stream of vitality emanates from his portrait busts (Louis XIV, Constanza Buonarelli, Urban VIII), from the active incorporation of water power in his Roman fountains (Triton fountain, fountains in Piazza Navona) and from his monuments which range from the delicate (St. Theresa in St. Maria della Vittoria) to the gigantic (Cathedra Petri in St. Peter's). His influence has helped to transform the sculptural style of Europe. Allegorical womanhood and the army of winged celestial messengers bloomed with new health and gaiety while in the field of equestrian monuments and portrait busts Bernini's manner became universal for the remainder of the 17th cent.

Spanish sculpture excelled in the Baroque period through its genuine blend of sensualism and mysticism which it derived partially from the influence of Italian Renaissance sculpture. The cunning use of polychromatic treatment enhanced its "naturalness" to the expression of ecstatic suffering and transcendental languor. Painters such as Francisco Pacheco (1571-1654) lent their art to the creation of the life-like surface of Sevillian sculpture. Gregorio Hernandez (1576-1636) represents the School of Valladolid, while Sevilla excells in the work of Juan Martinez Montañes (1568-1649) and his son Alonso (d. 1668). His student, Pedro de Mena (1628-1688) carries the highly emotional style to be compared with El Greco's mystical interpretations to the end of the century.

In Germany and Austria, the Baroque sculpture takes up many of the formal and emotional elements which this art had produced in the days of the late Gothic. Nowhere else around 1500 had sculpture reached a point of development so close to the Baroque spirit than in the statuary of Bavaria and Austria (cf. Hans Leinberger). Giovanni da Bologna's style was introduced into Southern Germany through a number of Flemish and Dutch students of his (Hubert Gerhard, Adriaen de Vries, Pieter de Witte, called Candido) and fused in the next generation with the native late Gothic undercurrent. In Andreas Schlueter (1664-1714) from Hamburg, Germany gave to the Northern world its greatest Baroque sculptor. In the south, Balthasar Permoser (1651-1733) developed Bernini's style toward the exuberant mobility of the Rococo. It is in this latest phase of the Baroque, the Rococo (1720-1770), that the Catholic and dynastic world of Southern Germany and Austria produced a host of excellent sculptors and an unmistakable style of its own. The creation of porcelain sculpture by Johann Kaendler (1706-1775) may be mentioned as an example of the transfer of the highly plastic feeling of the Baroque into a new medium.

French sculpture remained throughout the 17th cent. more in the line of its classical-Renaissance taste and contributed, accordingly, little to the history of the Baroque proper. It is with François Girardon (1628-1715) and Pierre Legros (1666-1717) that Bernini's style

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

enters French sculpture. While Coysevox (1640-1720) and Coustou (1658-1733) represent the style of Louis XIV's court, Pierre Puget (1622-1694) follows his independent genius in the direction of an exploring yet monumental naturalism. The first part of the 18th cent. unites classicism with Baroque sensualism in the erotic-mythological genre of Bouchardon (1698-1762) and Falconet (1716-1791) which had a widespread influence on 18th century sculpture.

*Painting.* Out of three main components Baroque painting developed: the chiaroscuro style of Leonardo, the coloristic sensualism of Titian, the plastic dynamism of Michelangelo. In Correggio (1494-1534), a step beyond Leonardo toward the Baroque is made while in Tintoretto (1518-1594) a fusion of Titian's style with Michelangelo's was aspired and thus a further advancement of Baroque elements is achieved. All Northern and Spanish masters of the same period partake directly or indirectly in the same process of the Italian evolution. This evolution is one toward dramatization of composition, color and content. The *dramatization of composition* replaces Renaissance symmetry by asymmetrical balance and the horizontal and vertical scheme by a curvilinear fluency of forms. As in architecture, space becomes activated by the exaggeration of body foreshortening, by dramatic light and shadow movement and finally, by making space itself the primary motive of a painting's composition and mood. The *dramatization of color* expresses itself by a change from cool to warm colors, by a tendency toward the blending and modelling of colors into hues instead of the localized color application and by the introduction of black and earth colors as the sonorous undertones from which to develop contrasting brilliancy. Accordingly, we observe a tendency to proceed gradually from the dark into the light, a process just the reverse of all previous painting. The *dramatization of content* bespeaks itself in an intensified apparatus of gestures and facial expressions reflecting a wider perception of sensorial experiences. The scale from horror to ecstasy is explored in Mediterranean art while the North delves into the unfathomable nuances of sustained psychic life. The appeal to the onlooker becomes more and more direct and new means are constantly invented to break down the "aesthetic barrier" between onlooker and art work. New fields of subject matter are opened up such as historical painting, the erotic genre, the allegory, the still-life and, most important of all, landscape painting.

As to the practical application of painting, its scope also becomes widened: fresco painting extends from the walls to the ceilings which open the space into an allegorically and religiously animated heaven and into the field of stage prospectus, inviting the architectonic-picturesque imagination. Costume designs, pageants and festivals remain as in previous periods a welcome field for the artist.

All these characteristics of Baroque painting appear full fledged in the exponents of the Bolognese Baroque art: Agostino Caracci (1557-1602) and his brother Annibale (1560-1609), Domenichino (1581-1641), and Guercino (1591-1666). Guido Reni (1575-1642), Carlo Dolci (1616-1686) and Maratta (1625-1713) continue their style and sensualize it to its extreme. For more than a hundred years the pictures of these painters and their innumerable students and followers set the standards in the history of taste and accordingly are represented everywhere in the dynastic galleries of Europe. Equally important is Michelangelo da Caravaggio (1565-1609), whose stark realism exerted a profound influence on Italian, French and Dutch painting. The illusionistic fresco painting of Cortona (1596-1669) and Pozzo (1642-1709) caused the introduction of celestial panoramas with daring foreshortening and uproarious agitation in monumental architecture all over Europe. Closely related with it are the imaginative stage designs by Ferdinando (1657-1743) and Francesco Bibiena (1659-1739). Salvator Rosa (1615-1673) and Magnasco (1681-1747) excel in the new Baroque landscape art with an atmosphere of operatic Romanticism. In the 18th cent., Venice makes its great contribution in the immense production of the painter families Tiepolo (Giovanni Battista, 1696-1770) and Canaletto (Antonio C., 1697-1768), spreading their works in fresco and canvas over the continent while Piazetta (1682-1754), Longhi (1702-1762) and Guardi (1712-1793) carry the local Venetian note to its last flowering.

While Italian painting of the 17th and 18th cents. represent the virtuosity and the sensualism of a super-mature and slowly declining civilization, Flemish and Dutch art of this period stand for the maturing of all artistic problems prepared in the previous two centuries and for the ripening of the Protestant burgher civilization of Holland. The course of the art is determined by two great names: Rubens (1577-1640), who stands for the healthy and abundant Flemish Catholic country evolving his style out of a blend of native realism and Italian plasticity. The other is

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

Rembrandt (1606-1669), exponent of Holland's Protestant humanism, blending the local tradition with the notions of the Caravaggio school. In contrast to the prevailingly religious type of Italian Baroque painting, these two masters are exponents of the general trend of their civilization toward secular motives, expressed particularly in portraiture and landscape. In addition to Rubens and Rembrandt, there are the great landscape painters Jakob van Ruysdael (1628/29-1682) and Hobbema (1638-1709), accompanied by a flock of respectable secondary painters. A new type depicting interiors of rooms and courtyards with homely scenes finds its master in Vermeer (1632-1675), Pietre de Hooch (1629- after 1677) and Terborch (1617-1681). All of them are equally excellent in the field of portraiture and are joined by the brilliant Frans Hals (1582-1666), who develops tonality painting and preciousness of color quality to an unheard of level. Another specialty is the peasant genre in which Adriaen van Ostade (1610-1685), Jan Steen (1626-1679), and the Flemish artist Adriaen Brouwer (1605/6-1638) continue the Breughel tradition. Never again has a small nation produced a correspondingly large number of painters and rarely has there been achieved a similarly "visual" civilization.

The Spanish also see their greatest period in Baroque painting. Realism and mysticism determine its character. Religious subject matter embodies both these currents. In the art of Greco (really Domenico Theotocopuli from Crete, 1541-1613), ecstatic mysticism achieves its most ingenious representation while realism determines the work of Velasquez (1599-1660). Ribera (1588-1653), Zurbaran (1598-1664) and Murillo (1618-1682) embrace the entire range from the one to the other. While Greco's palette produced all means of a spiritualized Venetian luminosity, the other masters teach to later centuries the use of passive earth colors such as black, brown and grey in their maximum strength. The peasant and beggar genre, portraiture and religious art with an emphasis on the sombre and cruel prevail throughout.

French Baroque painting contributes two painters of international importance: Poussin (1593-1666), the master of the mythological and Claude Lorrain (1600-1682), the landscape painter. Yet as in architecture, the Baroque elements in French painting are more strongly interwoven with classicist doctrines. The brothers Le Nain (Antoine, 1588-1648; Louis, 1593-1648; Mathieu, 1607-1677) may be considered as the closest to the Dutch and Spanish realists of this period. In the Rococo period French painting exerted its most widespread influence over Europe, being blessed with such gracious masters as Watteau (1684-1721), Boucher (1703-1770) and Fragonard (1732-1806). The vital substance of the Baroque era now begins to dissolve in the playful sophistication of a late aristocratic society.

At the same time in the late epoch of the history of the Baroque style, England produces its able and elegant society painter Gainsborough (1727-1788) and its deft satirist Hogarth (1697-1764), both of whom already reach out into a new era.

Germany in the 17th cent., perhaps under the influence of the 30 Years War, produced very few artists of more than local importance. Only Elsheimer (1578-1610), admired by Rembrandt, contributes his delicate romanticism to the field of landscape painting. The Catholic South, under the guidance of the Italian frescoists brought forth a large number of capable but superficial fresco masters active within the extensive building program of palatial and ecclesiastic architecture.

As a special field of artistic expression in this era we must consider the creation of the architectonic *Baroque garden* with its "parterres" of flowers, its symmetrically designed alleys with grand perspectivic effects and its dramatic use of cascades, fountains and canals. As a forerunner, the garden of the Villa d'Este in Tivoli (since 1549 by Pirro Ligorio) and as the mature solution Le Notre's (1613-1700) garden of Versailles (since 1661) set an international pattern for the Baroque garden. It subordinated nature under man's architectonic will and aimed for a total effect of wide distances presented in systematized spatial arrangements. In many ways, the Baroque garden appears as the most outspoken symbol of the entire epoch: dynastic will for space conquest, the tendency of the era for illusionistic deception, the strong sense for architectural and plastic form and life, the tendency for organized social life even in the out of doors, all these elements seem embodied in the Baroque garden. **barrel shape.** Like a barrel, its height greater than its breadth, bulbous in the center and tapering equally toward each end.

**barrel vault.** A vault which, in section, is semicircular.

**barrow.** A tumulus.

**baryta water.** See fresco secco.

**base** (Fr. *base,* L. *basis,* Gr. *basis,* a step, base or pedestal). In architecture the lowermost member of a column, consisting of a plinth and mouldings between the shaft and the pavement or between the shaft of a column or pilaster and the pedestal on which it rests. In primitive Egyptian and Greek architecture the base was a raised slab of stone or cement whose function was to insulate the timber column resting upon it from ground moisture; when stone replaced wood for columns this simple base was retained, probably because its greater area gave increased stability. Each of the Greek orders, with the exception of the Doric in which the base was abandoned, developed a characteristic base in which the profiles varied by different proportions and combinations of torus and scotia mouldings and fillets. Common to all the Roman orders is an adapted Greek design known as the Attic base. In each of the Greek orders the base is round, and this practice was followed by the Romans, but frequently in Romanesque and Gothic work the roundness is modified by the addition of decorative spurs or *griffes* at the corners of the square dies to enrich the transition from round shaft to square plinth. Bases composed of elaborate mouldings appeared at an early date and are frequent in Assyrian and Persian architecture as well as in the classic styles. Base is also properly used to describe the plinth and mouldings which project at the bottom of the wall of a room or a church, and the lowermost course of masonry in a building; from Renaissance usage base is also used interchangeably with pedestal. (For profiles of the classic bases see ORDERS). Also see PERSPECTIVE. —T.A.H.

**base line.** See PERSPECTIVE.

**base of cones of rays.** See PERSPECTIVE.

**basic series.** See twelve-tone technique.

**basilica.** *Rom. arch.* An oblong public building used for exchange or assembly, built with nave and aisles; an early Christian church building of similar form. See EARLY CHRISTIAN ARCHITECTURE.

**Basket Makers.** See Pueblo art.

**bat.** See SYMBOLISM IN FAR EASTERN ART.

**batik** (Malay.). Fabrics decorated by the *batik* technique, which is a resist process. Parts, which are not to be dyed, are impregnated with wax. The fabric is then dipped in color and finally boiled to remove the wax. Repeated as many times as there are colors. See rogata-zome. —J.A.M.

**batiste.** Plain weave cotton or linen cloth.

**bats.** *Cer.* Shelving in decorating kiln; made of cast iron. See CERAMICS I.

**battement.** *Mus.* An old grace which in contrast to most other historic ornaments has no proper sign of its own. The battement consists of a shake starting on the auxiliary half-tone below the principal note. —F.D.

**batter.** Term applied to a wall that inclines inward from a vertical or plumb line.

**battle dress.** See COSTUME ART.

**battle piece.** Any work of art representing a battle.

**Bauhaus.** A German educational institution and research center for the training of architects, artists, industrial designers, etc. The Bauhaus was founded in 1919 by Walter Gropius in Weimar (as *Das Staatliche Bauhaus Weimar*), transferred to Dessau in 1925 and closed by the Hitler party in 1932.

The Bauhaus maintains that the separation of architecture, the so-called fine arts, applied arts, etc., from one another is a fundamental and dangerous error All these fields are different aspects of man's creative artistic ability, the ultimate goal of which should be "the composite but inseparable work of art, the great building" (Gropius). The Bauhaus therefore abolished the separations held to be artificial, and integrated the teaching and exploration of the various fields, taking building (*bauen*) as its basis, (hence the name *Bau* house). The teaching of the various aspects of art was supplemented by the study of related subjects (e.g. biology, sociology, accounting, etc.).

Since creative ability, according to the Bauhaus, is an integral part of life, an educational institution concerned with the development of such abilities must make the student aware of the forces which determine his age and hence his life (i.e. industry), and train the student so that his knowledge and abilities may best serve and express the true needs of his time. However, this program should not be understood as a complete subordination of architecture and the arts to the forces of industry and economics. While the Bauhaus is opposed to an "art for art's sake", it is equally opposed to the acceptance of industry as an aim in itself. In the integrated new culture which the Bauhaus envisages these two spheres influence each other mutually. The new conception of architecture and the arts ultimately implies a change in the social-cultural structure (and in many respects the products of the Bauhaus express a social ideal which is yet to be realized).

The integration of a harmoniously unified architecture and art into the contemporary culture has as a correlate, of course, the integration of the individual. This entails a general and a particular educational aim. The general aim would be: to make the student comprehend life as an integrated whole; the particular aim (concerning his professional training): to develop both the student's creative imagination and his technical proficiency. In order to achieve this aim the Bauhaus curriculum combined manual and intellectual training.

The manual training in the workshops was not intended to advocate a sentimental revival of handicraft, but was designed to serve as an introduction to industrial processes. The workshops of the Bauhaus were actually laboratories in which new designs for mass production were evolved. Since the advanced students also worked in factories which produced objects designed in the Bauhaus a close contact between the workshops and industrial production was maintained (while working in a factory the students studied all aspects of production, from actual work with the machines to price calculation).

The Bauhaus did not try to formulate a new "style" or a set of rules which could be handed down to the students. Its aim was rather to train students to understand new needs and to create objects which truly express and satisfy such needs.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

As the result of its program and viewpoint the Bauhaus exerted a decisive influence on the formation of the modern style and became its center in Europe. It was but a logical extension of its basic ideas that the Bauhaus was international in character, accepting influences from all parts of the world, and in turn extending its influence beyond the boundaries of Germany. See GERMAN ART; functional architecture; also Walter Gropius, *Idee und Aufbau des Staatlichen Bauhauses Weimar,* 1923 and *The New Architecture and the Bauhaus,* 1937. —H.H.

**Bautasteinar.** See rune.

**bay.** *Arch.* (1) The principal compartment or division, as in a roof or ceiling, consisting of the space between rafters or beams. (2) The space between any two architectural features. —J.M.M.

**Bayake art.** See AFRICAN NEGRO ART.

**bazaar.** See ISLAMIC ART.

**bead.** A small molding having a rounded surface often carved with bead like forms alternating with another motif as in the Greek and Roman bead and reel. —O.M.S.

**bead and reel ornament.** Single or paired oblong beads or "olives" alternating with disks, all on a round convex molding.

**beaker shape.** Like a beaker. A cylindrical form narrowed in the center and flaring at both ends or flaring at the top only.—J.A.M.

**beakhead.** A Norman ornament having the form of a head with a beak.

**beam.** A long horizontal piece of wood, stone, or other material forming part of the frame of a building or other structure.

**bearing.** *Arch.* The part of a beam or other structural feature that rests upon a support.

**beating up.** Striking each warp thread into its appointed position.

**beat.** *Mus.* (1) Metric unit indicated by the time signature, e.g., ¾ time calls for three beats to the measure, the quarter note receiving one beat. (2) To express physically the unit divisions of the measure. (3) Acoustically, the throb heard when two tones of unsympathetic vibration numbers reach a point of coincidence. See ACOUSTICS. —M.E.

**beauty.** The quality of the "beautiful", ascribed to objects of aesthetic experience, is familiar to everybody. But the understanding of 'beauty' has proved to be exceedingly difficult. It is generally agreed that it is a value, primarily aesthetic insofar as it is enjoyed in its specific manifestations, and secondarily educational insofar as it is worth studying and also cultural insofar as it constitutes a vital phase of social progress. It is agreed also that beauty has a prominent subjective aspect, first, because aesthetic experience is always in a sense personal, and second, because persons contemplating a beautiful object are likely to contribute to it something of their own. But the objective aspect of beautiful objects has largely remained a puzzle or mystery. Some aestheticians are inclined to deny its very existence, while others assert that beauty is inherent in, or dependent on, the objects of aesthetic experience themselves; a few even maintain, following Plato, that beauty has a transcendent existence in which it coincides with the True and the Good. The puzzle is so profound that Kant came to regard it as an antinomy, or a contradiction that has to be nevertheless accepted.

It is possible, however, that the difficulty to comprehend 'beauty' is largely verbal. The term is, in fact, highly ambiguous in its use for three reasons: (1) Beauty is a matter of taste and opinion, and men disagree on what is beautiful and what is not; moreover, the experience is transient, and what is regarded as beautiful at one period of a person's life may not be so regarded at another. (2) Beauty, as an experience, throws little light on beauty, as a concept, with the result that persons who agree on what objects produce aesthetic experience may utterly disagree on its conceptual meaning. (3) Beauty applies to a vast field of aesthetic experience, including the beauty of nature and the beauty of art, though these two kinds of beauty have similar as well as dissimilar characteristics.

Among the characteristics which the beauty of nature and the beauty of art have in common are: (1) Beauty is ascribed in both cases, to external objects; e.g. when we admire flowers or paintings, we feel that it belongs to these objects rather than to our taste. (2) Beauty thus becomes an objective (or objectified) quality rather than a quality of our own experience. (3) The value of beauty, in both cases, can be enjoyed by more than one person, and thus differs from other values, such as those of physical pleasure or economic opportunity, which diminish when

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

shared; in other words, an aesthetic experience is not directly affected by the number of participants.

Among the characteristics in which the beauty of nature and the beauty of art differ are: (1) Art is man-made, a product of man's creative ability, whereas nature on the whole is not; as a result, art embodies and expresses human feelings, desires and ideas to a much greater extent than nature. (2) Whereas the beauty of nature is necessarily pleasing, once it is experienced, art may take for its subject matter happiness or misery, the good or the evil, the sublime or the ugly, and thus cause pleasure or displeasure.

The latter distinctions make us conclude that the field of art, real and potential, is vaster than is usually supposed. Its subject matter may concern virtually everything in reality and social life, more or less modified by imagination, provided it is endowed, through an adequate use of artistic technique, with a message capable of arousing aesthetic feelings in those susceptible to it. Apart from certain purely psychological demands for a vicarious pleasure and satisfaction or fiction, the ultimate function of art appears to consist in freeing men from whatever self-imposed limitations they happen to possess; in refining and sharpening their sympathetic understanding of fellow-men; and in making the progress of mankind a matter of sensitive heart no less than that of thoughtful head and powerful muscle. See AESTHETICS; also Winn, R. B., The Beauty of Nature and Art, *Journal of Aesthetics and Art Criticism,* Spring, 1942; Dewey, John, *Art as Experience,* 1934; Gilbert, K. E., and Kuhn, H., *A History of Esthetics,* 1939; Parker, De W. H., *The Principles of Aesthetics,* 1920; Santayana, George, *Sense of Beauty,* 1896; Tolstoy, L. N., *What Is Art?* 1929. —R.B.W.

**Beauvais ware.** See CERAMICS II.

**bed.** In masonry: (1) A layer of mortar in which stones or bricks are to be laid. (2) A horizontal course of a stone wall. (3) The lower horizontal surface on which the stone rests. See FURNITURE. —J.M.M.

**Bedford cord.** A vertically ribbed cloth of great strength. First made in New Bedford, Mass., hence the name. A similar material in cotton which originated in France is called pique. —G.W.R.

**beeswax.** Used now largely as a modelling and coating substance, this wax has been also a painting medium. Among pictures in which it served that purpose, the so-called Fayum portraits—a group of mummy paintings—is probably the largest. Unwieldy, except perhaps in full tropical sunlight, it has the great advantage of stability. See also waxes.—G.L.S.

**beige.** Natural tan or ecru color; or undyed yarn or fabric.

**bel canto** (It.). Literally, beautiful song. The lyric style of singing as opposed to the declamatory or dramatic style.

**bell.** See MUSICAL INSTRUMENTS.

**bell capital.** See capital.

**bell crater.** See crater.

**Belleek china.** See CERAMICS II.

**bell-shape.** The form of a common hand-bell.

**Bema.** See synagogues.

**bench.** In southwestern archaeology: A mass of material, generally adobe or masonry, elevated above the floor of a chamber or given level; the top being more than twelve inches but not over three feet six inches above the floor or level; the top being at least twelve inches in width. —J.M.M.

**bench nook.** In southwestern archaeology: Term applied to a recessed portion of the bench, as in a kiva. —J.M.M.

**bench singer.** See Bankelsanger.

**bend.** See HERALDRY.

**Ben Day process.** *Etch.* Method of producing by machine a stippled, mottled, or shaded background on a line plate.

**bend sinister.** See HERALDRY.

**benedictus.** See Mass.

**Bengal indigo.** See indigo.

**bengaline.** A corded fabric, heavier than poplin, made of silk, silk and wool, or silk and cotton. Rayon may be substitute for silk. —G.W.R.

**Benham's discs.** See COLOR.

**beni** (Jap.). A color designated as rose-red, used on early Japanese prints.

**beni-e** (Jap.). Early woodblock prints in which single coloring was added by hand to

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

a black and white impression. The name was derived from *beni* (a rose-red pigment), which predominated. —J.A.M.

**Benin art.** See AFRICAN NEGRO ART.

**beni-zuri-e** (Jap.). Woodblock prints in which red (*beni*) was prominent. The colors in *beni-zuri-e* were printed, whereas the earlier *beni-e* (q.v.) were colored by hand. —J.A.M.

**benzoin.** A dark gum or resin from trees native to Siam and Sumatra, benzoin is occasionally put into varnishes and lacquers to make them less brittle. It is mentioned in various manuscripts of mediaeval origin. —G.L.S.

**berceuse.** A cradle song, lullaby.

**Berlin blue.** See Prussian blue.

**Bes.** *Egypt. Relig.* A god of many attributes but worshipped chiefly as a deity who warded off evil omens and witchcraft; god of pleasure.

**bestiary.** Medieval book on zoology reporting habits of animals, real and legendary and interpreting them as "symbols" of Christian verities, exceptionally of amorous pursuits (*bestiare d'amour*). Often illustrated and as such the source of motives in church decoration. Derived from the so-called "Physiologus" (q.v.). —R.B.

**Betatakin** (Navaho, hillside house). An Anasazi cliff village built in a large cavern in the Laguna (or Segi) Canyon in north central Arizona. The houses and kivas, about 150 in number, are of stone and adobe or of adobe-covered poles. It is now part of the Navaho National Monument. See Pueblo art. —H.G.

**betterments.** See CIVIC PLANNING.

**bhadana, bandhana.** Kerchief for the head or neck; originated in India, where *bandhu* or *bandh* referred to a cord or tie. —G.W.R.

**bhūmisparśa mudrā** (Skr.). Mystic gesture symbolizing the right to call the earth to witness Buddha's power. Right hand extending downward over knee, palm inward, fingers extended, generally touching the lotus throne. —J.A.M.

**bibelot.** *Book.* A small book, usually a curiosity.

**Bicheroux process.** See GLASS AND GLASS MAKING.

**Bidri ware.** See metalwork.

**Biedermeier.** A phase of German art (ca. 1830 - ca. 1860) following Romanticism. The name *Biedermeier* originally referred to a type of philistine—cheerful and honest, but limited in outlook. The term was invented by Eichrodt and Kuszmaul who, enjoying the unintentional humour of some poems of a village schoolmaster, published them (1855-1857) in the *Fliegende Blätter* (a humorous weekly) under the title, *Gesänge Biedermaiers* (Biedermaier's Songs, [the "ai" was later changed into "ei"]). The fictitious name then was applied generally to all sorts of philistine weaknesses and characteristics. Later *Biedermeier,* (losing its ironical connotations), was adopted as the name of the period, which is characterized, at least externally, by a dominance of sober orderliness and simple pleasures. The furniture and interior decorations clearly reflect this spirit which transformed the Empire style into a style of sober severity and simple usefulness.

In connection with the visual arts *Biedermeier* style is, in a sense, a reaction—although a mild one—to the later part of the Romantic period, replacing the historical, religious, and symbolic themes of that period by scenes from the every-day life of the "simple" peasant and of middle-class society. The forms of nature—plant, animal, human—are studied with loving care, and simplicity is depicted as a virtue found in nature and among those who are content with simple pleasures (e.g. the paintings of C. J. Milde, E. Engert, Karl Spitzweg). And yet this simplicity is artificial and sentimental; it is imported into nature. The peasants in G. F. Waldmüller's landscapes, for instance, are presented as neat and clean; in their picturesque costumes they move about in landscapes which are equally neat and clean. The drawings and paintings of Ludwig Richter and Moritz von Schwind have the appealing and sentimental qualities of folk-songs. Karl Spitzweg, J. P. Hasenclever, Th. Hosemann expose the weaknesses of their *Biedermeier* contemporaries with a gently ironic humour; the objects of their humour are mild eccentrics, e.g. slightly queer collectors of books or cacti who live contentedly within their own small circle oblivious to what happens in the outside world.

When the preoccupation with sentimental themes is abandoned, as in the numberless landscapes of Gensler, Blechen, Spitzweg, Rottmann, Pettenkofer, Lessing, Preller, Achenbach and many others, there result charming and intimate studies of parts of nature

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

apparently done without an effort at composition or arrangement. Since, according to these artists, nature is best when not interfered with or spoiled by man, they avoided artistic composition trying to give nature as it really is. However, the scenes are carefully selected so as to reflect the sentiment which the artist wants to express—sunny clearings, pleasant and inviting valleys, gently rolling hills, etc. —the artistic composition is replaced by the picturesque motif.

The romantic historical narrative is continued in the paintings of Kaulbach, Rethel and Hildebrand. The meticulous care in the presentation of all objects and figures and the sentimental interest taken not only in the hero of the scene but also in minor figures (e.g. the paintings of Franz Krüger) tends to make the historical presentation anecdotal. In the art of Adolf Menzel this type of historical painting reaches its climax. Menzel, in whom the romantic interest in and love for nature finds expression in an almost fanatically realistic naturalism, combines great veracity in the historical details with the ability of binding together all the details into one unified composition while maintaining an air of the accidental.

The *Heimat Kunst* (regional art) of the turn of the century may be considered a late offspring of the *Biedermeier* art. Living in artist colonies (e.g. Worpswede, North Germany; Dachau, Bavaria; Willingshausen, Hessia) the *Heimat Künstler* paint peasants at work, peasants dancing, etc., in the *Biedermeier* manner with a technique which is strongly influenced by the impressionists. See GERMAN ART; FURNITURE; also Richard Hamann, *Die deutsche Malerei im 19. Jahrhundert,* 1914; Jos. Aug. Lux, *Von der Empire zur Biedermeierzeit,* 1906; Paul Ferdinand Schmidt, *Biedermeier Malerei,* 1923 (2nd ed.). —H.H.

**billet-molding.** A Norman molding ornamented with short cylinders or prisms usually in a double row with regular spacing between the ends. —O.M.S.

**Bima** (Heb.). See synagogues.

**binder's stamp.** *Book.* A design engraved in brass for stamping decorations and titles on covers.

**binding medium.** Any adhesive material put with pigment to hold it together in a film can be called by this name. It is sometimes confused with a diluent or solvent used to thin the adhesive, as water is used with gum arabic and glue or as turpentine is used with oil. These diluents are not painting mediums but serve only as temporary thinners There has been no standard classification of mediums as such, but practice has separated out oil, tempera—which frequently is extended to include all adhesives that are soluble in water at the time of application—and waxes.—G.L.S.

**biotechnical elements of construction, the.** See SCULPTURE.

**bird sanctuary.** A tract of land esp. reserved for the attraction and protection, under natural conditions, of wild birds. See CIVIC PLANNING.

**Birūik art.** See ESKIMO ART.

**biscuit, bisque.** Unglazed fired clay ware; the first firing or burning, converts dry, fragile clay into a hard, consolidated mass, generally used for clay products to be glazed (second firing). See CERAMICS I.

**biscuit groups.** See CERAMICS II.

**biscuit kiln.** *Cer.* For firing bisque. See CERAMICS I.

**bistre.** This, like asphaltum, is a tarry material and is derived from the soot of burned resinous wood. The color ranges from orange-yellow to brown-black, depending on the material and the method of manufacture. Unlike asphaltum, this can be readily used with water-soluble mediums. Though it has the drawback of being relatively unstable, it has been used largely for drawing since the 14th cent. It is still sold by artists' colormen. —G.L.S.

**biting.** *Etch.* Process of corroding or etching sections of a metal plate to form a design for intaglio printing. See line etching.

**bitstone.** *Cer.* Quartz rock grains for placing ware on bottom of glossed saggers. See CERAMICS I.

**bitumen.** See asphaltum.

**biwa.** See MUSICAL INSTRUMENTS.

**Bizen yaki** (Jap.). Pottery made in Bizen province.

**blackface comedy and minstrelsy.** See AMERICAN NEGRO THEATRE.

**black-figured vases.** During the first three-quarters of the sixth century B.C. the char-

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

acteristic technique of Greek vase painters was black-figured, i.e., figures painted in black glaze silhouette on the terra-cotta background, with details of body and drapery incised in the glaze by a sharp metal tool. Sometimes the flesh of women was painted in white, and purple was used to vary the folds of the garments. Black-figured vases may conveniently be divided into two groups: (1) those made in Greek Asia Minor and the nearby islands, which show in their use of floral and heraldic designs a strong Oriental influence( see Ionian Vases); (2) those made in Greece proper, which emphasized human scenes, chiefly mythological. Of this second group the chief products were "Proto-Corinthian" (Sicyonian?), notable for their delicate shapes and polychrome designs; Corinthian, patterned after the Proto-Corinthian, but coarser in shape and decoration; Chalcidian, elegant and precise in form, with spirited scenes pictured on the sides; and Attic. It was in Attica that the black-figured style reached its highest point; previous shapes were refined and new ones invented; abstract decoration was confined to marking transitions, and emphasis was put on main friezes or panels, depicting with disciplined skill and vigorous energy scenes from heroic legend or everyday life. The first great example of Athenian black-figured ware is the so-called François vase, by the potter Ergotimos and the painter Klitias, dating about 560 B.C. Cups by the "Little Masters" have exquisite little figures in neat trim designs. Toward the end of the period came three great masters; Nikosthenes, who painted spirited scenes of revels on metallic-shaped amphorae; Amasis, more monumental in style; and Exekias, who designed his figures with unerring finesse and cut the details with great precision and delicacy. With them the possibilities of this technique were exhausted; in fact it is amazing, in view of the limitations of the technique, that they were able to produce such varied and intricate designs. —W.R.A.

**Blackfoot art.** See Plains Indian art.

**black tortoise.** See SYMBOLISM IN FAR EASTERN ART.

**blanc de Chine.** French name for celebrated white porcelain made in China. See CERAMICS II.

**Blaue Reiter, the** (Ger. the Blue Rider). The "Blaue Reiter" was an editorial board which consisted of Franz Marc and Wassily Kandinsky and was set up in order to publish a magazine of the same name. Marc wrote on the 8th of September, 1911 to his friend, the painter August Macke, ". . . a magazine which will become the mouthpiece of all the new and sincere ideas of our day: painting, music, the stage, etc." By examples of old folk art they intended to demonstrate how deeply the modern art movement was rooted in the old one. A reconciliation between art and the people was the goal of the "Blaue Reiter", which was to be published at irregular intervals. On the 9th of November, 1911 the first copy was arranged, and was published in 1912. On the second of December, 1911, Franz Marc and Kandinsky left the "Neue Vereinigung", to which Jawlensky, Werefkin, Erbsloeh, and others belonged. These two artists then decided to enlarge the editorial organization to include art exhibitions. The first exhibition took place between the 18th of December, 1911 and the 1st of January, 1912, under the name the "Blaue Reiter" in the art salon of Thannhauser in Munich. From there the exhibition traveled to Cologne and to most of the larger cities of Germany. The "Blaue Reiter" is not, as is erroneously assumed, a society of artists, but the artists of the modern movement, German, Russian, French, etc., were invited to participate in these exhibitions. Only the first copy of the magazine appeared. All their efforts were interrupted by the outbreak of the world war and rendered useless by the death of Franz Marc in 1916. See Alois J. Schardt, *Franz Marc,* Berlin, 1936. —A.J.S.

**blazonry.** See HERALDRY.

**bled.** *Book.* To bleed. To so print the page and trim the edges of a book that pictures and titles on covers run over the edge of the page.

**blender.** A large brush used by painters to soften and smooth coatings, usually of oil paint, the blender has a history that runs from some time at least as early as the 15th cent. until the present. Generally it is made of badger hair, is round in shape, fairly long, and flat at the end. This allows it to be tapped over the wet paint, as well as drawn over it with the usual brushing stroke. —G.L.S.

**bleu de roi.** See CERAMICS II.

**blighted district.** See CIVIC PLANNING.

**blind.** *Book.* Blind-tooled. Without foil or color.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

**blind arcade.** A range of arches attached to a wall without an opening.

**block.** (1) In masonry: Stone usually more than two inches thick; natural or dressed. (2) *Cer.* Plaster mold made from original model. See CERAMICS I.

**blocked-out.** See SCULPTURE.

**blocking in.** See design.

**block print.** See PRINTS AND PRINT PROCESSES.

**blooming.** The cloudy white film which appears on varnished surfaces. It is largely induced by moist atmosphere.

**blossoming plum.** See SYMBOLISM IN FAR EASTERN ART.

**blottesque.** Having blots or coarsely represented.

**blue and white ware.** Both over- and underglaze decoration in blue on a white ground.

**blue bice.** See blue verditer.

**blue note.** See AMERICAN NEGRO MUSIC.

**Blue Rider, the.** See Blaue Reiter, the.

**Blue Rose group.** See RUSSIAN ARTS.

**blues.** Melodies in dreamy, sentimental, "blue" mood, of Negro origin. See AMERICAN NEGRO MUSIC; AMERICAN NEGRO LITERATURE.

**blue verditer.** Frequently called blue bice, this is an artificial basic copper carbonate, a blue pigment chemically similar to azurite. It probably was made at some time early in the Middle Ages and is still available, though rare. —G.L.S.

**blunger.** *Cer.* Tank with revolving arms for mixing clay. See CERAMICS I.

**boarding.** See grain.

**board of appeals.** See CIVIC PLANNING.

**board of survey.** See CIVIC PLANNING.

**bocasine** (F.). A fabric similar to fine buckram.

**Bodhisattva.** See INDIAN ART.

**bodhi tree.** From *bodhi* (Skr.). The tree under which Buddha is said to have sat during the period of enlightenment. See INDIAN ART.

**body.** In pottery or metal, the main part of a receptacle.

**body color.** In painting, an opaque pigment as compared with a transparent finishing paint.

**Boehm flute.** See MUSICAL INSTRUMENTS.

**Bohemia, art of.** See CZECHOSLOVAKIA, ART OF.

**bole.** The inert or pigment material of the coating which is laid as a ground for gold leaf is usually called bole. The name is an ancient one and, in modern frame-making and gilding, is sometimes supplanted by the term, gold size. There is no fixed color. Traditionally, bole may be white, green, or one of many shades of dull red. The most common is the last, and the ordinary gold ground of the Middle Ages and the Renaissance was made of glue size with a brick-colored Armenian earth. Any bole must be somewhat amorphous and very finely divided, a clay rather than a purely crystalline material, which will provide a smooth and non-abrasive foundation for the leaf. —G.L.S.

**bolero.** One of the classic Iberian dances of Spain, is a couple dance, in which the man and woman perform similar movements, the man with great vigor, the woman with more restraint. The intricate steps are characterized by high leaps and rapid turns in the air. The dance is divided into three parts, the second section being devoted to solos by each of the dancers. These solos give opportunity for individual improvisation within the traditional style of the dance. The dancers accompany themselves upon castanets with rapid rhythmic patterns in 3/4 meter. —J.G.

**Bologna, school of.** The founders of the so-called eclectic school of Bologna are Lodovico, Agostino and Anniable Carracci, all born in Bologna between 1555 and 1560. They opened the Academy of Painting in Bologna in 1589. In contrast to the prevailing "Caravaggismo" (the realistic movement created by Michelangelo Merigi da Caravaggio), the Carracci followed the footsteps of Raphael and Correggio. The most famous work by the Carracci is the painting of the gallery of Cardinal Farnese's palace in Rome in 1600 by Anniable and Agostino. —L.L.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

**bolt.** *Book.* The fold of the paper in the outer edges of books; at one time found only at top and fore-edge but now also at the bottom edge or tail.

**bombazine** (Gr. *bombyx,* silk. Aristotle may have coined this term.). A light weight fabric of silk warp and worsted woof, chiefly used for mourning. Used as a mantilla material in South America. —G.W.R.

**bond.** In masonry: The disposition or lapping of stones so that vertical joints may not fall over one another, but fall over or near the middle of the stone below. —J.M.M.

**bond clay.** See ball clay.

**bond-stone, bonder.** In masonry: Stones whose longest horizontal direction is placed at right angles to the face of the wall. Bond-stones or bonders may be either "throughs" (extending through the entire thickness of the wall) or "headers" (extending only part way through the wall). —J.M.M.

**bone black.** One of the many carbon black pigments which is made by charring animal bones in a closed vessel; it is said that so-called ivory black, used by artists today, is frequently made of charred bone. —G.L.S.

**bone china.** *Cer.* Lower fired porcelain containing calcined bones. See CERAMICS I.

**bones.** See MUSICAL INSTRUMENTS.

**book.** See libretto.

**bookbinding, early.** See EARLY BOOKBINDING AND FINE BINDING.

**BOOK ILLUSTRATION** is a graphic representation which explains, expands or embellishes the text of a book. It varies in its function from scientific documentation on the one hand to pure ornamentation on the other. Sympathetic pictorial interpretation, by artistic means, of a literary creation is considered by many as the ideal province of the illustrator. The artistic value of illustration is sometimes questioned by those who feel that the images arising spontaneously in a reader's mind are spoilt by different sets of images formulated and set down by an illustrator. This criticism, while justified in certain cases, is unfair in that it finds fault with the medium as such rather than with its improper use. Tactful and discreet interpretation of a text is an indispensable quality of good book illustration.

In its origin illustration is indistinguishable from the beginnings of writing. Pictographic writing is the seed from which both writing and illustration developed. It consisted of concrete images, graphically condensed into linear characters, arranged in definite sequences so as to convey messages, record events and to serve various other purposes. Illustration proper can be said to exist as soon as the same message is recorded twice on the same document, once in characters conveying words and again by images of mainly pictorial value. Just when this was first done is impossible to say, but both the early Mesopotamian culture and ancient Egypt have yielded examples of such early illustration.

Book illustration in classical Greece and Rome has left few traces. Documentary illustration of scientific, medical and botanical texts on scrolls was widely practiced, also the author's portrait, earliest form of the frontispiece (q.v.) was very popular. Of the illustration of literary texts we know little, but there is reason to believe that Homer, Virgil and certain books of the Old Testament were the subject of elaborate picture scrolls in which the text had shrunk to a few lines of caption for each picture.

Early Christianity and the introduction of the codex greatly stimulated book illustration, which in turn became a most important mouthpiece for the Church and one of its skillfully developed teaching devices. The illumination of mediaeval manuscripts is the graphic representation of the sacred Bible texts, the pictorial explanation of the doctrines of the church and, particularly in the later mediaeval centuries, an exposition of the life of the Virgin Mary and the life and passion of Christ. It is impossible to do justice in this article to the beauty, the wealth and variety of mediaeval schools of illumination. They have become the subject of intensive study and of a highly specialized literature.

Secular elements were slow to make themselves felt in mediaeval illumination and they appear at first as part of and connected with ecclesiastical texts and pictures. Apart from certain classical illustrations, inherited from ancient Rome and copied throughout the Middle Ages, no separate secular cycles of illumination appeared until the beginning of the Renaissance.

The invention of printing did not immediately revolutionize illustration. Picture printing first served as a mechanical duplicating device of established holy compositions, such as the early broadsides of various saints and

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

other familiar Christian images. The block books of the 15th cent. too are to a large extent a multiplication of certain popular manuscripts. It cannot be denied, though, that the block book greatly contributed to the distribution of printed images among the people of Europe and to the development of the woodcut as a story telling device. From remote Asiatic sources and from its primitive European beginnings in the late 14th cent. the woodcut witnessed a century and a half of truly amazing development and refinements. It received early vitality at the hands of anonymous Dutch, German, French and Italian artists. Later on, such masters as Albrecht Dürer, Hans Holbein the Younger, Geofroy Tory and other artists of the first rank favored this technique. In the course of the 16th cent. the woodcut (q.v.) was superseded by the more refined, more sophisticated art of copper engraving and etching. These methods, enriched by specialized technical developments such as mezzotint and aquatint etching, stipple engraving and steel engraving (q.v.), reigned supreme from the 16th to the early 19th cent. Book illustration after 1500 showed itself completely emancipated from its mediaeval religious heritage. Holbein's *Dance of Death,* ostensibly an admonition to prepare for the world hereafter, introduced satire and social criticism. Emblem books, popular throughout the 16th and the 17th cent., expounded the wisdom and teaching of the ancient classics rather than of Christian theologians. Callot, Hogarth, Goya, Rowlandson and Daumier successively added portrayal of human folly in its many forms, of the horrors of war, of moral depravity and they developed satire to the point of caricature. They also laid the foundations for the modern political cartoon.

Book illustration proper was greatly benefited by Thomas Bewick's development of wood engraving around 1800, which restored much of the original directness, availability and ease of reproduction to the picture on the printed page. An undesirable element in the 19th cent. development of wood engraving was the increasing separation between artist and engraver. Lithography, arising about simultaneously, counteracted this tendency and supplied a new, very direct means of duplicating the artist's original drawing. Equally popular in 19th cent. Europe and America lithography has remained one of the favored mediums of illustrators concerned with faithful reproduction. This process, in its original form as well as in photomechanical adaptation, has also contributed materially to the development of color printing.

The invention of photography has greatly affected book illustration. It has proved valuable in a double role as provider of pictures and as a reproducing agent. Photomechanical processes have made possible the inexpensive multiplication of a great variety of art work in line and halftone, in black and white and in color. For reasons of costliness the choicest of these methods have hardly been used for regular book illustration. Emphasis has been on quantity, speed and low production cost. This is one of several reasons why the old-time processes of picture printing are being revived by many artists in many lands. Woodcut and wood engraving, linoleum cut and lithography are the chief beneficiaries of the current movement. See *Illuminated Manuscripts,* J. A. Herbert, London, 1912; *The Illustrated Book,* Frank Weitenkampf, Cambridge, 1938; *Modern Illustration Processes,* Charles W. Gamble, London, 1938. —H.L.H.

**book of emblems.** See emblem.

**book of hours.** The name given to illuminated prayer books during the Middle Ages for persons of high rank. The term is a translation of the French *belles heures* or *riches heures.* The most famous manuscript of this kind is the one called *Les très riches heures de Jean de France, Duc de Berry,* now in the Musée Condé, Chantilly, France. The scenes represented in this work were painted by the brothers Limbourg and are considered the peak of miniature painting of the Middle Ages. —L.L.

**bookpile.** See ex libris.

**bookplate.** See ex libris.

**book sizes.** In early book publishing, book sizes were known by the number of folds that made a signature. For example, folio meant a sheet folded once to form two sheets or four pages. The following sizes, although rapidly becoming obsolete, are occasionally used on book lists. They are only approximations, but will serve as a guide for determining the size of a book listed in that manner.

**border** (of a rug). The part surrounding the center, or field, is technically known as the border.

**bordure.** See HERALDRY.

**bore.** See ACOUSTICS.

**bosses.** *Book.* Protecting pieces of metal on the cover, usually incorporated in the design, as knobs or studs.

**bot** (Siam.). Buddhist sanctuary for priests only.

**botany.** Used in the worsted yarn manufacture to designate yarns made from the soft, medium length varieties of Australian and South African merino wools. It is also used to signify all fine Australian wool, particularly in Great Britain; also fine worsted fabrics. —G.W.R.

**bo tree.** From Singhalese *"bo"* which comes from *bodhi* (Skr.) (q.v.) meaning enlightenment. Generally called pipal tree.

**bottega** (It. shop, working place; particularly the artists' workshop before the abolition of the guilds or *companie* in the late 18th and early 19th cents.). Like the workshop of other craftsmen incorporated in the guilds the *bottega* was a coöperative enterprise founded upon the patriarchal basis of intimate common living and of the master's responsibility for the bodily welfare of his associates. In many cases the *bottega* was a family enterprise inherited by successive generations. All artistic work was done under the agreement that the master was to be assisted in his exertions by his associates, helpers and apprentices who in turn would profit by his artistic example. The institution of the *bottega* provided for the early and thorough education of the novice in his future craft; apprentices were engaged when between 12 and 14 years old and learned the secrets of artistic technique in many years of first menial and later more responsible occupations. When risen to the rank of assistant they would be entrusted with the execution of designs by their master who would sometimes reserve for himself the finishing touches to bring the work up to his acknowledged and expected standards. Considering the extent of such collaboration by assistants it seems inappropriate to apply too rigorously to all works of art of the past the modern concept of authenticity--execution by the master; even an artist's signature may be a trade mark rather than a personal sign and may as such be placed upon the work of an associate as a stamp of approval. —R.B.

**bottle shape.** Like a bottle; cylindrical body, flat base and slender neck.

**bouclé** (F. lock). Irregularly twisted yarn. Frize, frotte, ondule, are all collectively called bouclé yarns. Curled or loop effects in cloths made with yarns of that description. —G.W.R.

**boulevard.** See CIVIC PLANNING.

**bourrée, boutrade.** The bourrée, classified today as a pre-classic form, was first danced by the mountain peasants of central France. They had several bourrées; a flirtatious couple dance, a large group dance similar in formation to English and American long dances, and a work bourrée danced to crush grapes in the vineyards. The basic movements were skipping, cut-steps, and stamps in 4/4 meter with a characteristic quarter-note upbeat and a stamped accent on the third beat of each bar. People accompanied each other by singing, shouting, and beating with their hands. In the sixteenth century, the French court adopted the bourrée for a short time, but its lusty nature evidently did not lend itself to refinement. The dance soon disappeared from court ballrooms. Many bourrée steps were carried over into the ballet, however, and composers of the period often included a bourrée in their instrumental suites. —J.G.

**bow.** *Mus.* A concave stick (formerly convex) controlling the length and tension of the attached hairs which are drawn across the strings of the stringed instruments to produce musical tones; the larger the instrument, the shorter the bow. —M.E.

**bowl.** Concave receptacle, small in size.

**box set.** See STAGESETTING.

**braided rug (rag rug).** Made from three narrow strips of cloth and braided together. The braided strips are then sewn together. The rug may be oval, circular or rectangular in shape. —B.E.J.

**brain wave.** The record of the action current (q.v.) generated by nerve impulses in the brain regarded as a measure of the nerve impulse under various conditions of mental and physical activity.

"The subject to be experimented upon in the laboratory is put into a room where he rests comfortably on a couch. Two or more elec-

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

trodes are attached to different parts of the surface of his head, and elaborate electrical registering apparatus records on moving picture film the presence of nerve impulses by means of the accompanying electrical deflection. It seems fantastic to see these pictures of the nerve impulse revealing its rate and variation with location, complexity, intensity and duration of the processes. We can not only see action-current-waves but can convert them into sound which we can hear. This harnessing of brain waves is in electrophysiology for nerve impulse quite analogous to the harnessing of radio waves for the conduction and generation of musical sounds.

"The fundamental thing revealed is that the brain, like our electric lighting circuit, acts through alternating currents. Thus from the very beginning the principle of alternating current was adopted for our nervous systems because it is economical. That is an astounding fact.

"There are certain basic rays—such as the alpha ray which beats at about ten per second—and a series of other rays of higher frequency designated by Greek letters. The same principles that register the brain wave can also be used in tracing the course of the nerve impulse from the sense organ through various intricate centers to the brain or from the brain through various centers to the muscle. We now therefore, have, the means of discovering the origin and course of the nerve impulse, whether it be incoming or outgoing. We may look upon the brain as a central station at which incoming and outgoing impulses are distributed through various centers in the spinal cord and other parts of the nervous system.

"To give one illustration of the application of this to music, one of the problems in the study of the vibrato is to determine what elements of the nervous system control the pulsations of the vocal cords in the vibrato cycle affecting pitch, loudness and time. Pursuit of this problem is a fascinating one because it leads to the discovery of fundamental biological principles almost infinitely complex and yet frequently measurable and explainable. Here the musicologist is in a situation analogous to that of the astronomer, who with telescope and spectroscope, intricate mathematical theories and untiring observation, reveals law and order in the system as a whole, although he can observe only one infinitesimally small part of it at a time." C. E. Seashore, *Pioneering in Psychology*, University of Iowa Press, 1942.

**branle of Brittany.** See passepied.

**branle of Poitou.** See courante.

**Brazil, The Colonial Architecture of.** Throughout the colonial period (1500—1821) Brazilian architecture following the style of the mother country, Portugal, remained distinct from that of Spanish America and, on the whole, less original. The earliest buildings, around Baía, the old capital, and in the region of Recife, were of mud and wattle thatched with *pindoba* palm. The next stage, of wood and rubble (*pau a pique*), closely resembled the half timber architecture of northern Europe. It is found in the 17th cent. Pernambucan landscapes of Frans Post and in existing 18th cent. houses at Ouro Preto. Otherwise the Portuguese custom of covering the walls with painted plaster, except for angle pilasters, frames and cornices of cut stone, was universal. Roofing of tile was general, as in Spanish America, but after the Portuguese style, roofs were higher pitched, and terminated at the lower angles with projecting tiles in Oriental pagoda style (*bicos*). In the 18th cent. window sashes were employed, especially in the south, after a Portuguese custom derived from England, with panes in a variety of shapes.

As opposed to Spanish America( Mexico, Antilles, Peru and Bolivia) there were almost no reflections of the Manoeline Gothic or Plateresque styles because formal building in Brazil came only after those styles had ceased to be used in Portugal. The Jesuits, the first great builders, brought the severe Counter-Reformation style to the litoral, where it remained in vogue until the early 18th cent. The Franciscans in their convents of the Northeast introduced simple two-story Doric cloisters derived from the Florentine Renaissance. During the Dutch occupation of the north (1624—1654) some reflections of the Netherlands Baroque occurred, especially in Recife. In the 17th cent. country churches, convents and private chapels were often given entrance porches (*alpendres*) roofed in tile and supported on stubby Doric columns. Plantation houses were frequently surrounded by these porches. The 17th cent. church facade arrangement of a circular window over the door, flanked by two rectangular windows was expanded in the 18th cent. to systems of three and five doors surrounded by a corresponding number of windows. Twin lateral towers were, as in Spanish America a common feature of church

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

facades, those of Minas Gerais being often round or oval in form. There was almost no elaborate use of baroque sculpture on these facades, as in the Churrigueresque buildings of Spanish America. But in the 18th cent. the Portuguese Rococo made itself felt in the graceful, curving lines of lightly sculptured doors and windows. In Minas Gerais, where the gold broom of the mid-18th cent. provided funds for ambitious building, much richer soapstone carving by Antonio Francisco Lisboa (*Aleijadinho*) and his school animated the facades. Toward the close of the century Custodio de Faria brought the incipient neo-classic style to Rio de Janeiro, the capital after 1762. At the same time neo-Palladian Italianate elements appeared in the church architecture of the extremes of the country, at Belem and in the Jesuit missions of the Sete Povos of Rio Grande do Sul, where architects like Giovanni Battista Primoli came from Argentina and Paraguay to work.

In the plans and roofing of Brazilian churches further contrasts with Spanish American methods are found. With the exception of a few buildings in Minas Gerais, simple rectangular plans prevailed. Round apses were avoided. Lateral corridors giving on to the nave often lead to a series of sacristy apartments behind the apse, although in country churches the sacristy is an outside excrescence. Projecting chapels almost never occur. True vaulting and cupolas, common in Spanish American building, were avoided in Brazil as they were in Portugal. Roofs were steep, while inside wood ceilings imitated shallow barrel vaults. In this way problems of engineering were avoided.

The decoration of church interiors was equally simple. Except in a few city churches of Baía and Rio de Janeiro, all-over Baroque polychrome wood carving gave way to isolated altars set against plain white washed walls. High altars were smaller and less complicated than the corresponding sculptured retables of Spanish America. Their centers were occupied by elaborate stage pyramids surmounted by the statue of a saint (*tronos*). This is a dramatic Portuguese feature usually covered by a curtain but on solemn occasions illuminated by ascending tiers of lighted candles. Chancels, corridors and sometimes the naves were ornamented with dadoes of the blue and white scenic Portuguese tiles. Jacarandá rosewood, handsome mahoganies, walnut and tropical woods were used for altar rails and sacristy and chancel furniture, handsomely carved in the Portuguese versions of Queen Anne, Chippendale, Louis XV, and Empire styles. Painted murals and altarpieces were fewer and less distinguished than in the churches of Spanish America.

The secular architecture of colonial Brazil followed Portuguese country models. Moorish or *mudéjar* influences, so important in Spanish America were scarcely felt; hence the inner patio, *artesonado* ceilings, and plaster arabesque were little used. Town houses were simple one and two story affairs, with window and door frames like the churches unceiled roofs, informal interior trim—very different from the lofty elaborate Spanish American palaces. In Baía and Recife some much higher houses were built, often with handsome sculptured doors and with kitchens on the topmost floor. In old towns of the Northeast some roofed wooden balconies are still found. Heavily latticed, these were a feature of colonial towns. In the streets, graceful, rococo wall fountains, often composed of dolphin motives, like those of church sacristies, were another Portuguese importation.

Public buildings, of which few have survived, imitated the Portuguese house forms. City halls in the Baía region had the façade, arcades, and central towers of the Spanish American *cabildos*. More frequently they were designed in the Iberian imitation of a Louis-XV *hôtel*. The prime example is the penitentiary (now museum) of Ouro Preto, begun by the governor Luís da Cunha Menezes in the 1780's.

Brazilian colonial building, like that of Portugal in relation to Spain, was, as compared with that of Spanish America, less imposing, less decorated, less varied, less structurally complicated, less influenced by Moorish construction and decoration. Its character is rural, rather than urban. Its distinction is its very simplicity, the justness of its proportions, and the delicacy of its limited decoration. See LATIN AMERICAN ART; also *Brazil builds,* New York, Museum of Modern Art, 1943; Cerqueira Falcão, (*Edgard de.*) *Reliquias da Bahia,* Sao Paulo, 1940; *Revista do Serviço do patrimonio histórico e artístico nacional,* Rio de Janeiro, v. 1-5, 1937-41; Smith, Robert C., The colonial architecture of Minas Gerais in Brazil, *Art Bulletin,* v. 21, 1939. p. 110-159. —R.C.S.

**breadth.** An art object so characterized has its details massed in such manner as to give the effect of large size with unity.

**breve** (It.). *Mus.* Literally, short. Formerly the shortest note, now the longest note in music notation. Twice the length of the whole note (semibreve). **alla breve.** A doubling of the tempo, using the minim (half note) as the unit of beat instead of the crotchet (quarter note); i.e., 2/2 meter instead of 4/4. Also, sometimes indicates 4/2 meter. See neumes; NOTATION. —M.E.

**breviary.** See MEDIEVAL MUSIC.

**brick Gothic.** See GERMAN ART.

**bridal.** See COSTUME ART.

**bridge.** See RADIO DRAMA.

**bridge.** Bridges, constructed for carrying roadways or railroads across rivers and valleys, have always been and still are not a mere technical but an architectural task as well. Only the 19th cent., induced by the prevailing use of the new building materials iron, steel, concrete, left this problem entirely to the engineers. Bridgebuilding has to be done not more and not less functionally than the solution of any other architectural problem. There is only one phenomenon by which the bridge is distinguished from other works of architecture: it does not create and shape space but spans and cuts it.

The most primitive form is the post-and-lintel type of construction, a timber or stone beam, supported at both ends. Later, but still in prehistorical times we find the cantilever bridge of timber beams or stone blocks protruding from both sides. In Mesopotamia, the brick vaulted arch is already used around 3800 B. C. Building vaulted bridges in real stone was an essential part of Roman civilization. The Roman type of the barrel vaulted bridge characterized by the semi-circular arch and the perforation of the piers ruled European bridge architecture through almost 1000 years. Ancient writers like Julius Caesar (100-44 B.C.) and architects like Vitruvius (1st cent. B.C.) give so exact architectural details that we are enabled to reconstruct these bridges. Numerous examples are still preserved everywhere in Italy, France, Spain, Germany and the Balkans.

Mediaeval bridges do not show any principally new solutions. They are composed by arches of different diameters, later even by stilted arches. Fortifications, esp. watch-towers, began to enrich the outline (e.g. bridges in Prag, Regensburg, Würzburg, Avignon, Montauban, Toledo, Carcassonne, Florence, Verona, all of them between 1100 and 1300). Some bridges are covered, framed by rows of houses (Old London Bridge, originally built 1176-1209, houses on both sides around 1300). Switzerland, Germany, and Austria excelled in wooden covered bridges.

The Renaissance bridge revived again the ancient principles of bridgebuilding. The artistic and technical theory is mainly developed in the treatise by Andrea Palladio (1508—1580), based on Vitruvius' *De Architectura Libri Decem* (Ten Books on Architecture). Some of the most wonderful Renaissance bridges, like those in Florence (Ponte S. Trinità, in 1567 by Bartolomeo Ammanati, 1511—1592) show already flat barrel vaults instead of the Roman semi-circular type.

The bridges of the 18th cent. in France stimulated mainly by the work of Jean Rodolphe Perronet (1708—1794) bridges of Orleans, Nantes, Neuilly, Paris, Pont de la Concorde, all of them between 1750 and 1790 connected technical progress with beautiful architectural forms. The arches became much flatter, the spans much wider than before. Perronet's works set the example for the architecture of stone bridges till today. The 18th cent. furthermore invented complicated systems of wooden constructions executed mainly in Switzerland, Germany and Scandinavia till about 1820, in the United States till about 1880. The famous covered bridges of Vermont, New Hampshire and other American States represented a special branch of this technique.

The 19th cent. stimulated bridgebuilding by two facts: the introduction of a new material, iron—later on steel—and by the invention of the railroad. Simultaneously with this technical progress the artistic interest receded. Only at the beginning of the 20th cent. people became interested again in the architectural aspects of the problem.

The first iron arch bridge was built 1776 in Coalebrookdale, England, with a span of about 100 feet. Five types of iron and steel bridges exist: the beam bridge, the arch bridge, the suspension bridge, the cantilever bridge, and the combined system, distinguished from each other by the different distribution of compression and tension in the individual elements of construction. Examples in Europe: Westminster Bridge, London (1854—1865), Garabit Valley (1885, span over 500

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

feet), Firth-of-Fourth Bridge (1890), Pont Alexander III, Paris (1899); in the United States: Eads Bridge, St. Louis, Miss. (1868—1874), Brooklyn Bridge by John A. Roebling, New York, N. Y. (1867—1883). The great steel bridges of the 20th cent. increase the span by improved construction, but more important is the re-gained interest in their architectural appearance. The suspension type is preferred. Examples: George Washington Bridge, New York, N. Y., (1927—1931), Waldo Hancock Bridge, Bucksport, Maine, (1931), Golden Gate Bridge, San Francisco, Calif., (1937), Oakland Bay Bridge, San Francisco, Calif., (1933—1937), Whitestone Bridge, New York, N. Y., (1937—1939).

Bridgebuilding received a new stimulus from the introduction of concrete and reinforced concrete, more in use in Europe than in the U. S. A. These materials combine the static advantages of steel and concrete.

The characteristic aesthetic element of the bridge is the emphasis of the outline. In any kind of material the bridge can become a work of architectural art only by the cooperation of the calculating engineer with the creative artist. See J. Furtenbach, *Architectura-civilis,* 1627; A. Martinelli, *Descrittione di diversi Ponti, etc.,* Rome, 1676: A Palladio, *The Architecture,* vol. III, 1730; J. J. **brightness.** See COLOR.

**brilliance.** Is a sensation attribute of color, the same as brightness. See COLOR.

**brindisi.** Drinking song.

**broadcasting of music, the.** The broadcasting of music belongs only to the most recent history of wireless communication. Early attempts to transmit and receive electrical impulses through the air produced signals which took the form of a visible spark or an audible buzz. The latter signals grouped as longs and shorts according to a code could be used to transmit messages. The classic experiments which established the possibility of wireless communication were made by Guglielmo Marconi in the closing years of the 19th cent.

The spark transmitters used for communication in code were intermittent in character and incapable of generating a sustained carrier wave which was necessary for the transmission of music and speech. It was Duddell, an English investigator, who in 1900 discovered that an electric arc could be used as a source of high frequency energy. By combining Duddell's singing arc with a microphone in a transmitting circuit, the Danish engineer, Vladimir Poulsen, produced the wireless telephone and by 1903 had demonstrated the possibility of transmitting speech over considerable distances. In 1908-09 engineers of the German Telefunken Company attempted to transmit speech and music by this method between Sandy Hook and Bedloes' Island, New York harbor, a distance of approximately eighteen miles. The music consisted of a record of Verdi's *Anvil Chorus* played by a cylinder phonograph of ancient design. The arc, however, was fluctuating, unreliable, and difficult to adjust.

It was the invention of the three element tube by Dr. Lee De Forest which provided a more reliable medium. This invention which was the Fleming valve modified by the interposition of a grid between the glowing filament and the cylinder, marked the end of the period of tentative experiment and the beginning of practical broadcasting. The development of the wireless telephone was enormously stimulated by the demands made by World War I when it was esp. valuable as a means by which observation planes might communicate with the ground forces.

Progress during the post-war period was

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

fumbling. A wireless link used by the telephone company to connect Catalina Island with the mainland had to be abandoned because of the lack of privacy, since conversations so transmitted could be picked up by any operator who tuned in. Much experimental broadcasting was done and the amount of amateur interest was enormous. A broadcast by Dr. Lee De Forest of the voice of Eugenia Farrar in 1907 was picked up by chance by an operator at the Brooklyn Navy Yard and excited incredulity. Programs of especial interest like those transmitted by Station 8XK operated by Frank Conrad, a Westinghouse engineer, attracted a considerable audience of radio amateurs.

It was largely with the idea of promoting the sale of radio sets that manufacturers of electrical equipment commenced broadcasting on a regular schedule. The first broadcast by a commercial station was the report of the Harding election returns broadcast by the Westinghouse Station KDKA from East Pittsburgh. Music emanating from this station consisted not only of phonograph records, but of actual musical performances by the Westinghouse band, an employee organization. Later the KDKA Little Symphony was organized. Early broadcasts originated in a tent pitched on the roof of a factory building. The erection of a tent indoors in the attempt to obtain similar favorable acoustical conditions led to the burlap draped studio which, in turn, has been largely replaced by acoustically treated wall surfaces by which the resonance of a studio can be controlled. Other important pioneer stations were WJZ broadcasting from Newark and WDY broadcasting from Aldene, New York, as well as WGY in Schenectady.

The advantage of remote pick-up soon became obvious since performers otherwise had to be induced (in the case of the New York stations) to make the trip from New York to New Jersey. Accordingly, we find WGY utilizing telegraph wires as a connection with New York and thus employing programs originating with WJZ. Similarly the American Telephone and Telegraph Station WBNY (later WEAF) utilized a studio in the old Waldorf Astoria Hotel. The development of large commercial stations was recognized by the Department of Commerce which attempted to resolve the growing problem of interference by establishing a group of Class B stations chosen on the basis of power, fidelity, and superior program content and assigning to them a new broadcasting frequency, the 400 metre band. The other stations continued as hitherto on the 360 metre band. Congress tardily provided a regulatory body by authorizing the creation of the Federal Radio Commission, appointed by President Coolidge in 1927.

As early as 1916 David Sarnoff, then in the commercial department of the American Marconi Company, sent a memorandum to the general manager of that firm which anticipated in a striking fashion the salient features of subsequent American broadcasting. "I have in mind a plan of development which would make radio a household utility in the same sense as the piano or phonograph. The idea is to bring music into the home by wireless . . . The main revenue to be derived will be from the sale of the radio music boxes which, if manufactured in lots of 100,000 or so could yield a handsome profit . . . The Company would have to undertake to make the arrangements, I am sure, for music recitals, lectures, etc. . . . Aside from the profit to be derived from this proposition, the possibilities for advertising for the company are tremendous; for its name would ultimately be brought into the household and wireless would receive national and universal attention."

After a period of hesitation the sponsored program appeared in 1924, a fact which was to give a distinctive direction to American broadcasting. The makers of radio equipment who broadcast to secure a market for their products were gradually replaced by organizations which sold broadcasting time to commercial firms who sponsored programs in the hope of making their product known and thus increasing their sales. With this came the "commercial," the announcement praising the sponsor's product, but at the same time the plan offered a practical way of financing the mounting costs of broadcasting. Early performers had been lured to the microphone by curiosity and the promise of publicity. Once this initial stage was past, performers demanded a more substantial financial return. Fees rapidly increased as radio developed stars with a mass appeal.

The first commercial program was a ten minute real estate promotion talk sponsored by the Queensborough Corporation which was promoting the development of Jackson Heights, Long Island. Finding that speeches were a very dubious means of building good will, sponsors early turned to music. The Browning King Orchestra sponsored by a New York clothing firm of that name was first in this field. The Lucky Strike Company

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

sponsored another pioneer musical program. Both of these programs appeared over WEAF.

The effective broadcasting range of an individual station was limited. Sponsors with a product of national appeal began to demand a wider coverage. Stations remote from the great metropolitan reservoirs of talent could also benefit by receiving the programs of key stations in metropolitan areas. Gradually the networks evolved. A pioneer step was the connection of Station KDKA with the Calvary Episcopal Church of Pittsburgh by telephone line. When Station WEAF was acquired by the National Broadcasting Corporation, its network connections had grown to the extent of 3600 miles of esp. designed telephone lines.

The Victor program, broadcast on New Year's Eve, 1925, was the first to utilize a national hook-up. This was preceded by a transitional stage in which there were two great broadcasting areas, the far west and the east, the Rocky Mountains serving as the dividing line.

Once continental America was linked from coast to coast by radio networks, intercontinental communication was the next step. As early as 1926 Station WJZ received and rebroadcast programs originating in Europe. By 1930 the feasibility of such programs was manifest, and at the present time news round-ups from the far corners of the globe are a usual feature of news coverage although frequently still subject to fading and excessive background noise. The distortion so often apparent in such broadcasts makes rebroadcasts of European musical programs of doubtful value at the present stage of development.

The important influence exerted by the three element tube on the phonograph and the talking film will be dealt with elsewhere. Two developments which promise to affect the future of radio should be mentioned here: broadcasting by frequency modulation and television. Stations employing frequency modulation have already entered the broadcasting field and some home radio sets are designed to receive broadcasts through this, as well as the usual channels. Since frequency modulation is not affected by static, it is an innovation of the greatest importance to musical broadcasts where unimpaired quality and freedom from background noise have always been of paramount importance.

Television, which was demonstrated in an impressive fashion at the New York World's Fair (The World of Tomorrow), excited much public interest. It is still in an experimental stage although a certain amount of broadcasting to a limited television audience has already been done. Its development was hindered rather than fostered by the advent of World War II since its operations do not lend themselves to military requirements as did radio broadcasting. Difficulties observable at present are the limited range of telecasts and the great expense involved in producing programs which include memorized texts (as in a stage play) without the possibility of a long run which is offered by a successful stage hit (see RADIO; DRAMA). Probably the transmission of films will play a role in telecasting comparable to that of the phonograph record in radio broadcasting.

—C.W.H.

**broadloom.** Carpets woven in widths 54 inches or wider, as distinguished from "narrow loom" widths of 27 inches and 26 inches. Broadloom carpet is produced as wide as 18 feet. —B.E.J.

**broadsheet.** A graphic print. A sheet of paper of more or less standard size, printed on one side only.

**brocade** (L. *broccus,* stitching). Originally heavy silk with elaborate pattern in silver and gold threads. Name now applied to many materials which resemble historic brocades. Brocade has embossed appearance and is of Jacquard weave. See also nishiki. —G.W.R.

**brocade fabrics.** Usually made of brocade light and medium weight silk; linen or cotton or rayon fabric of simple structure embellished with Jacquard figuring which may be developed by displaying either warp threads or picks of weft only, or both series of threads, more or less freely upon a ground texture usually consisting either of the plain calico or "tabby" weave or other simple and neutral weave, such as the smaller twill, satin and matt or dice weaves, according to the particular effect desired in the fabric. —G.W.R.

**brocatelle.** Name comes from *brocatel* and *brocatta,* referring to ancient patterned fabrics combined of wool and silk or cotton and wool. A rich silk fabric with a linen back that resembles a damask in weave, but a brocade in effect. The design stands out in relief from the background. No gold or silver is used in brocatelles. The fabric shows usually one color or two colors. —G.W.R.

**broché** (F. *brocher,* to stitch). Jacquard woven, it is known as swivel-broché. The threads are not carried across the whole width

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

of the cloth. In hand woven brochés the pattern filling threads are floated from selvage to selvage. —G.W.R.

**brochure.** *Book.* A small printed work. Also used to denote a "de luxe" or elaborately produced booklet.

**broken.** *Book.* A book is "broken" when the back (sewing, glueing, etc.) cracks inside from top to bottom, or head to tail. Paper is "broken" when it has been folded over.

**broken consort.** See chamber music.

**broken ink landscape.** See CHINESE ARTS.

**broken pediment.** A pediment often used in baroque architecture and in which one or both of the cornices are not continuous.

**broken range.** Term applied to masonry in which horizontal courses are continuous for short distances only (up to eight feet).

**broken twills.** Twill weaves in which the characteristic twill line is arranged to run part way of the repeat in the weave from left to right, and part way from right to left.

**bronze mirror.** In the Orient the early mirror was of bronze, polished to produce a first class reflecting surface on the obverse, and decorated in low relief on the reverse.—J.A.M.

**brooch.** See JEWELRY.

**brotherhood of St. Luke.** See POLISH ART.

**Brown Decades.** See POST-REVOLUTIONARY ARCHITECTURE AND DECORATIVE ARTS IN THE U.S.A.

**Bruges school.** A school of art that developed in 14th and 15th cent. Bruges out of the mediaeval tradition. This tradition is manifest in the work of the artists who worked in Bruges such as Hubert and Jan Van Eyck, Peter Christus, Hans Memlinc and Gheeraert David. Their work is often referred to as Flemish primitive art. —R.L.W.

**Brukskunst movement.** See SCANDINAVIAN ART.

**brush.** The chief tools of the painter, brushes have changed little in their essential character through the entire history of this art. With the exception of a special type used in ancient Egypt, a reed macerated at one end to separate the fibres, brushes have generally been of animal hair tied into a tuft and set into a handle. A few of the larger brushes in earlier practice were tied around the handle. Quills were developed as a means of holding the tuft, allowing the tied hair to fit at one end of the cut quill and the handle in the other. Metal ferrules have taken the place of quills during the last century, though the traditional holder is still commonly made and sold. Modern painters' brushes are in two general types: bristle or coarse hair, usually that of the pig; and fine hair, sable or so-called 'camel' hair. Sable brushes are made of hair from the tails of the Asiatic mink, the kolinsky, native to a district of northeastern Russia. The color is reddish yellow. This is generally considered to be the finest of the hair brushes. 'Camel hair' comes actually from a squirrel and the best of these is found also in Russia or Siberia. The color may be red, gray, or black. —G.L.S.

**Brussels carpets.** Woven by the Jacquard process and so far as basic construction goes are exactly the same as the Wilton carpets (q.v.). The only difference is that the wires have no blades on the ends so that when withdrawn the yarn is left in loops instead of being a cut pile. —B.E.J.

**buckling.** Blisters in paint film. This condition usually applies to the ground as well.

**buckram.** *Book.* A very durable cotton or linen book cloth of a coarse, open weave and stiffened with size.

**bucranium** (L. *bucranium* fr. Gr. *boukranion,* ox head). An ox skull used as decoration in Roman architecture, particularly on altars and temple friezes, usually with a garland or fillet hung between each two bucrania. —L.T.S.

**Buddha's hand.** The citron fruit with its fleshy, fingerlike parts; it often appears as a motive in Oriental art. See SYMBOLISM IN FAR EASTERN ART.

**Buen Retiro pottery.** See SPAIN, ART OF.

**bugaku** (Jap.). A classic court dance, now rare, in which large masks were worn. See JAPANESE ART.

**Bühnenweihfestspiel** (Ger.). The epithet Wagner bestowed on his last musical drama, *Parsifal* ("stage consecration play").

**building line.** See CIVIC PLANNING.

**building regulation.** See CIVIC PLANNING.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

**buisino.** See MUSICAL INSTRUMENTS.

**buke-zukuri.** See JAPANESE ART.

**bulb bowl.** A circular shallow bowl, generally with three short legs; used in China as a container in which to grow flowering bulbs.

**bulbous.** A bi-symmetrical convex contour; swelled like a bulb.

**Bulgaria, art of.** When we pass over the remains of Thracian, Greek, and Roman art found on the territory of Bulgaria, the old Bulgarian art really commences with the foundation of the first Bulgarian Empire with its capitol at Pliska-Aboba in the northeast section of the country. Here from pagan times was a great palace with the foundations and lower parts of the columns constructed of large blocks of stone, many of which were obviously brought from the Roman ruins of Nikopolis. They show a strong similarity with various Asiatic arts, esp. that of the Sassanids, and this similarity is even more marked in the case of the monument of the mounted Bulgarian king of the 9th cent. carved on a rock at Madara. This is really a unique monument in Europe and the Balkans.

After the introduction of Christianity, a basilica of an Oriental type was built near Pliska, but the capital of the Bulgarian Empire was transferred to the now destroyed capital of Preslav and it is here that the Byzantine influences begin to appear. Tsar Boris also established churches in various parts of his domains including Ohrid; it is very likely that the oldest parts of the basilica of St. Sophia at Ohrid belong to this period. It is a vaulted basilica with pillars, with three naves and three aisles.

The greatest center of middle Bulgarian art is the city of Tirnovo, the capital of the second Empire, which is constructed largely of bricks and colored stones often arranged in layers. Most of the old churches are domed and adorned with frescos of a special style.

Near by in the village of Arbanassi are the best preserved private houses of the Middle Ages. They are plain with extremely thick walls, in some of which are passageways and hiding places. The main floor is essentially a store house without windows and the dwelling quarters are on the second floor with small windows.

Another common type of architecture are two-storied churches, in which the church below served as a mausoleum and the church above—but unconnected—was undoubtedly a chapel for the family. Such was the Church of Boyana near Sofia.

The Middle Ages saw extensive building of churches and monasteries such as the Monastery of the Transfiguration at Tirnovo and of St. John at Rilo. In all of these, and esp. on the iconostases, are exquisite examples of wood carving which often show the same type of oriental influences that have always been connected with Bulgarian art. There also remain examples of silver work which seem to come from a national school.

With the Turkish conquest, major works of art become fewer and fewer and Turkish influences appear, although there are relatively few important mosques in the country such as the Tombul Djamia of the Vizier Sherif in Shumen built in 1649. Most of the old private houses were of stone with wooden projecting balconies and approximate an oriental style.

Modern art, properly so called, begins with the rise of the movement for independence in the 19th cent. and the modern cities such as Sofia are being steadily reconstructed in a more modernistic style. Yet such monuments as the Church of St. Alexander Nevsky in Sofia, built by Russian architects after the liberation, are in a typical Russian style, much more ornate than are the more sober Bulgarian churches and buildings which rely for their beauty on interior decoration.

Modern painting has developed first under the influence of St. Petersburg and then of Vienna, but later the dominant influence was that of France. In its early stages, the modern art followed the same path as did the literature. The early artists were interested in depicting the village life, the local customs and traditions and had a narrow range of interests. They were succeeded by foreign trained workers, such as Andrei Nikolov in sculpture, the outstanding Bulgarian artist. Ivan Lazarov represents the modern stage of the more purely national art.

In painting too Ivan Murkvichka and Anton Mitov were the teachers in the first phase of work but since that time Bulgarian painting has branched out into all fields. Thus Boris Denev and Nikola Tanev are the leaders in landscape painting and views of village life with Nikola Petrov and Constantine Shterkelov among the still younger men. In decorative and imaginative art Nikolai Rainov is among the leaders. Special attention must be paid to the caricaturists Alexander Bozhinov and his younger contemporary Ilya Beshkov.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

Also Vladimir Dimitrov Maistor with his simplified and symbolic figures and Boris Georgiev with his mystic symbolism are somewhat outside of the usual path of Bulgarian art.

In general, the fine arts of modern Bulgaria represent that same tendency which is so marked in the literature. There is an extreme emphasis on history and a preoccupation with the passing aspects of village life which has prevented the proper adjustment of the Bulgarian people to the world around them and has created feelings which the chauvinists and intriguers have led away easily from the normal democratic instincts of the Bulgarian people. The very healthiness and local patriotism of Bulgarian democracy have been counterbalanced with a narrowness which has involved the people in three disastrous wars within thirty years and the future of the national art depends upon the securing of a psychological balance and tolerance which has hitherto been lacking. See Bogdan Filow, *L'Ancien Art Bulgare,* Paris, 1922; R. H. Markham, *Meet Bulgaria,* Sofia, 1931.—C.A.M.

**bulk.** *Book.* The thickness of the book before binding.

**bulk zoning.** See CIVIC PLANNING.

**bull-roarer.** A sound-producing ceremonial instrument used in some parts of Oceania and consisting of a tube or slat that is whirled from the end of a string. See OCEANIA, THE ARTS OF.

**bung.** *Cer.* Tier of saggers (q.v.) or ware. See CERAMICS I.

**bunjin-ga** (Jap.). A modern school of painting in Chinese style.

**bureau.** See FURNITURE.

**Burgundian school.** See FRENCH ART.

**burial robe.** See COSTUME ART.

**burin.** See PRINTS AND PRINT PROCESSES.

**burlesque.** A form of variety theatrical entertainment in the U. S. comprising as its chief attraction scantily costumed dancing girls, some of whom "strip tease" or remove their garments during a bubble or feather dance. Sometimes the entertainment is a musical comedy; at other times it is a variety show of the vaudeville type. The humor is coarse and frequently bawdy. Beginning about 1870, burlesque had its greatest popularity in the first quarter of the 20th cent. —H.R.W.

**Burma, art of.** See SOUTHEASTERN ASIATIC ART.

**burning.** *Cer.* The firing of clay products in a kiln in temperatures from degrees Fahrenheit 1700 to 2100.

**burnisher.** (1) Gold leaf is commonly rubbed or polished after it is laid with some kind of a hard stone known as a burnisher. The most common stone for this purpose now is agate, but haematite is frequently mentioned in treatises of the Middle Ages and the Renaissance. During those periods, also, teeth of animals were made into burnishers as were fine stones such as sapphires, emeralds and rubies. (2) *Etch.* A smooth, highly polished, round piece of steel for reducing shadings that are too dark and for removing scratches. See PRINTS AND PRINT PROCESSES. (3) See GLASS AND GLASS-MAKING.

**burnishing.** See PRINTS AND PRINT PROCESSES.

**burnt sienna.** See iron pigments.

**burnt umber.** See umber; iron pigments.

**burr.** In an engraving or dry point, the rough or torn edge of the lines made on the metal plates by the graver or point; also the softened lines they produce in the prints if they are allowed to remain on the plate instead of being removed with a scraper. The burr is generally allowed to remain on dry points, while engravings are usually scraped so that their lines are sharp and clean. See drypoint (an intaglio process); see PRINTS AND PRINT PROCESSES. —R.M.

**bush dwellings.** See DOMESTIC ARCHITECTURE.

**Bushongo art.** See AFRICAN NEGRO ART.

**busine.** See MUSICAL INSTRUMENTS.

**busshi** (Jap.). A carver of Buddhist images.

**butsu-e** (Jap.). Buddhist paintings.

**butterfly.** See SYMBOLISM IN FAR EASTERN ART.

**buttress** (Old Fr. *bouter,* to bear against). A mass of material, usually masonry, built against a wall to support or strengthen it. —J.M.M.

**byobu** (Jap.). A folding screen, generally of six panels on which the best masters lavished their artistic skill. —J.A.M.

**bypass.** See CIVIC PLANNING.

**BYZANTINE ARCHITECTURE** (4th cent. to the present). Constantine, a ruler who understood the times in which he lived, established the capital of the Roman Empire at Byzantium (324) and thereby gave shape and direction to the Eastern, Greek-speaking half of Christendom. Byzantine architecture dates from this foundation, being in succession to Roman, Hellenistic, Syrian, Sassanian-Persian, and all of the ancient styles of the Near East. In its development it constitutes a synthesis of principles and purposes inherent in all of these applied for the expression of its own inner spirit. This synthesis was essentially that of Greek and oriental elements and was fully attained in the reign of Justinian (527-565).

The formulating period is marked by experiment, creative imagination and bold engineering. It includes churches built by Constantine on the characteristic basilica plan in Constantinople and Palestine (Bethlehem), shrines such as the Holy Sepulchre at Jerusalem, the structures at Ravenna, examples at Salonika (St. George, S. Sophia, St. Demetrius) and in Constantinople St. John the Baptist of the Studion, the first S. Irene, SS. Sergius and Bacchus and Hagia Sophia. The basilica style, without cupola, was given vigorous independent handling in Asia Minor and esp. in the stone buildings of Syria, distinguished for admirable masonry, coloristic decoration and structural elements such as stone vaults, stone roofs, towers, etc. (The traditional basilica type of structure may not be considered further. Suffice it to say that it continued in the East for centuries and there is scarcely a location explored by excavators that does not reveal an example. The Syrian style, investigated thoroughly by H. C. Butler, possesses independent characteristics and merits special analysis beyond the scope of this article. Syria is also rich in the remains of civic buildings, houses, palaces, inns, shops, etc., all of which, as elsewhere in the Byzantine area, must be excluded from further mention.)

The first period closes with the dispute about images (Iconoclastic edict of Leo III, 726, to 843), and introduced the second great period known as Mid-Byzantine (11th cent. to capture of Constantinople by the crusading knights in 1204, and later). It is characterized by the prevalence of the Greek-cross plan, esp. marked on the exterior by the cross arms, elevated drum and dome (often of small diameter), smaller domes on corners and elsewhere, and special attention to exterior decoration. This is the standard church of the Greek rite to the present day and is found everywhere, notably in Constantinople, Greece and the Balkan states. The style in Armenia represents an independent school, and Russia developed its own interpretation. Thus, while the Byzantine principle was standard it allowed flexible handling as national and racial instincts suggested. The last period, from the recovery of Constantinople by the Byzantines in 1261 (and marked by the loss of the city to the Ottoman Turks in 1453), on down to the present exhibits such variations, at times marked by loose and ostentatious usages, and on other occasions by traditional conservatism.

The general formula for Byzantine architecture may be stated thus: an organization of subordinate masses receiving the thrust which originates in the apex of the cupola which crowns the vertical axis. The two elements emphasized in this formula are (1) the dominating cupola, and (2) the subordinate masses on which it is lodged and their organization, all of which are functional architecturally and expressively.

Thrust is active within the mass of the whole. The buttress system is within. There is very little exterior buttressing, such as the tower-like piers which span the north and south aisles of Hagia Sophia. Structure is essentially self-buttressing. It creates an equilibrium of balanced masses, and being functional in all of its parts, it is accordingly, organic. The opposition of forces affords a sense of life, indeed of drama, being in this respect quite different in principle from the horizontal repose of Greek style (which is also organic but in a different way).

The typical Byzantine structure is of central type, with great variety in ground plan: (1) circle, polygon, square, for simple structures such as baptisteries, tombs and memorials of martyrs and (2) radiating extension of the above; surrounding aisle for circle and polygon, cross with equal arms, projecting exedras and other masses; (3) approximations to rectangle and square, including within its lines all subordinate masses, with the exception of eastern apse. This is the standard plan, generally accepted through the centuries to the present day. This approximation was worked

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

out by experiment during the 6th cent. (S. Vitale at Ravenna, S. George at Ezra, cathedral at Bosra, SS. Sergius and Bacchus at Constantinople) and attained an unrivalled climax in Hagia Sophia. It resolved the conflict between the vertical axis and the liturgical, which is longitudinal. Decorum in public worship is violated when the service is performed at the center of the building, and it requires the perspective of a nave to focus respectful attention on the altar. Byzantine structure placed the altar in the projecting apse (as in the basilica), contrived three aisles as in the basilica (but by novel means), and at the same time crowned the structure with a dome or cupola, effective both within and without. By such means the Byzantine builders accomplished their two objectives, length and height, and with no conflict, since the effect is that of harmony.

A comparison of Hagia Sophia with St. Peter's, the principal cathedral churches of the East and West areas of Christendom resp., is revealing: the dome of Hagia Sophia is the logical climax of the building, and the thrust descending from its apex is distributed justly through all of the masses of the substructure. Unity in composition is manifest thereby, but is unobtrusive; it appears to be in the very nature of things and affords no other suggestion. The dome is visible from all directions as one approaches the structure, and requires no vantage point, near or far, for effective view. On the other hand, the soaring dome of St. Peter's rises on the west portion of the cathedral only and its thrust has no relation with the bays and narthex of the eastern section (as composed by Maderna in alteration of the plans of Michelangelo and Bramante). St. Peter's dome is superbly effective from the west, and from distant points all over the Roman campagna. It dominates the entire city of Rome (or used to), but as one advances to the portals through the famous piazza, less and less of the dome is visible until it vanishes entirely. The whole is rather like a locomotive with a smokestack. Likewise, upon entering St. Peter's the visitor would scarcely suspect that the great barrel vaults support a dome. It is only as he nears the crossing and looks up that he receives the effect. But upon entering Hagia Sophia the entire interior bursts upon him instantly, in complete coordination. Therefore, Hagia Sophia is the historic example in all architecture of the successful integration within a large interior of longitudinal and vertical axes. Hagia Sophia stands alone, but almost all Byzantine churches, even the most humble, share its principles, and reveal in the logical ordering of masses, solution of thrust and organic unity, the innate working of the Greek mind—granted the acceptance of the cupola from the eastern sections of the church. The Byzantine synthesis then, represents Greek and oriental elements in successful adjustment.

The cupola and the building of central type are regarded as Eastern in origin, various localities and periods receiving the credit and for sundry reasons (reed huts of Mesopotamia as prototype, brick as material in Assyria and Persia, technical resources in stone masonry in Syria and Armenia, etc., and the great dome of heaven over all). Considerable use of the principle had been made of it in Hellenistic and Roman architecture for tombs, shrines and memorials, but rarely for practical employment of space, with exception of the Pantheon. Christians had used it for the same purposes, and found it admirable for baptisteries and martyr shrines, and also to mark sacred places, such as the Holy Sepulchre and the place of the Ascension. The suggestion is that of emphasis, the celebration of an object of great importance,—sarcophagus, statue, baptismal font, consecrated spot. The new idea was to use it in churches for the audience hall but not for the altar which was placed in the projecting apse. What then, was on the axis of the domed church? Nothing tangible, only an idea; that of the validity of Christian doctrine as an entity, or of one dogma in particular.

Byzantine architecture is accordingly theological, with full intellectual implication of the term, and this is its distinction amid the historic Christian styles. The Eastern Church has been everlastingly interested in theology. It applied Greek philosophic usages to the organization of Christian belief, wrote the creeds and formulated the dogma. It is not without significance that it was host to the great ecumenical councils, that it weathered the bitter theological dispute about images, that it applied to itself the term orthodox, that it gave to its churches the titles of Divine Wisdom and Peace. Its architecture is fully responsive to this innate characteristic of its people and is amply revealing. Within the Byzantine structure one is assured of the logical coordination of Christian belief, its perfection and the unity of its doctrine. Again comparison with St. Peter's is instructive. The dome of St. Peter's expresses the idea of rule of competent ecclesiastical authority. It is truly Roman in its impressive suggestion of organi-

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

zation and administration of government. The dome of Hagia Sophia expresses the invariable authority of Christian doctrine.

Theology is the statement and exploration of abstract concepts. Likewise, Byzantine architecture is abstract, preeminently so amid the world's styles. Its distinction lies in this, that it contrives abstraction by architectural means, chiefly by its composition of space. Space in Roman architecture, in large examples, is handled almost as material, as if air were the invisible building material of which, together with the visible material a great building is constructed. But space in Byzantine architecture is an abstraction, the equivalent of the intellectual universe which the building connotes. Not that space is indefinite, unmarked by scale and uncertain in reliance upon structure. It is rather, that one scarcely notices such things in his preoccupation with the totality of space.

But the means by which space is made abstract are not mysterious. They are clear and obvious in their frank expression: a flat and richly colorful decorative system of marble veneering and mosaics or frescoes which masks walls and supports, draws attention away from elements of construction and seemingly denies the latter; together with a novel system of illumination precisely effective for the decorative scheme, such as the necklace of windows under the dome of Hagia Sophia, and a continuous flow of curves and spherical surfaces, leading upward to the hemisphere of the dome overhead. The icon screen too, has its part in constituting the abstraction. The liturgical celebration is largely behind the screen, so that the divine office itself is abstracted, not presented in detail for observation. The musical service can be and frequently is superb beyond words, as the interior is filled with sound, soaring upward to the dome. Space is then nothing other than music. Byzantine music (q.v.) known best through the masses of the great Russian composers, requires its characteristic architecture for complete satisfaction. The composers understood their architecture thoroughly and, as in music the master creates the substance of his composition on the statement of a theme, so in this architecture the theme is the curve. Byzantine architecture is a symphony of curves.

We turn now to some consideration of principles of construction, the anatomy of architecture, which made all this possible. The characteristic elements of the style—mass, arch, barrel vault, interesting groined vault and dome—were all at hand for Byzantine builders, whatever the specific origins of these usages may have been. Whatever the materials—brick, stone or rubble, according to local supply—the outside walls are of thick, sturdy masonry, varying in height according to the effect desired in the several portions of the subordinate masses, and broken by openings, round-headed (and occasionally horseshoe-arched), and windows and doors. The lines are straight, interrupted by projecting apses at the east end and at times by exedras and transept arms of varied plan (Holy Apostles at Constantinople and the foliate style of Armenia). All of these masses, sometimes interestingly irregular in profile, are organized about the center and form a substantial base competent to receive the thrust from the dome.

The space within is directed into nave and aisles, as in the basilica plan, or into hall and rooms in the Greek cross and other plans, but in all cases with ready access to the center and to the sanctuary in the apse. The Greek cross plan, which became standard in the Mid-Byzantine period, is essentially that of the basilica within. Its cross effect is more clearly defined without. Massive piers and subordinate arch systems on columns are the supports, sustaining barrel vaults, half-domes, spherical pendentives and domes. All of these structural principles were resolved by the 6th cent. (period of Justinian) and reveal the progressive solution of the problem of lodging a dome on a square base, marked by four mighty piers. Various experiments in this century were verified in Hagia Sophia. In St. George at Ezra in Syria, length of space was achieved by exedras built in the four corners of the central structure and by a vaulted bay interposed before the apse. In San Vitale at Ravenna open exedras about the cluster of piers granted space to the surrounding polygonal aisle and supported both gallery and cupola. In SS. Sergius and Bacchus at Constantinople the features of both were combined, whereupon they were extended dramatically by the interposed crowning hemicycles of half-domes and fully exposed pendentives in Hagia Sophia. From there to the present, Byzantine architecture has given these elements of construction rich and varied expression, and has been content.

Constructing a dome on a square is the familiar Byzantine achievement, and has been given technical analysis in reference books. One method had been to reduce the square to a polygon at the desired height by throwing horizontal courses across the corners of the square, and continuing the process until a

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

circle was approached on which the dome might be raised. This is a corbel system, and indeed the dome itself will be a corbelled one, ovoid in profile, and exerting vertical rather than lateral thrust by the nature of its construction of successive horizontal overlapping courses of rings of masonry and requiring height for safety as a consequence of the large number of rings of decreasing diameter.

A second method was that of squinches, arches of one sort or another spanning the corners of the square and affording a platform on which the circle base of the dome might be placed.

The third method was that of pendentives, i.e., spherical triangles. At first a dome with diameter equal to the diagonal of the square was conceived extending over and beyond the four piers of the square and supported on the piers, but with segments sliced off vertically over the sides of the square with resulting arches exposed, and leaving a flat dome above. This low dome and its pendentives are all a unit created out of the original true dome. It is the system employed in the tomb of Galla Placidia at Ravenna.

Hagia Sophia, however, presents us with dome on pendentives, the standard method ever since. The point to note is that here we have to do with two domes, the one (with diameter equal to the diagonal of the square) out of which the pendentives are formed by the vertical excisions and thereby affording the circular base for the second or true dome, the diameter of which is equal to the side of the square. The pendentives are all that are left of the larger dome, but being adequately buttressed by their substructures and supporting masses they are entirely competent to carry the thrust of the overhanging dome; a lateral thrust since the construction is by ribs (sometimes without centering, as in Persia today). Outside, the pendentives are covered by the four corners of the square, like a box. Presently a drum was interposed under the dome and over the box, and this became a feature of Mid-Byzantine and later periods, with varied provincial handling; esp. in the Balkan states and in Greece where on the exterior the drum is adorned with arched windows and arcades and the dome, usually small, snuggles down into the spandrels of the arches giving the pattern of the segments of a melon.

Domes presently began to increase in number, placed over selected masses; as on a second bay in the nave (St. Irene, Constantinople), over the narthex or additional aisles, over the four corners of the subordinate structure in the Greek-cross plan (Church of the Chora, Constantinople), and most effectively in the plan of cross with equal arms (Holy Apostles at Constantinople, St. Mark's at Venice, St. Front at Périgueux). In the Russian version of Byzantine architecture domes really did multiply.

Thrust likewise imposed new burdens on columns, such as they had never been required to carry before, and made the **Byzantine order** distinctive. The shafts were monoliths when possible, and of colorfully veined marble, but the popular Corinthian capital could not safely support the lofty weight now placed upon it. The result was the secondary capital or impost block, trapezoidal in profile, which first received the weight and directed it to the axis of the lower capital and shaft. The flowing leaves of the Corinthian capital were out of harmony with such pressure and accordingly they were folded close to the core (wind-blown acanthus), the tendency being to simplify the planes of the block and adorn them with the characteristic flat pattern designs of the current sculpture (basket capitals, melons, lozenges, etc.) consistent with the system of wall decoration with curious optic effects. Indeed it is scarcely possible to overemphasize the Byzantine scheme of interior decoration. It is a style which is entirely architectural, inseparably associated with wall and surface areas. Being abstract in content and technique it is a major element in the Byzantine synthesis. In many examples it presents a color range that is at once harmonious in basic atmospheric value of gold and purple, with a glory all its own, orientally subtle in intricate pattern, rhythm and color, optic in effect and with a strange suggestion of life remote and pertinent to itself. Yet it is under Greek control and displays refined and sophisticated taste.

Following the earliest Christian practice such decoration is confined to interiors, with which the exteriors, at least in the first period, are in striking contrast and yet contributing to the dramatic unity of the whole. Plain and unadorned outside walls, sometimes of rude materials, strike the eye and at one time were disparaged. We have been instructed, however, by the organized cubic volumes of our modern functional architecture, and are in a position to reappraise the exterior effects of Byzantine masses, whether formally organized or composed of coherent irregularities which, of course, are the more subtle. Perspective sil-

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

houettes are now the subject of frank admiration, together with their bold geometry. If one imagines triangular planes imposed over the sloping four sides of Hagia Sophia and converging on the axis the structure is realized as a hollow pyramid, sensational with its silhouette of curves.

Structure, of great boldness and coherence, is then, the primary exterior decorative principle. It is self-decorative, as was Greek architecture, but with different means. In the Mid-Byzantine period and later, exteriors were given a decorative treatment which is quite distinctive. Attention is given to materials. Fine stone masonry is a feature in Armenia and also at Athens, together with occasional sculpture designed in one plane. Courses of stone or marble in two colors are found, or bands of brick alternating with stone. Brick is laid in geometric patterns, zigzag, chevron, guilloche, etc., in continuous bands, as under the edge of a roof, over bases, and over apses. Doors and windows are recessed in the thick walls and members are enriched with geometric treatment. Blind arcades are engaged to the wall, and at times windows are grouped in twin lights or triple arcades, as are doors. In the use of arches the impost capital on slender shaft supports the segment of a pier under the spandrel, delaying the turn of the arch, with consequent impression of lightness. These and other decorations are found in Constantinople (St. Theodore), Salonika (Holy Apostles), and in Serbia and other Balkan areas. They belong mostly to churches of the Greek cross plan, which as a group are now highly regarded. They are preferred by some to the earlier style, because they express the Byzantine formula with full richness, leading the eye from lower masses with their domes and other shapes, to the visible arms of the cross, surmounted by its drum and dome.

Byzantine architecture took special form in the provinces, as in Coptic Egypt, and in Russia where it had independent development. It was taken over by the Moslems who had no architecture of their own, and who promptly rejoiced in its domes even if they comprehended little the subordinate masses. Furthermore, the style had powerful influence at times on the Western church. It is well known in Italy; Ravenna, Sicily, Venice and its suburbs, Milan and even Rome (St. Theodore). From San Vitale at Ravenna it was taken to Aachen by Charlemagne, with modifications; and its use in Spain and western France during the Romanesque period and before receives due notice (Oviedo, Périgueux, Angoulême, etc.). The style is alive today, not only in churches of the Greek rite, but in pretentious modern examples, such as Westminster cathedral in London, and in America where it has been appropriated by Jewish congregations for their more successful buildings. The principal modern modification is not in outward effect, but in means of construction. Steel frame can solve the problem of any dome.

Byzantine continues then, as one of the world's great styles in architecture, with a notable history of some 1500 years. It is both Eastern and Western, but is Greek in its essential being, and in its abstract quality. See N. L. Bréhier, *L'art byzantin,* 1924; H. C. Botler, *Architecture in Syria,* Princeton Expedition, 1899 and later; O. M. Dalton, *East Christian Art,* 1925; C. Diehl, *Manuel d'art byzantin,* 2 vols., 1925; J. A. BYZANTINE ART (6th cent. to the present). The term Byzantine refers to the art originating at or associated with Constantinople, the site of the ancient Greek settlement of Byzantium. The title which is therefore technical is convenient and is universally agreed to. It covers the art of the East Christian world, that is, of the Greek speaking section of Christendom with its affiliations. There is, however, considerable difference of opinion on the matter of when the title should first be used. Some begin with Constantine (324-337), founder of Constantinople and noted as a builder and decorator of churches; others with Justinian (527-565) also a famed church builder and art patron. Still others hold rigid views and prefer to reserve the title to the recovery of art after the Iconoclastic Controversy (8th and 9th cents.), and restrict the term to the style specifically organized at Constantinople and trace developments from the influence of the capital. In such case the period before the 9th cent. is variously called

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

Asiatic (Morey) or First Golden Age (Diehl) or Proto-Byzantine. This sketch will begin with the 6th cent. since essential elements in the style are present in the age of Justinian.

Byzantine is an art of great distinction, power and tenacity. Like Egyptian, it is an art of formulas, and like Egyptian formulas are used for calculated purposes, not academically. It therefore attains great monumentality and is perhaps the greatest abstract art that men have ever created. Its consistent purpose is to present in visual terms an order of experience with a range of ideas pertaining thereto, heavenly, saintly or secular, which is utterly remote from actual circumstance and accordingly abstracted for such satisfactions as men may obtain from contemplating it. The satisfaction is immense for the art responded fully to the desires of its times and of its people. It is social in this respect and has a history unmatched in Christendom. Materials of utmost richness are employed for such purpose. The media then are mosaics, frescoes of high color, miniature and panel paintings (icons), ivories, enamels, jewels, textiles and objects of use. There is very little sculpture in marble, especially after the dispute about images. There is such an abundance of created objects that only selected references can be made in the following account.

Byzantine art combines Greek and oriental ingredients in style, technique and thought processes. The oriental contribution consisted in rich color harmonies particular to the Near East, organization by rhythmic accent and the sense of movement occasioned thereby, flat design with occasional vertical perspective, and in general the decorative principle. The East also contributed its characteristic mode of regarding both sensory and non-sensory phenomena as remote vision partaking of the nature of mystery and not subject to analysis but rather as the object of contemplation. Here the Greek mind made contact and under Christianity resolved the generality of supernal mystery into a series of concepts which invite the utmost effort in intellectual analysis. The Church had organized its dogma after some centuries of precise thinking and society had organized its institutions. Such was the material presented to the artists. Their task was to constitute these concepts in visual form, create in the visual arts equivalents of abstract dogmas (and also functions of the "apostolic" emperor), and display them both for contemplation and for intellectual stimulation, and in so doing afford pleasure to the eye and enrichment to the soul. Thus purposes implicit in Greek art, dissipated in the Hellenistic period, are recovered in their purity and under the inspiration of Christian faith, which supplied in its doctrine ideal concepts unknown to the ancient Greeks, attain a climax in Byzantine style of the 10th to 12th cents. Byzantine is thus the consummation of Greek art.

It is evident that in Byzantine we have to do with applied art. Technique is consciously applied for determined purposes, the creation of abstract concepts. It is therefore very intellectual both in the nature of the reflective thinking which supplied the requirement and in the technical processes by which the purposes were realized. The style is accordingly non-realistic, in environment, in figure and in episode. Environment is non-spatial, in one plane of no depth, with no recognition of perspective (save the vertical) and no atmosphere. It is all color, preferably gold, with obvious suggestion of the light of heaven. There are of course no cast shadows. Even the rich color of ivory is agreeable with such interpretation of environment. The figure is effectively distorted in characteristic ways. It tends towards the flat, although in the great period Greek sense of form is recovered with dignity and clarity. But ordinarily one sees gorgeous costume above which are outlined heads with strange staring eyes, and to which curiously distorted hands and feet are attached. Construction is by line and color within contours, and costumes at times become web, the patterns of which refer to the rhythmic folds of classic drapery and maintain a reminiscence of chiaroscuro. This formal denial of organic relation of costume to figure is strangely effective. In appropriate instances the pose is frontal, in immobile isolation, with powerful suggestion of monumentality.

In episode distortion becomes a virtue of high order. In some instances it is calculated with refined subtlety. Such distortion is expressive for its purpose, since it declares the significance of scene rather than the portrayal of it. Mutual relations are registered in one plane, and poses and gestures are formal. Movement is that of stately rhythm and takes place in the eye of the observer. Accessories are merely indicated, such as summary architectural data or foliage to suggest locality, though they hold equitable place in the pattern being in no wise subordinated.

From this account of characteristics of the style it appears then that whether we see episodes in the life of Christ or other narra-

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

tive from the Scripture, great visions from the Apocalypse or from the ecstasies of the prophets of Israel, events in the lives of the apostles, saints and martyrs, the ceremonial dignity of the "sacred" *basileus,* nobles of his court or high ecclesiastics, in all cases we have the display of spectacle, rich in color and in materials, signifying a very special sort of experience, sensationally different from that of daily circumstances, remote, isolated and abstract. The style is indeed non-realistic unless we say that it makes vision real. Certainly it does all that art can do to intimate the realities of the heavenly world and indeed the essence of Christian experience of life in this world. The persons of the Trinity, angels, the Madonna, apostles and saints condescend by the aid of art to display their heavenly felicity and their abstract significance.

A few examples will serve to illustrate the above interpretation. The procession of martyrs holding crowns in their hands, is created in mosaic on the nave walls of *S. Apollinare Nuovo* at Ravenna (6th cent.). It is gorgeous in color, unnaturalistic in figure and is non-pictorial, but it is superb rhythmic decoration. It is not a picture of a procession, such as is afforded by the technique of illusionism in the documentary records of the triumphal parade in the Arch of Titus or the procession of dignitaries of the Altar of Peace at Rome. The parade of the martyrs is abstracted, and the sense of significance remains. In this respect it is like the procession of the Parthenon frieze, although the principles in design and organization are different.

The ivory panel of Christ bestowing crowns on the imperial couple, Romanos and Eudoxia (11th cent. Paris, *Bibl. Nat.*), constructed with complete mastery in technique is an assured abstraction of the concept of divine authority in imperial government. The panel of the Madonna and Child (11th cent., Utrecht), superbly wrought in ivory, declares the doctrine of the Incarnation. Nowhere is there a more impressive picture of the crucifixion than the mosaic at Daphni (11th cent.). The figure is realized with simple grace against no background save that of color. The mother and St. John are in formal balance. There is no environment or indication of time and place. From such categories the passion is abstracted, wherefore the divine sacrifice is made eternal and the Christian doctrine of redemption is offered to men for their contemplation. The effect is overwhelming. But it should be observed that Byzantine mosaics must be seen at first hand, as indeed frescoes and all mural decorations. No reproductions in color can possibly give the effect. Byzantine mosaics are an authentic instance of the necessity of "exposing" the observer to the original material. Likewise it must be remembered that mosaics are associated with architecture, and their truly Byzantine function in this respect is illuminating. They mask walls, whether domes, semi-domes, pendentives or other areas, and practically deny the nature of the wall as well as of all structural supports. They make even architecture abstract, and leave nothing but experience, a rare experience indeed, especially when one includes music and the liturgical celebration.

The history of Byzantine art may be sketched as follows: The style was constituted upon the basis of experiments in East Christian art which attained a synthesis in the 6th cent. Chief examples are at Ravenna, seat of Byzantine government in Italy (*S. Vitale, S. Apollinare Nuovo*) and at Rome (*SS. Cosmas and Damian*). Mosaic is not an effective medium for chiaroscuro, and when such realistic effort was renounced in favor of flat plane and rhythmic accent, as well as rich and subtle color, a truly monumental style resulted. The oriental ingredient consisted in this decorative principle, whereas the Greek was that of figure and the underlying reason. Miniature painting is represented by the *Gospel of Sinope* and the *Gospels of Rossano,* in which the earlier struggles persist. Miniature is an intimate medium, inviting innovation and experiment, and the tendency in these paintings to reduce the planes to conform to non-spatial flatness results in obvious stringency.

The first period terminated in the Iconoclastic Dispute about art inaugurated by the Emperor Leo III in 726, and preceded by the rise of Islam with its non-representational art and the Arab conquests which removed Egypt and North Africa, Palestine and Syria from the Christian world. There were appropriate consequences: a loss of oriental influence, including Persian; heretical churches on the borders of the Empire no longer made demands; Constantinople was the acknowledged center and its influence extended more powerfully into Greece and the Balkan states, and also into Russia ( the conversion of Russia was the sole important missionary exploit of the Greek Church and in this art was very influential) ; the orthodox theology and indeed the civilization of the area was reassessed and confirmed, and the culture was now overwhelmingly Greek. An especially significant phenomenon was the flight of Christians from

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

Alexandria, to Constantinople, to Sicily and to Italy, bringing Alexandrian style with them.

Recovery from all this resulted in the Mid-Byzantine style (with which some first recognize the art), or the true Golden Age, as others characterize it. It is essentially a meeting of the Alexandrian style with earlier Byzantine, with oriental elements restrained and Greek enhanced. New attention is given the figure which attains great nobility, and in miniature painting, such as the Paris Psalter, there is poetic realization of landscape. The 10th, 11th and 12th cents., are the great period. The decorative principles and the color sense and the organization of color accents into webbing are of oriental source, the figure, constructed at times with distinguished clarity and always with significance, is Greek, as is the trace of chiaroscuro and a certain freedom in modelling. The best examples in mosaic are at Daphni. The mosaics in Sicily are very well known. Some of the mosaics of St. Mark's at Venice belong here, as also Torcello. In recent years mosaics of *Hagia Sophia* at Constantinople have been uncovered. This is the supreme period for Byzantine ivories, for the best in miniature painting, and indeed for all media.

The purity of the style could not be maintained. The rhythm became mechanical, the iconography became static with the academic organization of formulas, and creative energy turned to drama, to excessive distortion and to sundry eccentricities. This period covers the 13th and 14th cents., and later. Examples are in sundry Balkan states and in Crete (whence came El Greco), with extended influence in Russia, where native vigor made it a truly Russian art. Here may be cited mosaics at Kahrie-Djami, Constantinople, noted for color, paintings at Mistra, Mount Athos, and in monasteries in Serbia and other Balkan states, which, however, are largely in fresco. This is an era rich in panel paintings (icons), and of course the illustration of books continues.

In Italy the style is known as Italian-Byzantine, and is basic in the school of Siena, modified by the grace of Duccio, until connection is made with Gothic. In Florence it is sharply renounced by Giotto. It continues to the present as the official art of the Greek Church and its national subdivisions and very effective examples of recent date are in the memorial chapel of the late king of Jugo-Slavia.

Byzantine style is thoroughly sophisticated, and is the reasonable expression of a learned culture which rejoices in intellectual exercise, and is content therewith. It reveals why the Greek section of Christendom remained static, untroubled by reformation movements and the progressive energies of the West. It required no recovery of antiquity since it possessed the true Greek heritage and took it for granted.

The perplexity of the barbarians of the West in their contact with and attempted use of Byzantine style is clarifying in this respect. Barbarism had destroyed the technique of Alexandrian illusionism in the West, together with all examples. Yet illusionism, the art of a practiced technique, gives pictures of visible reality, which the barbarian can see and understand but cannot create. Byzantine style is flat and in this respect is akin to the flat, linear, non-realistic usage of barbarians. The barbarians then could follow the formulas of Byzantine style but could not possibly understand the intellectual processes responsible for them. They were in a dilemma. What they could do they could not understand, and what they could understand they could not do. This is one reason why the art of mediaeval Europe is fascinating as well as bewildering. See O. M. Dalton, *Byzantine Art and Archaelogy,* 1911; C. R. Morey, *Medieval Art,* 1942; D. T. Rice, *Byzantine Art,* 1935; E. W. Anthony, *History of Mosaics,* 1935; C. Diehl, *Manuel d'Art Byzantin,* 2 v., 1925 and *La Peinture Byzantin,* 1933. —C.D.L.

**Byzantine chant.** See MEDIEVAL MUSIC; eastern chants.

**Byzantine music** is the music of a semi-oriental people, for the Eastern Roman Empire was for centuries the meeting-ground of the East and the West. It was a very ancient musical heritage antedating the Christian era.

Many of the pagan ecclesiastical customs were not renounced when the Greek world gave up the worship of its ancient gods for the new faith. Music held one of the highest places in the educational system of the ancients, and the early Christians (Byzantines) conserved and saved that music in their religious worship. The pagan rhythmical, so-called Greek music, was introduced in the churches by the first Apostolic Fathers. The ecclesiastical hymnographers of the first centuries of the Christian era based their art

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

upon the same intricate rhythmic patterns. Greek and occidental historians accept the technical arrangements of the ancient Greek music as the basis of the early Christian ecclesiastical modes.

Byzantine music is modal, divided into four authentic and four plagal; it is homophonic and employs both quarter tone and third of a tone. There are three general classifications: (1) *papathika,* which is florid and highly embellished; (2) *stihirarika,* our equivalent of which is andante and maestoso; (3) *ermologika,* our allegro and allegro vivace. It has its own notation (see NOTATION), originally stenographic—one sign expressed an entire melodic pattern. Today the notation is comprised of ten neumes, these neumes are used either simply or in combination to form a new note. Byzantine music, the inheritor of ancient Greek music, is the official liturgical music of the Eastern Orthodox Church throughout the world. —C.V.

# C

**Cabiri** (Gr. Kabeiroi). Early Greek nature deities (two male and two female) worshipped especially on the islands of Samothrace and Lemnos and in Thebes in Boeotia with mysterious rites, second only to the Eleusinian mysteries in popularity in Roman times. —L.T.S.

**cabochon** (F.). An unfaceted cutting for gems, used almost universally in Oriental jewelry.

**cabriole.** A double-curved furniture leg, used widely from the late 17th cent. on. See FURNITURE.

**caccia** (chace). See MEDIEVAL MUSIC.

**cachucha.** A Spanish national dance of the Iberian group, recorded as being a species of sequidilla in triple time. Unlike most of the sequidilla type, it has virtually disappeared from popular performance, many of the steps having been incorporated into newer dances, variously named. The cachucha is remembered especially in connection with Fanny Elssler, the great 19th cent. ballerina who used many cachucha steps in one of her most famous dances. See sequidilla. —J.G.

**cacaphony.** *Mus.* Extreme discord.

**cadence.** Arrangement of musical elements made in order to emphasize the termination of a phrase. If an idiom (q.v.) is used over a sufficient length of time, certain types of cadence formulae become standardized, e.g.: in modality, typical approaches of one or more voices to the final (raised leading tones, sets of suspensions and alternating tones, etc.); in tonality, typical chord progressions, classified according to their faculty of creating finality, such as authentic c. (dominant-tonic), plagal c. (subdominant-tonic), half-cadence (ending on the dominant), deceptive c. (substitution of another chord for the tonic in the authentic c.), etc. (see idiom). Cadential effects are enhanced by suitable metrical arrangements. —E.K.

**cadenza** (It.). *Mus.* Literally, cadence. (1) A fantasia for display of virtuosity, played by the soloist just before the cadence of the first or last movements of a concerto, or an elaborate melismatic passage sung just before the cadence of an aria; in the nature of an extemporization though usually composed; based largely upon themes previously used. (2) In shorter compositions, short brilliant solo passages of unmeasured rhythm.

**cadmium pigments.** These comprise a range of colors from deep red to pale yellow. All are in some way sulphides of the element, cadmium. Differences are partly from addition of other elements and partly from conditions of manufacture. Commonly, these pigments are made by precipitating solutions of a soluble cadmium. Cadmium red contains some selenium. There is a group of colors known as the cadmium lithopones in which the pure cadmium is adulterated with barium sulphate precipitated with it. These have a slightly lower tinting strength but are otherwise not impared. All cadmium colors are of recent origin so far as their general commercial distribution is concerned. They are said to have been shown in the 1851 exhibition in London. Early in the manufacture of cadmium yellow some excess of free sulphur made it incompatible with many other pigments. That is corrected in modern production of this and the other cadmium colors. They change slightly when strongly heated but are, in normal temperatures, stable and fast to light. —G.L.S.

**Caeretan hydriae.** See Ionian vases.

**Cahokia Mound.** A huge mound near the center of an area, near East St. Louis, containing 85 mounds. It is a truncated pyramid with a terrace, rectangular in plan, measuring c. 700 x 1000 ft., 100 ft. high and covering 16 acres. It is the type of mound that served as a base for a ceremonial building. It is also called the Monks' Mound, from a Trappist monastery built in 1809 at its base. The area now constitutes the Cahokia Mounds State Park. See Eastern North American Aboriginal Art. —H.G.

**cairn** (Gael.) Rounded heap of stones as a monument to the dead.

**caitya** (Skr.). Buddhist sanctuary. Particularly a chapel hall, as the caitya halls of Ajanta. See INDIAN ART.

**cakra** (Skr.). See Wheel of the Law.

**calcography.** Drawing with chalks or pastels.

**calefactory.** See monastic architecture.

**calico.** Named from Callicut, a great trading center of India. Plain weave, it is one of the earliest cotton fabrics. Ancient Indian calico was printed with wood blocks. Calico is sometimes plain color or printed in colors. Printing of cotton calico started in London in 1676. First calico made in the U. S. A. in 1790, by power machine in 1826. A general term for calico up to the end of the 17th cent. —G.W.R.

**California Indian art.** The diverse topography of California tended to break the tribes into small units, while the climate and the ready availability of food made living easy. Conditions of life were in sharp contrast with the harsher ones of the broader and more unified areas of the Southwest. There were numerous small independent tribes, in general hunters and fishermen, and gatherers of the abundant acorns, nuts and seeds. Though sedentary they were not agriculturalists. Except for their elaborate ceremonials and for some stone jars and small stone carvings of sea creatures showing exceptionally fine feeling for simplified sculptural form which were made by the Gabrielino and Chumash tribes of the southwestern part of the state, the chief art expression was utilitarian: containers for storage, cooking and serving, transporting, berry and nut gathering. It was an art practiced by the women alone, who attained an unsurpassed level of form and technique in astonishing variety. Materials were abundant: roots, stems, bark, grasses and rushes. Both coiling and twining techniques were used. Styles vary with the different tribes. The more important wares were produced in the central and northern part of the area. In the former, north of San Francisco Bay lived the Pomo, the virtuosos of the craft. The even texture of their baskets exhibits an amazing technical facility in both coiling and twining. In shape they are frequently flattened bowls; in size they vary greatly, from a few inches to several feet in diameter. Their designs, black or brown on tan, tend to triangular or rectangular motifs in diagonal or horizontal arrangement. An unusual feature is the frequent application of many colored feather ornaments. In the north the Yurok, Karok and Hupa produce finely twined baskets in red or black on white, or white on brown. Among the decorative motifs used, triangle and zigzag predominate, frequently arranged with a diagonal movement. See F. H. Douglas, *The Main Divisions of California Indian Basketry,* Denver Art Museum Leaflets 83-84, 1937; A. L. Kroeber, *Handbook of the Indians of California,* 1925; O. T. Mason, *Aboriginal American Basketry,* 1902. —H.G.

**calligraphic styles, the five Chinese.** See CHINESE ARTS.

**calligraphic.** (F. *calligraphie;* 1. *calligraphia;* adaptation of Gr. *kalligraphia,* substantive of quality from *kalligráph-os, kállos* beauty — *gráphos* writing, writer, written. 1613 R. Cawdrey. *A table alphabeticall of English wordes.* ed. 3. *Calligraphie,* faire writing.) Beautiful writing as a product, also elegant penmanship as an art or profession.

Calligraphy is distinguished from writing only by its fine quality, hence in general the term may be applied to writing (q.v.) which shows excellence in design and execution in any of the three categories and of any period. In a more restricted use, the term is frequently employed to refer to the art and product of professional writing masters in Europe and America from the 16th to the 19th cents. Specimens of their work appear in the copy-books produced as models for students of handwriting. The earliest of these manuals, that of Ludovico degli Arrighi, also known as Vicentino, which appeared at Rome in 1522, gave a specimen of a semi-formal script, the chancery hand, with instructions for learning to write it. The later 16th cent. writing-books showed

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

specimens of a similar script, sometimes with additional examples of the contemporary formal and cursive hands, both gothic and roman. In this century, however, the emphasis was on the semi-formal scripts for diplomatic and legal purposes. In the 17th and 18th cent., with the increase of commerce in France, Holland, and England, the cursive gothic hands gradually disappeared and the writing manuals show model scripts for business purposes, based on roman forms and much more cursive in character than their predecessors. In these hands open loops gradually replaced the former ascenders with serifs, until in the 19th cent. the usual hand of the copy-books had become the form popularly called "script", of which the typical, although scarcely calligraphic, example in America is the Spencerian hand. Most writing masters from the 17th to the 19th cent. included in their books specimens of ornament and drawings of animals, birds, etc. composed of pen-strokes and done by **command of hand**, i.e., with the pen lines written directly and freely without preliminary drawing. In the 20th cent. there has been a revival of calligraphy in the field of formal and semi-formal writing. The movement began in England with the teaching of Edward Johnston and was continued in Germany by Rudolf Koch and others. See WRITING and LETTERING; CHINESE ARTS; also A. Fairbank, *A Handwriting Manual,* 1932; P. Jessen; *Meister der Schreibkunst,* 1923; E. Johnston; *Writing and Illuminating, and Lettering,* 1906; S. Morison, *The development of handwriting,* in A. Heal, *The English Writing Masters and Their Copy-books,* 1931; R. Nash, *Some Early American Writing Books and Masters,* 1943. —E.F.D.

**calliope.** A mechanical organ with keyboard by which tones are produced from a series of steam whistles; used in carnivals and on river boats.

**calyn crater.** See crater.

**camaieu.** Painting in monochrome.

**camaak.** A heavy silk fabric.

**cāmara** (Skr.). See fly-whisk.

**camarin.** Domed chapel of the central type in Mexican pilgrimages churches (also Guatemala) usually immediately behind the apse and communicating with it by a window-like opening in which the cult image stands. Often also the repository of the jewelled wardrobe of the cult virgin. —J.McA.

**Cambodia art.** See INDIAN ART; SOUTHEASTERN ASIATIC ART.

**cambric.** Named after the French town, Cambrai, where it was first made. A fine cloth, originally linen, now usually cotton; a plain weave. —G.W.R.

**camelaucum.** See tiara, papal.

**camel hair.** See brush.

**cameo.** See JEWELRY.

**cameo-glass.** Two pieces of colored glass fused together, the outer glass area being carved in outline and detail, thus showing in relief against the other. —J.A.M.

**camera lucida.** A comparatively modern development of the camera obscura, this is a prism set in such a way as to deflect the image of an object and throw it on to a paper where it can be traced. It is listed by artists' colormen as early as 1848 and probably was in use somewhat before that. —G.L.S.

**camera obscura.** The reflection of an object on to a surface where it can be traced or drawn is effected by this apparatus, as it is with a camera lucida. A camera obscura is larger and does not depend on a prism. It can operate with a mirror and some kind of a double convex lens. It is said to have been invented in 1540. —G.L.S.

**Cameroon art.** See AFRICAN NEGRO ART.

**camlet.** A type of plush.

**camp** (Fr. *camp,* early 16th cent.; L. *campus,* field; Middle English used only *champ*). The place in open country where a body of troops is temporarily lodged in tents or makeshift structures, with or without entrenchments. In modern usage the term is also applied to a permanent station for the training of troops in the methods and duties of the field campaign, and includes all the buildings, tents, and equipment pertaining thereto. A secondary modern meaning is an informal house or lodge or assemblage of accommodations for the occasional use of hunters and fishermen. The term is also applied to certain of the ancient earthen fortifications of which traces remain in Britain. —T.A.H.

**Campā.** See SOUTHEASTERN ASIATIC ART.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

**campana, campanetta.** A bell.

**campanile** (It.). Bell tower, frequently free-standing.

**campo aperto.** See MEDIEVAL MUSIC.

**campo santo** (It.). Cemetery near a cathedral.

CANADA, ARCHITECTURE OF. The French Colonial architecture of Quebec is based on the 17th cent. building traditions of northern France. The first houses were of wood, framed and boarded. Such were the *habitations* built as trading-posts by the early explorers (Des Monts' habitation, Port Royal, 1605; Champlain's habitation, Quebec, 1608). But stone was abundant and though wood never went out of use, by about 1675 stone was in general use. Climate and living conditions modified the original tradition and produced a true Canadian architecture, simple but of great charm. In the woodcarving of the churches indeed it rises to high distinction.

The earliest houses now remaining (Batiscan presbytery 1696, Ferme St. Gabriel 1698) have sturdy stone walls and heavy shingled roofs with a slight bellcast. The plan is rectangular and compact; the roofs are large, often twice the height of the walls, and are gabled or hipped in the French *pavillon* form. (Villeneuve House, 1684, Baie St. Paul Manor, 1718.)

A distinctive type, with stone gable parapets surmounted by double chimneys, is common in and near Montreal. This is derived from the town house in which the parapets served as fire partitions. (Chateau de Ramezay, 1704.)

The curved bellcast, wide-spreading eaves and verandah gallery of the Quebec cottage seem to have been introduced about the end of the 18th cent. They apparently came from the French settlements of the Mississippi valley, which had learnt them from the Spanish settlements of the Gulf.

Skilled craftsmen were amongst the earliest colonists; in a procession held in 1648 twelve trades were represented. In addition, about 1668, an *École des Arts et Métiers* was founded in the Seminary. Here not only the trades were taught but also the arts of architecture, painting, sculpture and gilding.

The panelling in the refectory of the Hôpital Général (1674) and the fine staircase in the Ursuline Monastery in Quebec (1686) show the skill of these craftsmen. They trained apprentices who carried on the tradition. The panelling of the Fargues House (1781), of the Briand chapel in the Seminary (1785) or of the Community Room in the Ursuline Monastery in Quebec, show a continuous tradition of fine design and workmanship.

The earliest existing churches date from about 1730. They are oblong halls terminating in a square or semicircular sanctuary. The roofs are steep, often covered by "tin tiles" which weather to a fine bronze colour. Over the west gable is an octagonal belfry surmounted by a slender flèche.

The sanctuary is fully decorated with woodcarving. Usually it has an architectural framing of Corinthian pilasters enclosing panels of trophies, fruit and flower garlands, niches and statues. The general style is that of Louis XIV or Louis XV but with the freedom natural in a colonial style. Such work was done in French Canada as late as the middle of the 19th cent.

In 1690 Jacques le Blond de Latour, an architect, sculptor and painter of Bordeaux, was teaching sculpture in the Seminary, and in Montreal Charles Chaboillez and Paul Jourdain dit Labrosse, French woodcarvers, were working in 1701. From them descend the great woodcarvers of the 18th and early 19th cents., the Sieurs Vasseur, Pierre Emond, the Baillargé family, Louis Quevillon and his associates and many others whose work is to be found throughout the province.

The leading woodsculptors were men of social standing, trained artists and skilled craftsmen. In their work the Grand Manner came to Canada; it is possibly the greatest achievement of traditional art in North America.

The old architecture of the Maritime Provinces is mainly New England Georgian, delicate in detail and proportion, showing clearly its derivation from the school of Robert Adam. Mount Uniacke, near Halifax is a high columned "Colonial" mansion, Acacia Grove in the Cornwallis Valley, is a fine square brick house, Matlock has a good ionic portico of the Greek revival. In Halifax the Governor's House and the Legislative Building by John Merrick, show an English flavour and remind us that men trained in English offices came to Canada in the early 19th cent., many of them attached to the military or naval services. The fortifications of Ile aux Noix or of Fort Henry at Kingston

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

show that the Royal Engineers of that day were competent architects as well as military engineers.

Many of the smaller towns in Southern Ontario retain good houses of the late 18th and early 19th cents. The church of St. Andrew at Niagara, built about 1831, is particularly fine and we should mention the Town Hall at Kingston, a classic work of almost brutal strength.

The delicate art of the early 19th cent. could not withstand the rapid expansion of the 50's. The old traditions died and the need for architects was supplied from external sources. It is only of recent years that Canada has begun to train her own architects and for the greater part of the 19th and the early 20th cent. Canadian buildings are English, American or French rather than Canadian.

To take a few instances, the Canadian Pacific offices in Montreal are of Richardsonian Romanesque, the big railway hotels, in the style of François Premier, are named *chateaux* in compliment to our French Canadians, that at Quebec has even been taken for an ancient relic of the French Regime. Many Canadian architects received their training in the U.S.A. and returned to bring to Canada the American version of the *Beaux Arts;* others, trained in England, gave Canada fine buildings in the manner of Pugin, Cockerell, or Norman Shaw. Canada has many fine and dignified buildings, is thoroughly cosmopolitan, but has hardly got a Canadian architecture.

The East has her old traditions, the West her new aspirations. Time alone can unify Canadian arts and give us some day a true Canadian architecture. —R.T.

**CANADA, ART OF.** (1) *Aboriginal Art.* The development of art among the native tribes of Canada was handicapped by the hardships of a semi-nomadic existence in a rigorous northern climate. Prehistoric artifacts of artistic significance are few and fragmentary, and it is difficult to determine exactly how far the Indians had progressed artistically before the coming of the white men. Due rather to unfavourable circumstances than to lack of ability, their work appears to have been restricted to decorative crafts and small carvings. Among the crafts known to have been practiced by them in prehistoric times are the making of pottery with incised decorations by the tribes of the St. Lawrence basin, the carving and engraving of walrus ivory by the Eskimos, and the carving of rattles, masks, and other small objects in wood by the Indians of the Pacific Coast.

Most of the existing art of the Canadian Indians dates from the centuries following the discovery of the continent by white men and was directly or indirectly an outgrowth of white influence. Contact with Europeans gave the Indians hard metal tools, new sources of wealth resulting from the fur trade, and in some cases a European demand for their artistic products. These circumstances stimulated the latent artistic powers of the natives and resulted in a widespread flowering of Indian art. The Algonquin tribes of the eastern and central areas, for instance, developed an elaborate art of embroidery both in porcupine quills and glass beads. This art, skillful in craftsmanship and often charming in design, has been shown by Dr. Marius Barbeau to have been influenced by, and perhaps established as a result of, contact between the Indians and the trained European embroiderers of early French Canada.

Only on the Pacific Coast did the Indians of Canada press beyond decorative crafts to achieve art on a monumental scale. Here a milder climate and a more abundant food supply—the latter encouraging a relatively settled existence — occurred in conjunction with stimulating sources of raw material such as giant cedar forests and a deposit of black argillite, an attractive easily carved stone. Even with these advantages, West Coast Indian art reached maturity only after the Indians had received metal tools and surplus wealth from white traders. When all these circumstances finally converged, an incipient genius for carving suddenly blossomed into sculpture that constitutes one of the highest achievements of aboriginal art in Canada.

This sculpture first appeared about 1820 in the form of small **argillite carvings** of animate and inanimate forms. Although produced by the Indians for sale to the whites, many of these carvings are impressive both in sculptural design and vitality of expression. Outstanding among their makers were several members of the Edensaw family of Massett, Queen Charlotte Islands.

A decade after the first argillite carvings, that is to say about 1830, the carving of immense cedar logs into **totem poles** began its spectacular development. These totem poles, an outgrowth of the smaller frontal poles used at the entrances to plank houses, served a double function. They were monu-

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

ments commemorating deceased nobles and also heraldic symbols of family pride and succession akin to European coats of arms. At their best they are imposing sculpture—monumental in size, rhythmic in design, awe-inspiring in imaginative conception.

West Coast sculpture was as short-lived as it was significant. By 1890 it had fallen into decline, crushed by the impact of the same white civilization that had stimulated its development.

Worthy to stand with West Coast sculpture at the summit of Canadian Indian art are the splendidly decorative **Chilkat blankets** woven of mountain goat's hair and cedar bark. These blankets originated on the Queen Charlotte Islands, but reached perfection in the hands of the Chilkat tribe on the mainland. Their unique patterns are based on the principle of dismembering natural forms, stylizing their component parts, and recombining them symmetrically in abstract relationship to each other; a type of design which in some respects anticipates 20th cent. European cubism.

Jenness, *The Indians of Canada,* 1932; and the following bulletins of the National Museum of Canada; H. I. Smith, *An Album of Prehistoric Canadian Art,* 1923; M. Barbeau, *Totem Poles of the Gitksan, Upper Skeena River, B. C.,* 1929.

(2) *French Colonial Period.* In the light of the foregoing paragraphs, the reader will not be surprised to learn that the first French Canadian art dates from two centuries earlier than the mature West Coast Indian art discussed above. Beginning with settlements at Port Royal, Nova Scotia, in 1605 and Quebec in 1608, French colonization spread through two chief areas: Acadia on the Atlantic Coast and New France along the St. Lawrence River. The material culture of the former area was virtually annihilated when the Acadians were expelled by the English in 1755. As a result, surviving examples of French Colonial art come almost exclusively from New France, now the Province of Quebec.

Like medieval Europe, the French Colonial period devoted its major energies to decorative arts rather than to painting, uniting a variety of crafts in the service of the Catholic church. Its governing purpose was to provide a resplendent setting for religious ceremonies; a setting to which the embroiderer or "tapestry maker," the wood carver and gilder, and the worker in precious metals all contributed. Domestic arts and crafts were also practised, but it was religious art which particularly characterized the period.

The active history of French Canadian art may be said to date from the founding of the Ursuline convent in Quebec in 1639. Several of the nuns of this order were zealous practitioners and teachers of embroidery. Altar frontals, chasubles, and other church vestments engaged the chief energies of these devoted seamstresses. Gold and silver thread, combined with colored silks and sometimes enriched with semi-precious stones, gave their work a truly medieval magnificence. Among the leaders of the craft were Mother Marie de L'Incarnation (active 1633-71), the saintly Jeanne le Ber (active 1686-1714), and Mother Sainte-Helene (active 1714-59).

Interesting interaction of French and Indian traditions is shown by the fact that for reasons of economy the nuns sometimes embroidered with porcupine quills and dyed moose-hair secured from the Indians. Conversely, the rhythmic arabesques of the French floral patterns are believed to have inspired most of the decorative designs found in Indian embroidery.

About 1675 Msgr. de Laval, first bishop of Quebec, founded the first art school to be established in the New World: the *Ecole des Arts et Metiers* at Cap Tourmente, about thirty miles below Quebec on the St. Lawrence. The master craftsmen imported from France to serve as teachers at this school exerted a strong influence on the subsequent development of French Canadian art.

One outcome of Laval's initiative was a long line of French Canadian wood carvers and sculptors dedicated to the service of the church. Beginning with le Blond de Latour one of the original group of craftsmen who immigrated to Cap Tourmente, this line was still active two and a half centuries later in the person of Louis Jobin, who died as recently as 1928. These and several scores of intervening masters gave solicitous care to the decoration of altars, reredos, tabernacles, and other church fittings. Wooden statues of the Madonna and various saints also took shape under their chisels, to be finished with the brushes of the painter and gilder. The work is sometimes elegant, sometimes florid. Occasionally the sculpture is touched with real depths of expression, as in the fragments of a reredos at Les Eboulements.

As may be expected, Quebec silversmiths devoted their best efforts to the production

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

of chalices, monstrances, and other church silver. Outstanding among the masters of this craft were Paul Lambert (1691-1749), Francois Ranvoyzé (1739-1819), and Laurent Amiot (1764-1839). Elaborately embossed ornamentation and fine simplicity of line can both be found in their work, the best of which compares favorably with American colonial silver and with contemporary silver from the Old World.

Students of period design can recognize in all the products of these several arts gradual changes of style following at a distance the influence of successive periods in Europe. The earlier work shows the influence of the contemporary French school of the period of Henri IV. This eventually gives way to more florid forms indicating Baroque influence, the latter in turn to be succeeded by Neo-Classic.

Important collections of early French Canadian art can be seen in Quebec City at the Ursuline Convent, the Hôtel-Dieu, and the Hôpital-Général; in Montreal, at the Hotel-Dieu, the Museum of the Church of Notre-Dame, and the Congrégation of Notre-Dame. The Indian missions at Indian Lorette and Caughnawaga also possess outstanding collections.

Traquair and others, *McGill University Publications, Art and Architecture,* Series XIII, Nos. 1-37; G. Morriset, *Coup d'Oeil sur les Arts en Nouvelle France,* 1941.

(2) *From the British Conquest to the Present Day.* The conquest of Canada by the British in 1759 coincided approximately with the transition between two fundamentally different cultural epochs. As already noted the traditions of New France, like those of 17th cent. New England were essentially mediaeval in character. After the Conquest the main currents of Canadian culture shifted their direction. The influence of the Renaissance and the Industrial Revolution replaced that of the Middle Ages. The unity of the arts which had resulted from a controlling framework of religious architecture disintegrated; hand crafts retreated before machine production to maintain a precarious existence in rural areas, and easel painting, the art of individualism, emerged as the dominant form of artistic expression. For the next century and a half the history of creative development in Canada was largely a history of painters and painting.

The early stages of this trend are to be seen, between 1770 and 1840, in the work of the so-called "topographers": English military officers and civil administrators who sketched Canadian landscapes either in connection with their official surveys or as a diversion for their leisure hours. Their work is usually classed as Canadiana and can be seen in public archives, both national and provincial, as well as in the imposing Coverdale Collection of the Manoir Richelieu at Murray Bay, Quebec. Done for the most part in drawing or water color, the work of the topographers was sometimes given wider circulation through the medium of engraving or lithography. Currier and Ives, as well as other publishers, drew upon it for Canadian subjects. As representatives of the school we may mention Lt.-Col. J. P. Cockburn (1779-1847) and W. H. Bartlett (1809-1854). Bartlett's *Canadian Scenery* (1842) ranks among the best productions of the period.

The topographical beginnings of painting in Canada merged almost imperceptibly into the work of the country's first professional painters: Paul Kane (1810-71) and Cornelius Krieghoff (1812-72). Kane was Canada's chief pictorial chronicler of the Indians. As recorded in his book, *The Wanderings of an Artist,* he made an epic journey across Canada to record the Indian scene in the then unsettled west. Inspired in manner by English historical painting of the 18th cent., Kane's work is dignified if somewhat constrained in effect, and constitutes a valuable record of the aboriginal life that was soon to be undermined by the advance of white civilization. The bulk of it is now at the Royal Ontario Museum in Toronto.

Krieghoff, though contemporary with Kane, differed from him in style, temperament, and subject. An adventurous young German who had gone to seek his fortune in the U.S.A., he fell in love with a French Canadian girl in New York, followed her to Canada, and became the jovial interpreter of French Canadian pioneer life. His most characteristic works show us the *habitants* bringing supplies to their frontier homes, stopping their sleighs to gossip with each other along frozen roads, or merrymaking at their parties. In style, these attractive pictures are reminiscent of 17th cent. Dutch traditions.

Though active at the middle of the 19th cent., both Kane and Krieghoff are essentially

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

colonial. The Canada of their day was still a frontier country and the style in which they represented it was imported, more or less naively, from Europe. During the century which followed, successive European movements continued to influence painting in Canada as in other parts of the New World, but there was increasing effort on the part of artists to synchronize these influences with their own emerging sense of Canadian cultural and political identity. There was also increasing consciousness of the picture as an aesthetic creation.

Of the generation following Kane and Krieghoff, the two artists who probably deserve first attention are Homer Watson (1855-1936) and Horatio Walker (1858-1938). In their best work, both bring to Canadian painting a new power of simplification and emphasis; a new concern with pictorial construction. Watson applied these gifts to the study of sylvan landscape in Ontario, Walker to the elemental existence of the rural toiler on the Isle of Orleans, near Quebec. The landscapes of Franklin Brownell (1857—) rank highly in the judgment of Canadian collectors. William Brymner (1855-1925), for many years director of the Art School of the Montreal Art Association, is venerated for his constructive influence on his students, many of whom became leading artists of the succeeding generation.

Impressionism injected its powerful influence into Canadian painting through the work of Maurice Cullen (1866-1934) and M.-A. de F. Suzor-Coté (1869-1937), both of whom recognized a natural affinity between the Impressionistic technique and the varied lights and colors of Canadian snowscape. Ernest Lawson (1873-1939), perhaps the most brilliant of all North American Impressionists, was born in Canada and spent his boyhood there, but carried on most of his creative activity in the U.S.A. and is usually classed as an American artist.

Nationalism and internationalism interplay so precariously in the modern world that no nation has yet found a permanent balance between them. As a result contemporary art, in Canada as elsewhere, alternates between national and international tendencies. Typical of the latter in recent Canadian painting is the work of James Wilson Morrice (1865-1924). Morrice found so little encouragement for his Impressionistic and Post-Impressionistic art in Canada that he spent much of his life abroad. French, North African, and West Indian scenes occur more frequently in his pictures than do Canadian subjects. His work was respected in France and is now regarded by Canadian critics as among the most sensitive and original painting yet produced by one of Canadian birth. Another Canadian artist to work and win recognition abroad, first in France and later in the U.S.A., is the contemporary painter, Lillian Freiman. Her studies of humanity combine striking psychological insight with rare powers of graphic expressino.

Conscious nationalism in Canadian painting crystalized in the work of Tom Thomson and the **Group of Seven** during the years which preceded and followed World War I. A number of young artists developed a common enthusiasm for the wilder aspects of Canadian scenery, sensing in rugged northern landscapes a theme for distinctively Canadian art.

Tom Thomson (1877-1917), one of the major artists of the group, lost his life by drowning in a northern lake while the movement was still young. In 1919, his leading survivors organized themselves into the **Group of Seven** for the purpose of exhibiting and crusading together in the interests of progressive Canadian art. The artists belonging to this group were A. Y. Jackson (1882—), Lawren Harris (1885—), Arthur Lismer (1885—), J. E. H. MacDonald (1873-1932), F. H. Varley (1881—), Franklin Carmichael (1890—), and F. H. Johnston (1888—). Johnston subsequently withdrew, but the group was later joined by A. J. Casson (1898—), Edwin Holgate (1892—) and Le Moine FitzGerald (1890—).

Beginning in Ontario and Quebec, the leaders of this movement eventually covered every aspect of the Canadian wilds from the Atlantic to the Pacific and as far north as the arctic wastes of Ellesmere Island within a few hundred miles of the North Pole. Searching for a style appropriate to their subjects, some of these artists at one time emphasized surface pattern at the expense of depth, but their best work rises above this limitation to achieve dynamic and genuinely Canadian landscape painting. The Group of Seven continued its identity until 1933, when it changed its name to the **Canadian Group of Painters** and expanded its membership to include a score of the progressive younger artists of Canada.

Related to the Group of Seven in spirit and period are Clarence Gagnon (1880-1941), painter of Laurentian village scenes, and Emily Carr (1871—), interpreter of West

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

Coast forests and Indian villages. Of the same generation, but aloof from the Group as from all other movements, is David Milne (1884—), an artist with truly individual vision. His unique experiments reveal new and unsuspected possibilities in old mediums and are a delight to the cultivated observer.

So powerful was the influence of the Group of Seven that it dominated many of the younger painters of the succeeding decades. It is difficult as yet to say which of its many followers will make distinctive contributions of their own. The younger contemporaries who remained apart from the Group influence, or who early assimilated it with other influences, appear at present to be making the more important contributions.

Creative leaders in Montreal include Louis Muhlstock (1904—), one of Canada's outstanding draughtsmen as well as a prolific painter; Fritz Brandtner (1896—), a vigorous offshoot of German Expressionism; and Goodridge Roberts (1904—) whose monumental landscapes are subdued dramas of visual mood. Of the French Canadian painters in Montreal, two at least must receive special mention. They are Alfred Pellan (1906—) known in Paris and New York as well as at home for his exhuberent modernism, and Paul-Emils Borduas (1905—). Montreal is also distinguished by an unusual number of notable women painters. These comprise Mabel Lockerby (1887—), Ethel Seath (1879—), Anne Savage (1897—), Sarah Robertson (1891—), Prudence Heward (1896—), Lillias T. Newton (1896—) and Marian Scott (1906—). Mrs. Scott's mural in the Medical School of McGill University involves pioneer work in the artistic embodiment of scientific knowledge.

Among the contemporary artists living in Toronto may be mentioned Carl Schaefer (1903—), water color painter of rural Ontario; the sensitive pictorial composer, Paraskeva Clark (1899—); Thoreau MacDonald (1901—), typographer, graphic artist, and intimate interpreter of wild life; and Bertram Brooker (1888—), whose varied work includes interpretative illustrations, for the most part unpublished, of several literary classics. Henri Masson (1907—) of Ottawa, and Jack Humphrey (1901—) of St. John, N. B., both deal with varied themes but are particularly well known for their studies of the older sections of their respective cities.

Most of the painters listed above are of the experimental or progressive type. Others in considerable numbers, both progressive and conservative, are now active in Canada. They cannot be mentioned individually in the present summary, but their names are to be found in the membership roles of the leading Canadian artists' societies: the Royal Canadian Academy of Art, the Canadian Group of Painters, the Ontario Society of Artists, the Canadian Society of Graphic Art, the Canadian Society of Painter-Etchers and Engravers, and the Canadian Society of Painters in Water Color.

Sculpture, so active an art during the French colonial era, was slow to find a place in the subsequent development of Canadian culture. During the century which followed the English conquest, Quebec clung to its sculptural traditions but their force was slowly diminishing and nothing had appeared in other parts of Canada to replace them except the short-lived activity of the West Coast Indians. Then, during the latter part of the 19th cent., two French Canadian sculptors emerged to provide a link between the original French traditions and the growth of a modern interest in plastic art. They were Philippe Hebert (1850-1917), who provided sculpture for many public buildings, and the painter Suzor-Coté, who modeled small *habitant* groups for casting in bronze.

The 20th cent. has seen a growth both in the number of Canadian sculptors and in their power of plastic conception. Walter Allward (1876—) has created impressive monuments, approaching sublimity in the vast Vimy Ridge Memorial in France. The work of Emanuel Hahn (1881—) reveals a solid mastery of plastic essentials, and that of his wife and former pupil, Elizabeth Wyn Wood (1903—), embodies some of the most original feeling for sculptural form yet found in Canada. The joint studio of Frances Loring (1887—) and Florence Wyle (1881—) is highly regarded, and there is creative promise in the work of several younger sculptors. A Sculptors' Society of Canada was founded in 1932.

As this summary is written (1944), twentieth century trends from many parts of the world are interplaying with Canada's native talents and traditions. Real artistic energies undoubtedly stand ready to serve Canadian life, but in this country as in most other parts of the world, recent political and social conditions have allowed them only grudging encouragement. What the future holds for them will depend to a considerable extent upon the social and economic developments of the post-war world.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

Promising trends are discernable in several directions. The National Gallery of Canada, an institution supported by the federal government, encourages the development of native talent by purchasing and exhibiting native work, and by sponsoring travelling exhibitions, lectures, and other activities throughout the country. The Art Gallery of Toronto, the Art Association of Montreal, and a slowly growing list of other art museums, are also making valuable contributions. The dying or sadly commercialized folk arts are being restored to a healthier condition as a result of direction given by certain provincial governments, notably those of Quebec and Nova Scotia. The almost extinct Indian art is being assisted by the Society for the Furtherance of British Columbian Indian Arts and Crafts. A renewal of fine professional craftsmanship can be seen in various quarters, as for instance in the work of a number of contemporary Canadian potters. Canadian painters are being used to create official war records during World War II, as they were during World War I. Taken as a whole, the aspirations of Canadian cultural leaders are toward the increasing use of art in ways that will enrich, and be enriched by, the hoped-for "century of the common man."

**cancella.** See EARLY CHRISTIAN ARCHITECTURE.

**cancrizans.** See canon.

**candae.** See tiara, papal.

**candelilla wax.** See wax.

**candi** (Malay). Word of temple, as, Candi Sewu of Java.

**canephoros** (Gr.). A basket-bearer, basket usually being carried on the head and containing religious objects.

**canon.** A polyphonic composition in which one of its constituent melodic lines is repeated by imitation in its entirety by at least one of the other melodic lines. One or more parts presenting free counterpoints to the canon may be added.

**double canon.** Canonic imitation applied to a pair of simultaneously presented melodic lines.

**canon by inversion.** Canonic imitation using the inversion of the original melodic line.

**crab canon** (also **cancrizans,** from L. **cancer,** crab; **canon by retrogression**). A composition in which the counterpoint accompanying a melodic line is that same melodic line read backwards from its last to its first tone.

**mirror canon.** A canon which from a given point repeats itself backwards. The term is used figuratively, because the second half of a mirror canon may be thought of as being a reflection of the first half in a mirror placed vertically at the turning point. The term is sometimes applied also to a canon by inversion, interpreting the imitating part as a reflection of the original part in a mirror placed horizontally between the two parts. This usage, however, is misleading and should be avoided.

**riddle canon.** A canon in which the place of the entrance of the imitating part—or parts—is not indicated by the composer and has to be plotted by the performer. In elaborate cases of riddle canon the imitating part may enter at several different places and intervals.

**endless canon.** A canon leading into its own beginning so that it may be repeated without break. —E.K.

**canonical hours.** See hours, canonical.

**canon, sculptural.** Although canons of anatomical proportions are implicit in earlier Greek statues, notably the "Apollo" figures of the sixth century B.C., Polyclitus of Argos (fl. 450-420 B.C.) was the first to make an exact study of the proportions of the human body and formulate, what he considered to be ideal relationships, in a treatise called "The Canon". Vitruvius attempted to reconstruct these ratios as follows: the palm

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

is the unit, the foot is three palms, lower leg six, thigh six, navel to ear six; the foot is one-sixth the total height, the face one-tenth, the head one-seventh. This was approved by Galen as medically sound. It is apparent, however, from a study of the extant copies of Polyclitus' statues, that Vitruvius' analysis was too mechanical, and that the formula was more dynamic, based on geometric rather than arithmetical proportions; but the statues indicate that Polyclitus favored a stalwart, muscular type. In the following century Lysippus of Sicyon modified this canon, substituting for the squarely-built figures of Polyclitus a more rangy type, with slimmer body, longer legs, and smaller head. —W.R.A.

**canopy.** A projection or covering over windows, doors, niches, etc.

**canso.** See MEDIEVAL MUSIC.

**cantata.** (1) Originally, something sung, in contrast to something played (sonata). (2) Later, a composition for solo and chorus; a short oratorio (q.v.).

**canticle, canticum.** *Mus.* Church-service psalm or hymn.

**cantiga.** See MEDIEVAL MUSIC.

**cantilena.** A melody, air.

**cantilever.** A beam or other structural member projecting from a wall or column and supported only at one end.

**cantillation.** A chanting or half-singing recitation of biblical and liturgical texts practised by Hebrews and Christians. See JEWISH MUSIC.

**canting.** See ex libris.

**canting arms.** See HERALDRY.

**canto formo.** See cantus firmus.

**canton.** See HERALDRY.

**Canton crepe.** A fabric heavier than crepe de chine; may combine silk and rayon yarns.

**cantor.** See JEWISH MUSIC.

**cants dels Romeus.** See MEDIEVAL MUSIC.

**cantus firmus.** (1) A plain song (see Ambrosian and Gregorian chant). (2) A theme chosen for counterpoint which remains the same, i.e., "firm," while the other voices or parts always change. See MEDIEVAL MUSIC.

**cantus planus.** See MEDIEVAL MUSIC.

**canvas.** The common support for painting since the 16th cent., this fabric has been used in this way since ancient times. The word, canvas, is now applied to any sort of fabric support that is made up primarily for use with oil paint. Linen with a thin ground was painted in tempera as early as the 12th dynasty in Egypt and probably much earlier. The practice continued steadily during classical times and through the Renaissance. Change to oil painting and to large-scale work has widened the use of it. For the most part, artists' canvas has been made up of a linen with plain cloth weave, though twill has been seen frequently in works from the 16th cent. on. Students' canvases are often made of cotton and a very recent development has been a prepared canvas of glass cloth. As made ready for the market, artists' canvas is prepared with a ground of complicated construction, the upper coatings including oil with white or colored pigments and inert materials. —G.L.S.

**canvas board.** See academy board.

**Canyon de Chelly** (probably a Spanish and English corruption of the Navaho *Tsegi,* "down among the rocks"). A canyon in northeastern Arizona, with two tributaries, Canyon del Muerto (Sp. Canyon of Death, because of a massacre of Navaho in 1805) and Monument Canyon, which contain many cliff dwellings of the Anasazi. Important are White House (1066 to 1229 A.D. by tree ring dating), with about 50 rooms; Antelope House (of early Navaho time), so named because of pictographs of antelope on the cliff walls; and Mummy Cave (348-1284 A.D., tree ring dating), with about 65 rooms. The two latter are in Canyon del Muerto. The site, which has been occupied by the Navaho for probably several hundred years and figures prominently in Navaho mythology, is now the Canyon de Chelly National Monument. —H.G.

**canzone.** (1) A folk song. (2) A part song. (3) An instrumental composition in two or three parts, with passages in imitation; somewhat like a madrigal. —F.M.G.

**capital.** The top member of a column, effecting the transition from the circular column to the horizontal architrave course. In **Egypt**

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

the chief decorative shapes used were the conventionalized lotus flower or bud-cluster and the papyrus flower or bud-cluster. On **Persian** capitals a picturesque but structurally weak design of the fore parts of two bulls placed back to back above volutes was used. **Minoan** capitals had a cushion shape under a narrow crowning block. The **Greeks** evolved the three capitals which have since been used most widely in western architecture: the Doric, Ionic, and Corinthian. The **Doric** consists of a square crowning block (abacus), and a cushion (echinus), in its early form puffy, but by the 5th cent. B.C. subtly curving down into the necking that joins it to the column proper; in **Roman** times the echinus contour was reduced to an unimaginative diagonal. The **Ionic** capital consists of an abacus, a double scholl (volute), and an echinus elaborately decorated with ornamentation (bead-and-reel, egg-and-dart, guilloche); the gracefully swinging volutes make it highly ornamental, but it lacks the structural power of the Doric. The **Corinthian** is still more elaborate and less organic in character, consisting of a bell-shaped core from which long volutes arise to support the corners and shortened ones merge into a profusion of acanthus leaves in two florid rows, producing a sumptuous effect which was greatly enjoyed by Roman architects. **Byzantine** architects used a form derived from the Corinthian, but flattened it and made it a more compact type of surface decoration; in addition to the acanthus they represented basket weaving, melon ridges, and interlacing circle between the abacus and the arch above. Sometimes they added an impost block, similar to the capital in shape. **Romanesque** capitals are also Corinthian in shape, but show a great variety of flatly carved decorative motifs: birds, animals, human figures, and robust foliate designs. In contrast, **Gothic** capitals are more deeply cut, with fantastic foliage, animals, and figures, emerging in picturesque decoration which calls attention to itself rather than contributes to the structural function of the capital. —W.R.A.

**Capo di Monte ware.** See CERAMICS II.

**cap of maintenance.** See HERALDRY.

**capriccio.** A whimsical musical work of irregular form.

**Capsian art.** See PREHISTORIC ART.

**caput mortuum.** See Indian red.

**caquetoire, caqueteuse.** High-backed lightweight chair with curved arms, originating in 16th cent. France.

**caravanserai** (Ar.). An open or vaulted court with one or two stories of small rooms surrounding it. See ISLAMIC ART.

**carbonated glass.** See GLASS AND GLASSMAKING.

**carbon ink.** See ink.

**carcer** (L.). Prison; starting stall in a Roman circus. See circus.

**caricature.** A drawing or description of a person in which the artist selects and emphasizes unusual characteristics to the point of grotesqueness with the intent of ridicule or burlesque. A process of characterization which over-emphasizes the individuality of a person.

This form of satire can be found in the frescos of the Romans at Pompeii and Herculaneum. In the Middle Ages caricature was manifest in the gargoyles, the characters of Reynard the Fox, the Devil and Death. In the 16th cent. Hans Holbein in his designs of the Danse Macabre drew a set of satirical moralities which caricatured the mysticism of the medieval period. Caricature as an art form was born with the Renaissance in the Netherlands with a multiplicity of prints by such men as Jerome Bosch and Pieter Breughel which were satirically intended. Jacques Callot, Hogarth and Goya drew telling caricatures. In the 18th and 19th cents. caricature developed in the works of Swift, Fielding, Rowlandson, Daumier and the English magazine *Punch*. In the United States Thomas Nast in *Harpers Weekly* created a vogue for caricature. The American school was strongly national as is shown in the works of A. B. Frost. This vogue for caricature has continued to the present time in the newspaper cartoons and the cinema cartoon comics. —R.L.W.

**carillon.** A set of bells struck by hammers.

**carmen.** *Mus.* In early songs, the upper voice-part, above tenor.

**carmine lake.** See cochineal.

**carnation.** Flesh tints in a painting. *Rare.*

**carnauba wax.** This is a hard wax derived from the Brazilian palm where it occurs as a deposit on the leaves. It is yellowish in

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

color and is distinguished by its hardness and high melting point. It is a frequent component in wax mixtures where a high gloss is wanted. —G.L.S.

**carol.** Festal songs used esp. at Christmas and Easter.

**Carolingian architecture.** Within the nucleus of the Carolingian Empire (Northeastern France, Belgium, Rhineland, Switzerland) and in Rome, Carolingian architecture supersedes an early medieval "orientalizing" architecture from 770 on. Based on the political philosophy of Charlemagne, Constantinian Roman Christian building types are revived St. Denis, 775; Fulda, 790-819; Rome, S. Prassede, 817-824 and S. Marco, 827-844). Fused with surviving early mediaeval patterns they lead to new types: basilicas with "west-works," crossing towers and deep choirs (Centula, St. Riquier, 790 and Corvey, 822-875), or central buildings surrounded by aisles and galleries (Aix-la-Chapelle, 795), characterized by rich exterior group formations, monumental size, blank exterior, and lavishly painted and stuccoed interior. See GERMAN ART; also Gall, *Karolingische und Ottonische Kirchen,* 1930; Krautheimer, The Carolingian Revival of Early Christian Architecture, *The Art Bulletin,* 1942; Lehmann, *Der frühe deutsche Kirchenbau,* 1938. —R.K.

**Carolingian art.** The Carolingian epoch in art is named for Charlemagne and his successors. It began about 800 and ended around the middle of the 10th cent., overlapping the Ottonian epoch. Its importance lies in the fact that during that time the late antique forms were transplanted into the north and were merged with the native northern tradition of art. In this way the Carolingian epoch became the basis for the entire post-antique development of European art.

In architecture the stone building was taken from the south together with certain ground plans, two of which were of foremost importance, the centralized and oblong plans. The most important building of the centralized plan is still standing, the palace-chapel of Charlemagne (805), at present a part of the Cathedral at Aix-la-Chapelle. Another Carolingian building still standing is the church of St. Michael at Fulda (820). The second ground plan, the oblong plan of the basilica, was changed in the North in a very characteristic way. The Carolingian buildings of this type which are still preserved are St. Peter in Mustail, Graubuenten (Tyrol), the Einhard basilica in Steinbach (Odenwals), and some parts of the present churches of Niederzell and Oberzell in Reichnau. Other Carolingian buildings of the oblong type are the West Gothic Royal Hall, now Santa Maria de Naranco (848), and some parts of the church in the Cloister of Corvay on the Weser. See also the preserved ground plan of the Carolingian basilica, which is a part of the entire ground plan of the Cloister of St. Gallen, built in the year 820. One very important example of Carolingian architecture is the entrance hall of the now destroyed cloister in Lorsch (774).

We know from documents that there were important murals from this epoch, but none of them are preserved. But there are a great number of illustrated manuscripts still in existence. One famous school of miniature painting was the **school of Godescalc,** so named after the writer Godescalc who, between 781 and 783, wrote an Evangeliar (now in Paris) for Charlemagne and his wife Hildegard. Another was the **school of the Ada Group,** named after the Abbess Ada of Mainz who, in about 800, ordered an Evangeliar (now in the city library in Trier). This latter school was localized in the country of the Lower Rhine. Among others of note were the **Palace school of Charlemagne** in which the famous Reichs-Evangeliar was written, the **school of Reims** where the Ebo Evangeliar and the Utrecht Psalter were written, the **school of Metz** (Drago Sacramentar, related to the school of Reims), the **school of Corbie** (Codex Aureus by the two brothers Beringar and Liuthard, written at the order of Charles the Bald in 879), the **school of Tours** (Evangeliar of Charles the Bald under the Abbot Vivian, 844-858), and the **school of St. Gallen** (Psalterium Aureum of St. Gallen).

In sculpture the ivory carvings of this period have become very famous. The different schools of sculpture and their various peculiarities parallel somewhat the different schools of miniature painting. Especially important and well known is the **Liuthard Group,** related in style to the school of Reims.

Starting about 900 virtuosity and baroque tendencies became predominate in painting and sculpture, characterizing the late Carolingian style which overlapped the Ottonian epoch in the last quarter of the 10th cent., and which was signalized by a great confusion of style.

Examples of Carolingian applied art, in so far as they are not identified with miniature painting and ivory carving, are the precious reliquaries like the Bursa of St. Stephen, the Reliquary of Enger, or the chalice of the last Duke of Bavaria, Tassilo. **Carolingian Renaissance.** See GERMAN ART.

**carp.** See SYMBOLISM IN FAR EASTERN ART.

**carpet** (Lat., *carpere,* to pluck; this may refer to plucking wool from the sheep in order to make the carpet or it may have reference to the fabric as something which could be plucked, as the tufts or wool which form its surface.). A carpet is a textile floor covering, with heavy woven foundation, fortified with extra threads forming a pile. Tapestries and carpets in the early days were synonymous with the rugs of today. The general meaning for carpet today is a floor covering which is firmly fastened to the floor and covers the entire floorspace of the room. It can be either of a pile or regular construction. Early pile and tapestry weaving bears a definite relation to that of the pile and woven rugs and carpet production of today. The main types of carpets on the market are oriental, European, hand tufted Axminsters, machine made Axminsters, velvet, Wilton, tapestry, Brussels and chenille. Ingrain is rapidly disappearing due to its poor weaving quality and inferior appearance. —B.E.J.

**carpet structures.** (1) *Eastern or hand tufted type*: woven in the highwarp loom, and now made in Donegal, some parts of England and Scotland, and on the Continent, as well as in Persia, Turkey, India, China, Japan, etc. (2) *Felt carpeting*: may be eastern and hand-made; western and machine-made; or woven felts, in which the operations of the loom determine the decorative features and the structure of the carpet, and felting or fulling produces compactness and strength of carpet surface. (3) *Compound plain woven structures*: may be Kidderminster, Scotch, and ingrain productions; or unions, comprising several types of manufacture, all of which are, however, made in a lower quality of warp, e.g. cotton or jute, than weft yarn, the latter consisting of wool, wool substitutes, and other animal fibres, and also of jute. (4) *Pile carpets*: may be loop pile, e.g. Brussels and tapestry; cut or velvet pile, e.g. Wilton and Axminster, with the pile of the carpet formed in weaving by the insertion of wires into the sheddings of the pile-yarn warp; "chenille" Axminster in which the pile is developed by using a "chenille" or "fur" yarn, i.e., a specially woven yarn composed of warp and weft threads, with the latter classified in the order of the coloring of the design in the carpet, and with the shots of weft in each chenille strand cut to give the pile effect (chenille rugs are producible with the pile characteristic on one or both sides, the latter being classed as double-pile or "reversibles."); royal or machine-wefted Axminster in which the pile is the result of inserting the pile yarns in lengths into prescribed warp sheds in the weaving of the carpet, such yarn being arranged on spools in the order of the color units in the transverse lines of the figuring (Each spool, with its full complement of pile yarn, is equivalent to the formation of a particular row of pile effect in the design. The yarns delivered through tubes or guides from the spools, after being inserted into the carpet ground work, are automatically cut to give an even length of nap.); or compound types of rugs in which the pile is "cut" and "loop" in the center and back respectively; or formed of ordinary yarn, mohair or lustrous worsted in one section of the rug, and in curled, crimped or frisé yarns in the border section. (5) *Inferior varieties of carpeting*: are of jute manufactures and union manufactures. —B.E.J.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

**Carrara marble.** A marble quarried in Luna, Italy, popular since the time of Caesar for sculpture, since it has been readily available at cheap cost. Due to its texture of very small crystals, it lacks luminous quality, and its dull white color is not suitable for expressing delicate modulations or sensuous values. —W.R.A.

**cartoccio.** See scrollwork.

**cartoon** (F. *carton,* from It. *cartone,* pasteboard, from *carta,* paper; L. *charta*). (1) A full scale drawing on paper to be used as a model for easel paintings, mural paintings, mosaics, stained glass, tapestries, etc. The cartoon may be copied, or may be transferred to canvas or plaster by tracing or pouncing, and transferred to tapestry by cutting out figures and details and placing them behind the wool. The cartoon is usually carefully executed in line and value and, when employed, represents the major share of both invention and labor in the execution of a fresco or an oil painting. The practice of preparing accurate cartoons in chiaroscuro was general in the Renaissance, e.g. Mantegna's nine cartoons for the *Triumph of Caesar,* Raphael's cartoons for the Vatican tapestries, and the cartoons of Leonardo and Michelangelo for the *Palazzo Vecchio* frescoes. (2) The term 'cartoon' is also used to designate drawings for reproduction in newspapers and magazines, usually humorous as in the case of political satires or caricatures, or comic strips. Among journalistic sketches of this sort the caricature is the highest type; while with increasing frequency in America the term 'cartoon' connotes ideographic sketches of the comic strip type as contrasted with interpretive and individualized caricatures. See design.—L.D.L.

**cartouche.** An irregular, fantastic, scroll-like ornament, on which armorial symbols or bearings are frequently carved; used in baroque architecture.

**caryatid.** A draped female figure serving as an architectural column, so called after the dancing women of the town of Caryae. The earliest examples in Greece are found at Delphi, where two figures in gay Ionic costumes support the entablature of the porch of the Cnidian Treasury (about 550 B.C.). Similar ones were used in the Siphnian Treasury at Delphi a quarter of a century later. The most famous Caryatids are the six on the south porch of the Erechtheum at Athens; these stalwart figures, subtly varied in pose and in the folds of drapery, which fall to their feet (suggesting the fluting of a column), with thick masses of hair behind the neck to strengthen that weaker element, seem to bear the weight of the entablature with serene dignity. Three caryatids, set back to back, served to support the tripod on top of an acanthus column at Delphi. The device was used infrequently in later times; but in general it has been agreed that the use of the female figure for such a purpose is structurally unfortunate. —W.R.A.

**casa** (Sp.). House, dwelling, edifice, or other structure.

**case.** (1) *Cer.* Plaster mold made from block for making working molds. See CERAMICS I. (2) *Book.* The cover of a book apart from the book itself.

**cased.** *Arch.* Covered with other materials, generally of a better quality. See edition binding.

**casein.** Used largely as an adhesive for joining the wood of painters' panels or for similar purposes in building supports, casein has also served to a limited extent as a painting medium. It is prepared by heating skimmed milk with the addition of hydrochloric acid. This throws the curd of the milk out of suspension and, when dry, that forms a white powder. It can be dissolved in water if an alkali is added but, after the film of the adhesive has set, it is no longer water-soluble. —G.L.S.

**case-work** or **casing.** *Book.* Inserting a book sewn, stitched, or pasted, into its case.

**casing in.** See edition binding.

**cassapanca** (It.). A chest converted into a settee by adding arms and a back. See FURNITURE.

**cassone** (It.). A large chest.

**castanets.** See MUSICAL INSTRUMENTS.

**casting.** Process of forming ware with slip in molds. See CERAMICS I; also METALWORK.

**castle** (OE. *castel,* fm. OF., fm. L. *castellum,* fortress, dim. of *castrum,* fortified place; mod. F., *château* or *château-fort*; It. & Sp. *castello;* G., *Schloss, Burg* or *Festung*). A

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

large building or set of buildings fortified for defense, a fortress, citadel or stronghold, especially of a prince or nobleman; retained as a name for large mansions which formerly would have been feudal castles, especially if built on or near the site of actual castles; similarly in Fr. and G. **chateau** and **Schloss** have been retained to describe private country houses of noble dimension and tenure despite the total absence of fortification. The castle proper, built always to take advantage of naturally defensible terrain, and not infrequently with an eye to offensive strategy as well, consisted at its point of highest development of several distinct but well-articulated parts. At the outermost limits was a high curtain wall, battlemented, often protected by bastions and towers at the corners; in many cases outside this wall was a moat (in German such a castle is distinguished as a *Wasserburg*) crossed only by a strongly fortified drawbridge. Access to the castle was gained through a gate protected by flanking towers or contained within its own miniature fortress, the **barbican.** The gate opened into a ward or base court devoted to soldiers' quarters, stables and other offices connected with the needs of the armed retainers and servants. A second range of walls guarded the inner court where were the great hall, kitchens, chapel, and private apartments of the lord and his family. These were frequently contained within the **keep,** a massive structure at the heart of the castle which was capable of being maintained and defended when all the outer works had been taken by the attacker. In some cases there were as many as three sets of walls, and auxiliary fortifications to protect access to water supply or a river crossing. The arrangement and extent of defensive elements and the relation of domestic to military features varied in particular instances according to a number of factors; but until the castle, hitherto impregnable to nearly every form of attack but treason or starvation, ceased through the rapid development of the cannon in the 15th cent. to be any longer defensible, military considerations were paramount in its design. After this time its two major functions were separated; domestic requirements gradually became the more important and the castle merges into the history of the house in the one direction, or into pure military architecture in the other. The castle first began to acquire its feudal form and significance in the second half of the 10th cent., and received its first important development in Normandy; during the dark ages local chieftains appear to have lived in the patched remains of Roman villas, but as the predatory instinct once again rose to the surface as a dominant factor in European life and fortification became a necessary condition of existence, the lords put palisades around their houses and farm buildings, then for greater security rebuilt the house on top of a mound (Fr. *motte*) surrounded with both a palisade and a moat. By the 11th cent., these crude timber castles which were constantly burning down either through carelessness or arson were gradually replaced with stone buildings, walled and moated, but still consisting, so far as domestic arrangements were concerned of little more than a great hall with an open hearth in the center, a type derived from the north countries, though Romanesque structural methods were used to vault the halls and provide support for the massive stone walls. In the period immediately following the Conquest the Normans invented two new types of castle; the citadel which took advantage of natural rock strongholds, as at Ludlow; and the massive high rectangular or square keep, of which the Tower of London and Rochester, Hedingham and Colchester Castles are the outstanding examples. The Crusades now provided unequalled opportunity for the laboratory study of castle-building; the art was revolutionized through the practical experience thus acquired by the Crusaders and through the lessons they learned from the advanced skill of Byzantine, Mohammedan and Saracen engineers and military architects. Such superb examples as Krak des Chevaliers, Margab and Kalat Sahyum in the Near East, Châteaux Gaillard, Loches and Chinon in France, Alnwick and Berkeley Castles in England bear eloquent testimony to the principles learned in this hard school: there must be concentric lines of defenses, equally strong, one within the other; walls must be protected by flanking towers, and round surfaces should be used where battering rams and scaling machines could be brought up against them; and that each part must be planned in relation to the mutual defense of all the parts. During the Gothic period fewer discoveries of defensive utility were made but there is a constant refinement of the domestic portions of the castle; the great strength of the outer works made possible generous window openings in the residential apartments at the protected core; the invention of the chimney and the hooded fireplace and the development

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

of adequate sanitary systems (which did not carry over into the Renaissance) greatly increased personal comfort; and the taste for luxury which Crusaders and noble pilgrims acquired in Byzantium and Mohammedan lands bore rich fruit in the interior decoration of the castle. During the 14th and 15th cents., the most interesting phases of castle development are those having to do with these domestic improvements, and this is the case in even such brilliant examples of the military architect's genius as Pierrefonds and the Palais des Papes at Avignon; after the Crusades strictly military considerations and improvements in technique are found principally in those castles whose primary function was military rather than defensive, such as Carnarvon and Conway in Wales, Cocca and Turrégano in Spain. The last castle to be built as such in England was Longford (1578—1581) and this was an anachronism; many of the superficial features had lingered into early Renaissance country houses, but the castle as house was doomed as soon as the use of the cannon was mastered. The castles of the late 18th and 19th cents. were of course purely romantic in inspiration, though it cannot be denied that some are extremely effective pieces of rural decoration, and at least one reconstruction of this period, Windsor, is infinitely more convincing to the modern eye as a feudal masterpiece than would have been the building which Wyattville was commanded to transform. —T.A.H.

**cast stone.** Cast concrete resembling stone.

**catacombs.** Any subterranean cemetery provided that it be of sufficient size to house more than the bodies of one family or clan and that its sepulcral chambers be interconnected. Dispersion of this type of burial over the regions adjoining the Mediterranean seems due to the adherence by exiled Jewish communities to the accustomed Palestinian methods of burying the dead. The Christians, who were at first no more than a Jewish sect, were naturally disposed to follow such prototypes and thus were lead to establish catacombs for many of their communities in Egypt, North Africa and Italy. By far the most extended as well as historically the most important of these were the catacombs of Rome. They alone had a history beyond early Christian times; they became centers of the cult of martyrs and in the 8th and 9th cents. the main source of supply for relics required for the establishment of altars in a rapidly expanding Christianity. After having fallen into neglect during the Middle Ages the Roman catacombs were rediscovered in 1578. See EARLY CRISTIAN ART. —R.B.

**catch.** Originally, simply a round for three or more voices (unaccompanied) written out in length as one continuous melody. The catch was for each succeeding player to take up his part in time; this is evident not only from the manner in which it was written but also from the simple and innocent character of the words. But in course of time a new element was introduced into catches; words selected were so constructed that it was possible by mispronunciation or interweaving of words and phrases to produce the most hilarious and comical phrases. The singing of catches became an art, and was accompanied by gestures; the skill with which they were sung has become a tradition. —F.M.G.

**catharsis.** The term occurs in Aristotle's famous definition of tragedy: "A tragedy, then, is the imitation of an action . . . with incidents arousing pity and fear, wherewith to accomplish its catharsis of such emotions." (1449 b28 translation Bywater). An elaboration of this statement by Aristotle is lacking. But there are a few passages in other Aristotelian writings that may be helpful in clarifying the obscure sentence. Cf. *Problems* 864a34; *Politics* VIII, 7; *Rhetorics* II, 5, 8; *Nic. Ethics* 128b11, 15; 136a8; 115a9; 107-a33; etc.

There is not a term in the catharsis clause that has not been the object of millenia of controversy.

(i) *eleos kai phobos,* pity and fear. *Eleos* has little to do with the melting, sympathetic Christian pity (misericordia) that the 18th cent., particularly Mendelssohn, saw in it; but seems to be closer to a strong gush of compassion. *Phobos* means really fear and not terror, as Lessing insisted against Dacier and Curtius. It is "a pain or disturbance arising from a mental presentation of impending evil, destructive or painful." (1382a24). Tragedy is to arouse both compassion and fear.—Corneille preferred to read: either pity or fear; and he added admiration as a third tragical emotion.—Mendelssohn reduced tragic terror to pity, pity being defined by him as a mixed sensation that is composed of love to an object and the displeasure (Unlust) caused by this object's bad luck. Terror is nothing but a pity that surprises us. Confusing fear *for* somebody and fear *with* some-

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

body, he believed that tragic fear, too, springs from pity. Hence, he concluded that phobos has no place side by side with pity in the definition of tragedy. Following Corneille he suggested that it should be replaced by admiration.—Lessing held that the stimulation of pity alone is tragedy's function. However, led on by Aristotle's, "All things that we fear in our own case, the same arouse pity when they happen to others", he seemed to be inclined to explain tragic pity as reflective result of fear for ourselves. He objected to admiration as a tragic effect: it is too cold and moral a feeling. He tried in vain to reconcile Mendelssohn's and his own psychological concept of pity and fear, that reduced the one to the other and vice versa, with Aristotle's definition of tragedy, by claiming catharsis of fear to be of equal importance with catharsis of pity.—The simplest explanation, remaining close to observable phenomena, seems to be that, as a tragedy is the imitation of an action and as every 'now" of an action is in between something that has happened and something that is going to happen, pity is the emotion evoked by what has happened, fear by what is going to happen "From mine eye too a swelling tear did start. No greater may the present evil grow!" (Euripides, *Medea,* transl. W. C. Lawton). A good tragedy fills the spectator with both pity and fear at the same moment. Neither can exist without the other, just as no action,—although it has a beginning and an end, (1450b26)—is without a past and a future. Quite naturally, fear will prevail during the first part and pity at the end.

(ii) " . . . *Its* catharsis . . . " "its" because, according to *Pol.* 8. 7, there are various other things that have a cathartic effect proper to their own nature. Music, for instance, has "its" cathartic effect on religious enthusiasm.

(iii) " . . . *of* such emotions . . . " Some arbitrarily interpret that to mean catharsis *of* the soul *from* such emotions; others, correctly, as catharsis of the emotions themselves.

(iv) " . . . of *such* emotions . . . " *toioutoon* has sometimes been changed into *toutoon,* thus limiting the catharsis to pity and fear. But most modern commentators prefer *toioutoon,* explaining that through the arousing of pity and fear, these *and* similar *pathoi* are purged and purified.

(v) "catharsis". There is a medical, a psychological, and an ethical aspect to the cathartic effect of tragedy; and it seems quite unwarranted to emphasize the one at the expense of the other. This, however, is exactly what has happened. The ethical interpretation, dominant in the 17th and 18th cents. (Corneille, Batteaux, Dacier, Heinsius, Crusius, Nikolai, Mendelssohn, Lessing), has been followed by a psychological (pathological) one in Bernays and Bywater, and a medical one in Margoliuth. It would be quite Aristotelian to describe one and the same process in medical terms as a medical event and in ethical terms as an ethical event.

(a) In medical terms, following Margoliuth, catharsis means the homoeopathic cure in the case of excessive cold in the black bile. Tragedy inspires fear, fear expresses itself in trembling, trembling, in turn, is a sign of cold. Thus homoeopathically, by excessive cold being introduced into the organism from the outside, the excessive internal cold of the black bile is equalized, and a proper balance restored between heat and cold. The cathartic effect of tragedy is this homeopathic restoring of equilibrium between heat and cold in the black bile.

To interpret catharsis in purely medical terms reduces tragedy to the status of a drug. The effect of tragedy, to be sure, has a physical aspect to be explained in medical terms. (It would seem, however, that Margoliuth is deliberately ignoring the definition of catharsis given in 864a34 and is misunderstanding 466a30.) But catharsis has above all an emotional aspect that has to be explained in appropriate terms, though with the aid of the medical analogy implicit in the term catharsis.

(b) The pathological interpretation of catharsis will differ according to whether one chooses as guide *Politics* 1342a or the definition of catharsis as given in *Problems* 864a34. In the first case (*Politics* 1342a), Aristotle would have meant by tragic catharsis the soul's liberation of an excess of fear and pity. Persons inclined to fall into religious frenzy are restored as though they had found healing and purgation, after having been excited by appropriate melodies to mystic frenzy. Similarly, the tragic catharsis would consist in exciting aesthetically pity and fear to a high pitch and thus restoring to the soul a healthful balance of these emotions.

This, however, seems to be more a purging of the soul from these emotions than a purging of the emotions themselves, as demanded by the text of the *Poetics.* The medical definition of catharsis as given in *Problems* 864a34 will be more helpful in this respect.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

To cleanse, medically speaking, is the function of certain substances, so-called drugs, that cannot be absorbed by the body (1) because of their excessive heat or cold; (2) because of their quantity. Dissolved in the stomach, but overpowering the intestinal tract, they rush through the body carrying with them various obstacles. (cf. 864a31). What is cleansed? Directly, the organs through which the drug passes; indirectly, the organs connected with these; and finally, the whole body. The cleansing substance is the drug which, though dissolved in the stomach, proves "overpowering" and therefore unabsorbable in the intestines. The body is cleansed of material obstructing the drug in its rush toward elimination from the body i.e., waste products that the body has been slow in eliminating. The fast-moving drives before it that which is sluggish.—This is the essence of catharsis.

How does this medical description of catharsis resemble the emotional effect of tragedy? The analogy is obvious enough. The fearful and pitiful overwhelm us through their quantity, bringing pity and fear and, through them, the whole soul into rapid motion. Thus they cleanse pity and fear, the emotions connected with them, and indirectly the whole soul of the sluggishness that in everyday life prevent pity and fear from being felt. Considerations of profit, interest, selfishness, etc. that leave us relatively unmoved and cold when witnessing a fearful and pitiful event in real life, are washed away on the waves of pity and fear, aroused by tragedy.

This interpretation, capable of being supplemented on the physiological side (as Margoliuth attempted to do), might well be called phenomenological in the popular sense of the term, since it remains close to the psychological and existential phenomena, observable in an aesthetic situation.

(c) A onesidedly moralistic interpretation of catharsis - - purification instead of purging—sees the effect of tragedy in the "moralische Verbesserung der Leidenschaften" (moral improvement of the passions—Lessing, *Hamburgische Dramaturgie*). Taking his orientation from the theory of the means in the *Nic. Ethics*, Lessing has too much or too little pity and fear disposed of by the tragic effect and the soul become virtuous by now finding itself situated in the middle between the extremes.

(d) A fourth trend of interpretation, metaphysical in scope, issues from German transcendentalism. From the aesthetically extraneous perspective of a deep, but doubtful philosophy of history, catharsis is given an important function in the history of the spirit. According to the scheme of this history, the Greek tragedy is a desperate attempt at overcoming the cosmic loneliness of Greek consciousness; and catharsis replaces the older dionysic unification with the All-One of nature, raising man from the limitations of self-feeling to sympathy with all being in its suffering. (Cf. Fritz Kaufmann, *Die Philosophie des Grafen York von Wartenberg*). From Herder through Schelling and Schopenhauer to Nietzsche, this trend of interpretation indicates more about the standpoint of the interpreter than about Aristotle's own intentions which seem to be limited to an artistic analysis *within* the aesthetic situation.

—W.C.

**cathedra.** See EARLY CHRISTIAN ART.

**cathedral.** A church containing the cathedra, or official chair of a bishop.

**Caucasus rugs.** Inspired by Persia and Turkey. Wrap and weft of wool. Ghiordes knot always used. No predominance of red in designs. Rectilinear panel fringed with latch-hoops and ground filled with detached devices such as octagons, stars and animals. —B.E.J.

**caurī** (Skr.). See fly-whisk.

**causeuse** (Fr.). A type of sofa for two.

**cauterium.** Among the few tools mentioned in the history of ancient painting is the cauterium, a spatula of metal with a rounded end. It was evidently used largely with melted wax and may have been responsible for some of the conformation in that group of mummy paintings known as Fayum portraits. —G.L.S.

**cavatina.** (1) A short song of lyric character. (2) In opera, a vocal air shorter and simpler than an aria, and in one division, i.e., not in ternary form *a-b-a*. —F.M.G.

**cavo-relievo.** Hollow relief (q.v.). See relief sculpture.

**C clef.** See NOTATION.

**ceiling.** The upper side or overhead covering of a room or chamber. See INTERIOR ARCHITECTURE AND DECORATION.

**celadon ware.** A light-green glazed ware. The name is of French derivation originally implying the color of the coat worn by an actor of the 18th cent. who played the part of Celadon. See seiji; lung chùan yao. —J.A.M.

**celesta.** See MUSICAL INSTRUMENTS.

**cella.** Main chamber of classical temple wherein stood the cult statue. See HELLENIC ART.

**cello.** Abbrev. for violoncello, for which see MUSICAL INSTRUMENTS.

**cellophane.** A synthetic material compounded from cellulose as is rayon. It is poured out into flat sheets resulting in a transparent material of the thickness of paper. Cut into narrow strips it can be woven in combination with other fibres into a sheer fabric. —G.W.R.

**celluloid.** Rarely but occasionally used as a film material or varnish, celluloid is associated with the various cellulose products that have come into the paint trades during relatively recent times. It is cellulose nitrate plasticized with camphor. —G.L.S.

**cellulose products.** Chief among these are cellulose nitrate and cellulose acetate. Both are clear film materials, soluble in a number of organic solvents but not affected by water or turpentine. They have been used slightly as mediums for painting, but are generally classed with varnishes or surface film materials. Cellulose nitrate, known also as gun cotton or pyroxylin, has about 100 years of history. It is faintly yellow and has the disadvantage of being highly flammable. It is not stable to light for long periods and is particularly deteriorated by strong sunlight. Cellulose acetate is more stable but requires a large amount of solvent to convert it into a brushable fluid. —G.L.S.

**celt.** Implement in the form of an axe-head. in oriental art, sacrificial and symbolical forms, generally of bronze, stone or jade. —J.A.M.

**Celtic art.** The style of Celtic art as it is manifested in decorative designs and ornaments on swords, spear-heads, fibulae, bracelets, etc., originated probably in the Middle Rhine area under the influence of Mediterranean cultures and reached its climax on the European continent ca. 1st cent. B.C., during the last phase of the **La Tène** culture; hence the style is sometimes referred to as La Tène style. (La Tène is the site where the best known objects of this style were found.) The Celtic ornaments are primarily of a linear geometric design—developed into intricate patterns in the late phases—in which S-curves, spiral S-turns and the so-called trumpet forms occur frequently. The Celts of the West were renowned for their refined and intricate work in enamel, and they frequently employed red coral for the decoration of such bronze objects as fibulae, shields, brooches, etc.

The Celts were Romanized in the West of Europe ca. 25 B.C., and were Germanized or displaced by Teutonic tribes in the regions East of the Rhine at approximately the same time. The Celtic culture, however, remained dominant in England until the invasion of the Anglo-Saxons and in Ireland well into the Middle Ages. In the latter region the so-called La Tène style is sometimes referred to as late Celtic which is not very meaningful in view of the fact that Celtic culture in some places endured almost unchanged until a relatively late date, as noted above.

The 6th cent. saw the beginning of a revival of the Celtic style in Ireland. Some authors ascribe the flourishing of early Christian art in the following centuries in Ireland to this revival, which exhibited an admixture of foreign style elements, e.g. the animal style which is of Teutonic origin. In the 7th and 8th cent. the so-called La Tène (late Celtic) style is displaced by the interlaced style which, however, contains elements of the earlier stylistic phase (e.g. the *Book of Durrow*). See *Trésors Archéologiques de l'Armorique Occidental,* 1886; George Coffey, *Royal Irish Academy Collection,* 1910; *Christian Art in Ancient Ireland,* vol. I, 1932, Adolf Mahr, ed., vol. II, 1941, Joseph Raftery, ed. —H.H.

**cembalo.** A harpsichord (q.v.).

**cement.** In the arts this word is commonly used as a synonym of adhesive and means any kind of film material which will join parts of objects together. It may be referred

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

to, also, as a support for wall painting and in that case Portland cement or concrete is meant. —G.L.S.

**cendal** (L. *sendal*). Called sarcenet since the 15th cent. A thin taffeta used for banners for royal or ecclesiastical processions. —G.W.R.

**censer.** Generally, in oriental art, an incense burner with three legs and two perforated covers.

**centaurs.** These combative and amorous horsemen, who, according to the fertile Greek imagination, inhabited the mountains of Thessaly and Arcadia, were a favorite subject of Greek artists, as early as the 8th cent. B.C., both because of their picturesque exploits and because of their interesting combination of human and equine forms. In early art they were regarded as human beings in front, with the body and hind legs of a horse, but by the 6th cent. they were represented as men only to the waist. Their battles with the Lapiths were the subject of the west pediment at Olympia and many of the Parthenon metopes, and they were pictured often by Greek vase painters. In later painting, Botticelli's Pallas and a Centaur is the best known example. The subject continued to interest sculptors. Medieval imagiers, following the patterns established by the Bestiaries, carved on cathedral doorways and in cloisters squat little centaurs to personify the forces of evil that attack the righteous. Michelangelo, Bologna, Canova, Thorwaldsen, Barye, Begas, Manship and Bourdelle are among the great sculptors who made use of this theme. Bourdelle found it especially fascinating; he left several sketchbooks full of drawings and watercolors of Centaurs, and considered his Dying Centaur his finest sculptural achievement. —W.R.A.

**centering.** A timber substructure supporting an arch in construction which is removed when the keystone is put in place making the arch self-supporting.

**center of picture, of the vanishing line, of view, of vision.** See PERSPECTIVE.

**centipede.** See SYMBOLISM IN FAR EASTERN ART.

**Central American aboriginal art.** See ABORIGINAL AMERICAN ART.

CENTRAL ASIAN ART (TURKESTAN). By the art of Central Asia is meant the architecture, sculpture, and painting that flourished in the Buddhist kingdoms extending along the highways of caravan and pilgrim that stretched from northwestern China to Afghanistan. The routes on which these capitals of religion and commerce were situated skirted the north and south of the great Taklamakan desert. The date of this Sino-Indian art is roughly from the 3rd to the 10th cents. A.D. In it are found those same elements that made up the international population of the silk-roads—Indian, Iranian, Classic, and Chinese. British, French, German, Japanese, and Russian expeditions have all been active in the archeological exploration of these regions since the beginning of the 20th cent. The most notable finds were made by Sir Aurel Stein and a number of German expeditions under Albert von Le Coq.

Since we know that as early as the 2nd cent. A.D. Syrian traders were exploring the commercial possibilities of Turkestan, it is not at all surprising that the 3rd cent. cycle of paintings from Mirān in southeastern Turkestan should reveal the same stylistic extension of Roman provincial forms as the art of Gandhāra in northwestern India. The wall-paintings of the circular cells, excavated by Sir Aurel Stein, consisted of a frieze of *Jātaka* scenes that are to all intents and purposes the pictorial equivalents of the Roman reliefs of Gandhāra. A high dado below this had representations of erotes bearing a garland, in the swags of which were busts of winged divinities, and what have been identified as personifications of the heavenly bodies. This is a familiar device on the sarcophagi of Late Roman and Early Christian art. The heads of the angels and planetary deities are abstract masks recalling the portraits of Palmyra and the Fayum. The lime-plaster sculpture found at Mirān and at the Rawak vihāra near Khotān again reveals techniques of Late Antique origin, such as the reduction of the drapery folds to a system of striated ridges; occasional heads betray something of the same realism and pathos that distinguishes the Greco-Buddhist sculpture from Hadda in Afghanistan.

The 5th, 6th, and 7th cents. A.D. saw the florescence of a number of styles, semi-Indian, semi-Iranian in character. This may be illustrated principally by the wall-paintings decorating the temples of the Thousand Buddha caves at Kyzil (Kuchā) on the northern silk-road. The people of the Kuchā oasis were of

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

the Tocharian race, and are believed to be the descendants of the Scythian tribe of the Yüe-chih who began a westward migration from China in the 2nd cent. B.C. Their language belonged to the Indo-European group, and their costumes, as seen in the wall-paintings, seem almost medieval European in style. A large collection of these wall-paintings is installed in the Museum für Völkerkunde in Berlin. Their subject matter confirms the testimony of the Chinese pilgrims, such as Hsüan Tsang, that the Buddhists of Turkestan were almost all followers of the Small Vehicle (Hinayāna), in which only the person of the founder, Śākyamuni Buddha, and the events in His earthly mission were presented for worship in art.

The earliest of the styles dating from ca. 500 A.D. may best be studied in the decorations of the Peacock Cave at Kyzil. An inscription in the Cave of the Painter gives a date of the early 6th cent. This is essentially a provincial Indian manner of painting. The svelte and languorous forms emanate the same sensuous warmth and grace that we find in the more truly Indian wall-paintings at Bāmiyān in Afghanistan. The heavy, plastic shading, characteristic of Indian painting, is largely absent in this technique, and the color scheme, limited to dark reds and browns and malachite green, lacks the richness and tonal range of the famous Indian murals at Ajantā.

The second Central Asian style, defined by the German scholars as Indo-Iranian, has been dated 600 to 650 A.D. The wall-paintings in the Cave of the Red Dome contain inscribed portraits of three kings of Kuchā who are known to have reigned in the late 6th and early 7th cents. A.D. The best illustrations of this manner are the decorations of the Maya Cave at Kyzil. This phase of Turkestan painting is distinguished by its strident brilliance of coloring: green, orange, and lapis lazuli blue are the dominating hues in this completely non-realistic palette. Strangely inarticulated figures have their faces and bodies outlined with thick bands of orange shadow that confers a certain plasticity on these mannikin-like forms without, in any sense, recording actual effects of illumination. Whereas this technique is presumably Indian in origin, the round placid faces, the types of headdresses and jewels are reflections of the art of Iran in the Sassanian period. An abstract flatness characterizes the treatment of the costumes, in which the pattern of the stuff is represented without consideration for either the foreshortening of the folds or the form of the body beneath. This strange combination of plastic and patternized elements reminds us of the hieratic forms of Byzantine art of the first Golden Age, in which the heads, set on flat bodies, retain something of the solid and realistic qualities of Roman art. What may be either a later development or a contemporary variant of this Indo-Iranian style may be seen in certain figures in which the thickened outlines have been replaced by contour lines of an even thickness and wiry, iron-hard quality. It is worthy of note that paintings in this Central Asian technique are to be found in the Buddhist cave-temples at Tun Huang in westermost China. In some of the *Jātaka* scenes painted at Kyzil the wall is divided into many interlocking chevron-shapes. Each one of these conventionalized mountain peaks frames an isolated figure or episode. This abstraction of what is essentially a landscape background into multiple space-cells may be seen in a further state of development in the earliest Buddhist wall-paintings at Tun Huang. The site of Kyzil has also yielded a large collection of highly polychromatic sculpture, which in style seems to be related to the Greco-Buddhist art of Gandhāra. The perpetuation of this Romanized Indian manner until such a late date is probably to be explained by the use of moulds, numbers of which have been found at this site.

The architecture of the cave-temples at Kyzil is very simple, and is not to be compared with the scale and grandeur of the grotto-temples of India, although probably the idea of hollowing sanctuaries from the rocks goes back to an Indian origin. The most common type of temple is either square or rectangular in form, usually with a small stûpa in the center of the chamber. In a slightly more elaborate type a porch or vestibule precedes the sanctuary, an arrangement that can also be found in the cave-temples at Bāmiyān. Occasionally, the shrine is in the form of a single long narrow chamber with a barrel vault cut out of the rock. The so-called lantern roof is also found in occasional examples at Kyzil.

The sculpture and painting of the famous Buddhist cave-temples at Bāmiyān, dated from the 4th to the 6th cents. A.D., must in a sense be regarded as Central Asian in character. Since all of the styles represented in the paintings at Kyzil may be found at this Afghan site, it seems possible that all these various styles originated at Bāmiyān. The

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

two colossal Buddha statues, 120′ and 175′ in height, are magnifications of images in the Gandhāra style. The paintings in the niche of the larger image are partly in the first, partly in the second Kyzil style. A Bodhisattva in Group E at Bāmiyān, painted almost entirely in lapis lazuli blue, corresponds to the more linear phase of the Indo-Iranian style.

The paintings from the 8th to the 10th cent., recovered from the Turfān oasis in northeastern Turkestan, are almost completely Chinese in style. During these centuries this territory was under the rule of the Uighurs, a strong Turkish tribe, whose civilization was largely Western in character. It is evident from both the types and costumes represented in the paintings of Turfān that this Turkish culture with many elements of Western and Persian origin was greatly influenced by its contacts with the Chinese. The great series of wall-paintings from the monastery of Bezäklik, now divided between the Museum for Central Asian Antiquities in New Delhi and the Museum für Völkerkunde in Berlin, bear inscriptions in Chinese and Brahmi. The principal panels consist of enormous, almost identical compositions representing the Buddha Śākyamuni in various earlier incarnations, greeting the Buddhas of these past eras. The figures themselves show exactly the same synthesis of Indian and Chinese elements that distinguishes the mature art of the T'ang period in China. Both Chinese and Indian types are represented; the draperies of the Buddhas are drawn in a linear version of the Gandhāra formula; the architectural details and the floral patterns of the frames are completely Chinese. The heads of the Buddhas, in their suggestion of the spheroidal mass of the head, in a completely linear technique, conform to Chinese Buddhist painting of the 8th and 9th cents. A.D.

Among the archeological finds in the Turfān region were numerous illuminated manuscripts dedicated to the Manichaean faith, a syncretic religion of Persian origin that had found favor with the Uighur chiefs. The style of these brilliantly colored book-illustrations has many reminiscences of Late Antique and Near Eastern art forms. It probably represents a perpetuation of a Sassanian Persian style of painting kept alive by the Manichaean tradition.

The Buddhist art of Central Asia comes to an end with the eastward advance of Mohammedanism. As early as the 8th cent., the monasteries of Kyzil were devastated by the Islamic ruler of Kashgar, and by the 10th cent. A.D. only the easternmost reaches of Turkestan had escaped the rising tide of Mohammedan conquest. The Uighur civilization in this region was finally overwhelmed by the Mongol invasion of Chinghiz Khan in the 12th cent. **central visual ray.** See PERSPECTIVE.

**centrolinead.** See PERSPECTIVE.

**ceramic sculpture.** See CERAMICS I.

**CERAMICS I: materials, processes, techniques.** The art of ceramics had its beginning almost with the beginning of man. No other art traces the story of mankind on this earth so clearly as ceramics. The tides of time have washed away many races, but evidences of their existence has been left in the fragments of the humble art of the potter.

There are two reasons why this is true. The material, clay, is found in abundance in practically all parts of the world and since it is so plentiful it has no intrinsic value. The more important reason is that although seemingly fragile it has great resistance to atmospheric influences and is considered the least perishable of all things of all ages.

Ceramics or keramics (Gr. *keramikos,* potter's clay, Fr. *ceramique,* G. *keramik*) is a broad term given to all baked or fired clay articles. In Greek mythology *Keramos,* son of Ariadne and Bacchus was the patron god of the potters. The art is so ancient that its origin is unknown., but it is interesting that in every civilization of which we have any record of their religious beliefs, all give credit for its beginning to the Gods. Aside

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

from being a wonderful gift to mankind, many things seemed to happen, especially during firing, such as cracking and warping which primitive man could not understand. It was only natural to place the responsibility for good or bad pottery on the supernatural and as a result many interesting rituals and customs were observed in its making. Ceramics have told us of man's daily life, death and burial, his migrations, trade and conquests. It has been an essential part of his very existence.

As to its discovery, it is rather easy to imagine how, as prehistoric man walked through the rain-soaked mud, he noticed his footprints and how these impressions became hardened by the wind and sun. The earth over which he had built a fire was even harder and had changed in color. Just when he intentionally used these discoveries for making pottery is unknown, but it is generally believed that it may have been invented in many parts of the world. It is not as easy as it sounds and to the experienced potter it is much more than squeezing a piece of clay into shape and firing it. It is a long, tedious process which must have developed very slowly.

*Material.* The basic material in ceramics is clay. Natural clays are found everywhere and are usually fine grained, more or less coherent and become soft and plastic when wet. In early times the quality and character of the ware was largely dependent on local soil. This is no longer true as clays are now shipped from all parts of the world and combined to give the ideal mix (body) for the particular type of ware desired. The advantages as well as the limitations of the various kinds and colors gave inspiration to the potters and distinct styles soon developed. The economic value of clay depends on either the presence or absence of impurities. Some of these are organic humus, fossils of plants, animals and shells, carbonate and sulphide of lime, sand or oxide of iron. For instance, when iron is found in the ferrous state the clay may be blueish, greenish or grey and when in the ferric state is red, brown or yellow. Corinth was noted for its beautiful white clay while Attica was equally famous for its rich red.

There are many types of clays each having particularly desirable features: For instance, **ball clay**, also known as bond, pipe, fat or plastic clays, useful because of its bonding power; brick or tile clay which usually contains sand which prevents too great shrinkage; fire clay which is refractory to heat. There are many good American clays of practically every wanted characteristic.

*Classifications.* Ceramics may be roughly divided into two classifications, pottery and porcelain. Each of these may be again divided into two types, hard and soft. The differences are attributed to a few minor ingredients, preparation and the degree of heat to which they have been subjected. The results are their relative hardness of surface and their power in resisting the action of fire. Other terms may be used such as vitreous or non-vitreous, translucent or opaque.

With possible exception, pure clays exist in theory only. The ingredients in a typical pottery body are silica 60, alumina 30, iron 7, lime 2, as compared to porcelain, silica 66, alumina 30, potash 3½ and a small amount of lime and magnesia. The materials and amounts are similar, but with the proper preparation and firing the results are quite different.

There are many types of clay products other than art wares. A few of them are building materials—brick, wall, insulation and sewer tile, etc.; refractories—furnace and stove linings, grates, etc.; general ware—table, cooking, refrigerator, etc.; sanitary ware—bathtubs, lavatories, fountains, etc.; electric insulators and countless others. There is a best material and procedure of handling each. They may be made of terra-cotta, earthenware, stoneware, yellow ware, white granite or ironstone, semi-porcelain or one of the several types of porcelain. There are other terms such as crockery, pottery and china—many of them misleading. For instance, Webster says under "CHINA—porcelain ware, originally brought from the Far East, loosely crockery." Then under "CROCKERY—earthenware." To most potters these are entirely different types. The word pottery (L. *Potum*, drinking vessel; Fr. *Poterie*) refers to all objects made of clay including porcelain. For the sake of understanding each other we will use the word pottery in reference to **earthenwares** which are first, non-vitreous, porous, absorbent, opaque (unless extremely thin), glazed or unglazed and also to hard earthenwares which are vitreous such as stoneware (G. *Steingut*, Gr. *grés or* Chin. *boccaro*). On the other hand we will use the word porcelain only in reference to translucent, vitreous ware (which means glass-like), having a sharp glassy structure and angular fracture, non-absorbent and impermeable.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

*Porcelain.* The word porcelain was from the Latin and was in use in Europe before the substance as we know it was even known. The Italians used the word *Porcellana* for the cowrie shell. Marco Polo, after his visit to China in 1280 used it to describe the strange substance he had seen there. It was used to describe not only the material of Chinese porcelain, but also other things which in contrast to ordinary pottery had a porcelain quality of being transparent.

Some of the many varieties of porcelain are hard, soft, natural, artificial, chemical, electric, high tension, phosphate and dull. The main ingredient is kaolin, which is made up of silica and alumina, formed by the decomposition of granite rock. It gets its name from the mountain in China, *Kao-Ling* near the pottery center of *Ching-Te-Cheng.* It was first made by the Chinese about 206 B.C. At high temperatures the non-fusible silicate of alumina unites with the fusible bisilicate felspar (*Chin. pe-tun-tse*), to form the main ingredients. Natural hard porcelain is of dazzling whiteness, so hard that steel will not scratch it, impermeable to liquids and unaffected by acids. **Artificial soft porcelain** (Fr. *pate tendre,* such as old Sevres) in which glass or frit is used as a flux is never so white or hard. **Bone china,** made from calcined bones, phosphate of lime, is somewhere between these two in hardness, impermeability and whiteness. **Electrical** or **high tension porcelain** is porcelain in name only. The first true porcelain was discovered and made in Europe in 1709 by John Frederick Böttger in Dresden.

*Preparation of Clays.* Primitive man found that by searching for the more pure primary clays along the river beds or in the crevices in caves, his pottery was better. He had only to remove the coarse stones and other rough foreign materials, add water and knead the clay until it was uniformly soft and pliable. It is still prepared in much the same way today for handmade pottery. This process is known as **wedging.** A vast improvement in pottery was made when man learned to wash the clays of levigation, settling or straining making a more smooth, compact piece.

The preparation of clays for mass production of pottery is not basically different. The usual procedure is to weigh the mined, washed, dried clays to the desired proportions. They are then ground and mixed with water in a **blunger,** which is a huge tank with revolving arms for disintegrating and mixing the clay with water. The clay is now about the consistency of cream and is called **slip.** The slip is then strained through silk lawns to remove impurities and if a white body is desired, large magnets are used to remove the metallic iron. It is now ready to be used for one process known as casting. If it is needed in a more firm plastic state the excess water may be driven off by heat in a **slip kiln.** Another method is to put the slip through a **filter press.** By this method the slip is pumped into the center of a series of flat circular canvas bags which catch the clay allowing the water to seep out. The press is then tightened to squeeze out additional water and the clay is removed in the form of large pancakes. Clay is usually stored to age in this state. By proper moisture control bacterial growth is encouraged to accelerate colloidal degeneration which makes the clay tough and more easily worked. After it has aged it is put through a **pug mill** which wedges the clay by grinding and mixing until it is a uniformly homogenous mass, ready for use.

*Forming of Pottery.* In the beginning man's tools were his hands and fingers, sticks and stones. His first crude pots were squeezed into shape or a ball of clay was rolled and the center scooped out. Some may have been pounded over a smooth round stone and allowed to harden enough so that it would hold its shape when removed. Tiles were also made in this way, the clay being pounded out on smooth flat stones to the desired thickness. Another method was to roll out strips of clay and then by placing one coil upon another, working them together with his fingers, a hollow pot was formed. This same method is still used today and is known as **building.**

The most important change came about in the development of the **potter's wheel.** At first it was probably a simple flat stone disc, turned by hand. It was later mounted on a vertical shaft. By placing a lump of soft clay on the disc and turning, the clay was allowed to pass between the palm and the fingers forming a hollow round pot. Pictures of this type wheel are seen in the paintings on the walls of Egyptian tombs.

By extending the shaft and adding another disc at the bottom it was possible for the potter to turn the wheel with his feet, leaving both hands free to form the pottery. By pressing against the soft lump of clay, as the wheel revolved, a smooth round ball was formed. Then by pushing the thumbs down into the center of the ball and pulling outward and upward against the hands the even-

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

walled round pot was formed. Some of the more complicated Greek and Chinese shapes were obviously thrown in several pieces and joined together while still damp. This same method, known as **throwing**, is still in use today.

There are many variations of the foot powered wheel. They may be pedal driven or others have a large weighted wheel at the bottom of the shaft. By pressing the foot downward and kicking forward the heavy wheel will run for some time. They are known as **kick wheels.**

Sometime later the power was supplied by a helper and more recently they were motorized. The modern equivalent for mass production is the **jigger** or **jolly.** This machine makes it possible to turn out large quantities of pieces which are alike. The **jigger head** is a metal shaped bowl into which a plaster of paris mold is placed. This mold has an impression of one side and as deep as the thickness of the piece of ware to be made. One of the **jiggerman's helpers,** the **batter-out,** selects a piece of clay and flattens it in the shape of a thick pancake and slaps it onto the mold. The **jigger arm,** which is suspended over the mold, has a scraping tool cut in the profile of the opposite side of the piece to be made. This tool is pulled down until it comes in contact with the clay, the mount of which is allowed to pass between ıe revolving mold and the profile is the ece of ware. It is allowed to dry on the .old, which may be used again when the piece has been removed. The latest development is an automatic jigger, which mechanically turns out several thousand pieces a day.

Pottery may also be made in a **press.** The leather hard clay is pressed between oil-lubricated revolving steel dies. Inasmuch as the clay contains little water the piece may be handled as soon as it is formed. These methods have definite limitations, handles, spouts and ornaments must be added. More complicated shapes with these projections are more easily made in molds.

Plaster of paris is used to make **molds** for pottery because it has the quality of absorbing water from the clay. After the original piece has been modeled a **block mold** is made and a mold made of this is called the **case,** from which the working molds are made.

The older method was to press or **pug** the clay into the molds by hand, allowing it to harden before removing. If a complicated piece was to be made, it was necessary to make it in several pieces and stick them together while they were still damp. The newer method is known as **casting** or **moulding.** The clay is thinned to about the consistency of cream, called slip, and is poured into the mold. The plaster absorbs the water from the slip causing a hard shell of clay to form. The longer this slip is allowed to remain the thicker the wall of the piece becomes. The surplus slip is then poured out and after a short drying period the mold may be opened and the complete piece, including handles, ornaments, etc. may be removed. This method is used almost exclusively today for the reproduction of art wares.

After the forming by any method a certain amount of finishing must be done. Built pieces may be scraped, thrown pieces turned, or those made in molds may have the seams removed by cutting, scraping or sponging. All ware formed but unfired is called green.

Many of the methods are the same in the preparation and forming of porcelain, although it is not usual to shape it by hand. A combination of pressing, throwing and jiggering is common, but perhaps most porcelain is made by casting. Porcelain slip is sometimes called **pulp.**

*Firing.* Perhaps the most vital change in ceramics comes about in the firing. In early times and in some places even today, pottery and bricks were sun baked. When man first intentionally fired clay is not known. Perhaps quite by accident, clay-lined grass baskets may have burned, destroying all but the clay lining, which was now hard and permanent. At first a fire was built over and around the pieces, but this had its disadvantages in uneven firing, causing warping and smoke discoloration. The most simple type oven or **kiln** has not changed very much from the kind used by the Egyptians and Greeks and they are still in common use in the Far East. Mass production methods required greater capacity and evenness or control of fire and larger kilns were developed. These were all **periodic kilns,** requiring the stacking of the ware, firing and then a cooling period before the kiln could be emptied. There were variations in direction of fire, such as updraft or down-draft, etc. The **muffled kiln** allowed the fire to pass through flues, heating the interior through the inner walls. The newer types are **continuous, tunnel kilns.** The time wasted in heating and cooling of periodic kilns has been overcome by placing the ware on cars which enter one end of the tunnel, travel slowly toward the firing zone which is

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

somewhere near the middle. This gives the ware a chance to heat gradually until it reaches its highest temperature and then pass on slowly cooling, until it emerges at the other end. The firing zone in this kiln is continuously hot.

The newest type is a **merry-go-round or circular kiln.** The principle is the same as the tunnel, except that the cars travel on a circular track. One section being open allows for loading or unloading without stopping or removing the cars. Whether the kilns are for biscuit, gloss or decorating determines the size and control of fire. Fuels which might be used are wood, coal, oil, gas or electricity. The firing time may vary from a few hours to several days. In early times temperature was probably judged by the length of time the fire was kept going. **Optical pyrometry** which is the using of an experienced eye as a judge to determine the temperature by the color of the flame or the color of the objects in the flame was used before the development of **pyrometric Seger cones.** These are small cones made of various types of clays, carefully controlled to melt at certain heats. They were placed in various parts of the kiln to be visible from the outside and arranged in groups to melt in sequence. They range from cone 022 (1094° Fahr.) to cone 36 (3362° Fahr.). Most modern kilns are equipped with pyrometers, but cones are still used as a check for variation of heats in different parts of the kilns.

**Saggers** are refractory clay boxes in which the ware is placed to protect it from the direct contact with the flame. They also facilitate the stacking and are made in many shapes and sizes to accommodate the ware and allow circulation of heat between the bungs. Strips of moist clay, **wads,** are laid on the rim of the saggers to make a bed for the superimposed saggers and seal any openings between them. Fine sand is used as a cushion in the bottom of biscuit saggers. **Glost saggers,** used for firing glazed ware, have vertical rows of triangular shaped holes punched part way through the inner side walls into which pottery pins are inserted. These pins support and separate the pieces to prevent them from sticking together while the glaze is being fired. Ware placed on the bottom of the sagger rests on **bitstone.** Ware which has been fired once is known as **bisque** or **biscuit;** when glaze is applied and fired it is known as **glost ware.**

*Glazes.* The study of glazes is one of the most fascinating and unlimited phases of ceramics. Although they are of infinite variety, all of them are actually layers of molten glass fused to the surface of clay by firing. This coating of glass seals the surfaces of porous clay, making it smooth, shiny, hard and water tight. Potters have always been jealous and secretive about their glaze formulas and many of them have been handed down from father to son through many generations. Each age has contributed some new development or use.

As with most other phases of ceramics, the origin of glazes is not known. Whether it originated in Egypt, Assyria or the East is hard to say. The oldest known fragment is one bearing the name, in violet glaze, of King Mena about 3,000 B.C. However, the complicated technique suggests a much earlier period of development. The finest and most complete use of glazes and colors came in Egypt in the 18th dynasty.

There are several distinct types of glazes, each being best suited to a particular body. Preferably, body and glaze should have a similar coefficient of expansion. The first and oldest type is the **alkaline glaze.** It is made by the fusing of quarts sand (silicic acid) with an alkali, potash or soda. It was used by the Egyptian, Persian and Syrian potters and its use was carried on for thousands of years in spite of its shortcomings. Its use spread very little because it will not adhere to ordinary potter's clay. It must be used on a body which has something in common with it, i.e., a clay which is made up largely of silicious sand. This particular type of clay is very difficult to work unless mixed with a more plastic clay. Not every district had both kinds and as a result its use was continued only in certain places, while unglazed ware was made generally. It is a clear transparent glaze and may be stained with oxides of metals.

The next and most important type is **lead glaze.** This plumberiferous glaze is made by the addition of oxide of lead and will adhere to almost every type body. For this reason it is most widely used. It is as transparent as glass and may also be stained with various oxides. By the addition of tin oxide a **tin glaze,** a stanniferous, opaque glaze is formed. It hides the clay with its opacity and made the use of white slips to cover colored bodies unnecessary. This opaque enamel completely changed the whole character of many types of pottery and new styles resulted. It was used on Assyrian and Babylonian pottery and they also used it on their monumental archi-

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

tectural, and sculptured tiles. It may also be stained with oxides of metals and its use spread all over Egypt. We see it on the Hispano-Moresque wares, Italian **maiolicas**, Persian tiles and the Dutch **delft ware**, etc. In France it is known as **faience** (fayence or fayance), serving as an enamel base for painted decoration. Rouen became the center of a thriving faience industry in 1644.

**Feldspathic glaze** is used on hard porcelains. (Felspath, feldspar, felspar), is an essential part of nearly all crystalline rock containing silica, alumina and potash. It fuses with the body making one hard mass.

Another type is **salt glaze.** It is used on stoneware. When the temperature has reached its highest peak in firing the clay, common salt is thrown into openings made especially for that purpose in the kiln. The salt vaporizes and the soda in it combines with the silica on the surface of the ware to form a covering of soda glass.

*Decoration.* Although there are limitless varieties of shapes and forms possible in ceramics, the potter almost from the beginning has taken delight in adding some sort of decoration to his wares. At first these decorations were merely impressions made by his fingers or scratches made with sticks. Sometimes the surface was carved or incised or modeled in relief. Another method as seen in the Byzantine pottery and also in the later stoneware was to make wooden stamps and press them into the surface of the ware. At times these impressions were filled with various colored clays. Ornaments of all types were pressed in separate molds and attached while the clay was still damp.

Colored clays were found in a wide range of shades from white to grey, buff, cream, yellow, red, brown to black. They all have a characteristic dull, earthy appearance which makes them blend beautifully together. These colored clays could be thinned down and painted on, one over the other to form striking patterns. Another method of application was to squeeze the slip through the fingers and work the details after it was applied (barbotine). Some of the earliest Chinese pottery, about 3,000 B.C., was painted in red, black, purple and white clays over a buff or red body. This use of colored slips or **engobe** (Fr.), may be seen in a great deal of pottery today, having been applied by brush, spraying or dipping.

By combining the use of engobe with the earlier method of incising, a new style was developed known as **sgraffito** (It.). The red body was covered with a coating of white slip and the decoration was then cut or scratched away, allowing the red body to show through. The ware was then fired and left either in the bisque or was covered with a transparent clear or colored lead glaze. The best sgraffito was probably made in Bologna, Italy. One type of glazed sgraffito ware is known as **mezza-maiolica,** or half maiolica. The already fired red earthenware was dipped in white slip and the decoration was then scratched away. An easily fused metallic stain was daubed on, covered with lead glaze and then refired. These methods are still used today for fine decorative wares. The former Cowan Pottery in Cleveland, Ohio used a similar method and it was known as **drypoint.**

*Colors.* Because colors used in making pottery must stand relatively high temperatures in firing, oxides of metals are used. Some of the primitive tribes used stains made from boiled bark and plants to color their pottery. The acid in unripe cocoanut husk formed a black color when strips of the husk were placed over the pots but not fired. Various types of fuels for firing also gave black coatings which have been widely used. None of these methods of coloring are so permanent as metals. Native earths containing cobalt, iron, manganese and copper were found and used.

The height to which this simple process of painting metallic oxides directly on clay advanced is best seen in the Greek vases. These pieces were formed, given a light fire and then polished until very smooth. The black figures, probably iron oxide and manganese, were painted on, the small details were scratched out and then refired, giving the surface a beautiful dull sheen. The red figures on a black background were done in the same way, except the background was painted, leaving the red of the body show through.

On a light colored body or on a light slip, copper gives blue, but combined with a little iron, green. Cobalt, gives blue; with manganese, violet; titanium, yellow; iron, brown. When used as underglaze colors these oxides are applied directly to the bisque, and are glazed and refired. The big advantage in using underglaze colors is that they are more resistant to wear because they are protected by the glaze. The high fire necessary to fuse some glazes limits the range to fewer colors and darker shades. These colors may be brushed, sprayed or applied by print.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

Underglaze prints are made from copper plates, the process is similar to that used in making etchings. They are also made from steel engravings or lithographic stones. They are printed with underglaze color on thin tissue. The print is placed face downward and rubbed until the color adheres to the ware. It is usually necessary to harden on (light fire to burn out the oils used as a medium, to prevent glaze from crawling, pitting or bubbling) a color before the glaze is applied over the print and then refired. Here again the range of colors is limited. Aside from art wares it is widely used for hotel and other commercial ware.

Colors play an important part in glazes. To the layman who is not interested in glaze structure, color is the all important thing. We think of the Egyptians for their rich blues and green glazes, the Persians for their deep blues, the glorious rich blood reds (sang-de-boeuf) of the Hiang-hsi period, or the misty blue and green celadons, the delicate peach-bloom and plum colors of the Chinese, or the dark brown of English Rockingham. We think of Della Robbia for his thick white, blue and yellow enamels. Many of these colors have been made from the same oxides of metals; the clay, application, type of glaze and conditions in firing account for the differences.

Most wares are glazed all over, inside and out, but this is not always necessary. The Chinese as well as others, very often glazed only parts of their pieces, getting a striking contrast between the high shine of the glaze and the dull rough appearance of the bisque clay. This method is often used in American and other modern ceramic sculpture and pottery. It is also possible to apply glazes in patterns; this was popular with the Viennese.

Another interesting use of color and glaze to form decoration is found in the *Chinese crackle*. At first the method was the relatively unreliable one of plunging the hot piece of pottery into cold water causing the glaze to craze. These crazed marks were often accented by rubbing color into them. If metallic colors were used they could be refired and by allowing normal cooling the surface would be tight, leaving the pattern of the old craze underneath. Later, by the addition of a certain kind of stone (probably pegmatite) which was mixed with the glaze there resulted a disturbance of the relationship of body and glaze and a crackle was assured. The size and location of the crackles were controlled by the number of layers of this glaze used.

The interesting feathering of glazes and the crystalline formations, although at first accidental, were later controlled to produce another series of stunning effects.

When tin enamels were developed a distinct decorative style known as **maiolica** (majolica) was produced. It gets its name from Majorca, the largest of the Balearic Islands with which Italy carried on commerce as early as the 12th cent. Actually it was used to describe the wares imported from Spain in Majorcan trading ships. In Seville and Toledo, enameled tiles were produced, some were cut to form geometric patterns and others had the tin enamel separated to form the design. The enamel was kept apart by painting the spaces between with manganese and greasy medium (de cuerda seca). Tiles were later made with raised dividing lines molded in (de cuenca).

The Italian maiolicas are of earthenware bodies covered with an opaque tin enamel which served as a base for painting. The oxide colors mix somewhat with the glaze during firing, causing the pattern to be not under the glaze or over the glaze but actually in the glaze. In order to make this effect even more prominent a thin transparent glaze was often sprayed over the top and refired to thoroughly cover it.

As we have already seen, the high temperature necessary to develop most glazes limited the range of color. It was later found that these colors could be put on top of the body—overglaze. After the application of overglaze color the ware is again fired, but at a point much lower than it took to melt the glazes originally, but enough to open the surface so that the fluxed colors can attach themselves. These colors are less stable because they do not have the glaze as a protective covering.

One of the first types, probably discovered in the East, but famous on the Hispano-Moresque ware was the **lustre.** These differ from other metallic pigments in that they have an iridescent, reflecting surface. They are made from compounds of sulphur and copper, silver and iron. They may be applied by brush to the surface of fired opaque or transparent glaze and refired in a muffled kiln and become fixed to the surface. Lustres were used throughout Europe, especially by the Italians and the English. Imports to this country were in demand during the 18th and 19th cents. Some is still being made, although the use of gold and platinum has become much more popular. Golds are of two types, coin and bright. Coin gold is made by care-

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

fully grinding pure gold, quicksilver and flux. When fired and burnished with sand it has a dull, rich sheen. Bright gold is brilliant when fired without burnishing. Gold is also used for many overglaze colors such as reds and pinks as well as the base for fine ox blood glazes. Golds are applied in liquid form, the banding and ornamentation of handles is done with a brush by **gilders** and **liners**. It may also be applied with a rubber stamp for small filigree or intricate patterns.

Overglaze colors are brilliant, bright and limitless, but they are never so rich because they appear more thin and on the surface. Bands and lines are applied by brush while the piece is revolving on a **liner's wheel**. The **air brush** is also widely used for covering larger areas, **masks** made of rubber or metal being used to control the color areas.

Although at one time there was a great craze for hand painted china there is very little made today. It is a slow and expensive process and in order to make ware with the intricate floral patterns at popular prices a process known as **decalcomania** was developed. By the use of lithographic stones the patterns are printed on a special paper. The **decal** is applied face downward on the piece of fired glazed ware, which has been sized with varnish. A stiff brush is used to rub the color onto the size and the paper is then washed off. During the firing the varnish and oils used in printing are burned away and the colors are fused into the surface of the glaze. New methods of decal printing have recently been developed which give a greater smoothness and a more faithful reproduction of the artist's original drawing.

*Ceramic Sculpture.* The making of sculpture in fire clay has followed closely the developments in the making of pottery. The methods are much the same, so far as the preparation of clays and glazes. The method of forming depends a great deal upon the type of clay used and the size of the piece to be modeled.

For the making of unique pieces it is possible to model directly in fire clay. It is necessary to use a good plastic clay and knead it with the hands until it is of an even, firm consistency. There are several methods of modeling and they differ from regular sculpture in that no armature is used. Due to the fact that considerable shrinkage takes place in both drying and firing, the armature would prevent this action causing the piece to crack or break apart. It is advisable to have a hollow, even-walled piece to prevent uneven shrinkage. These handicaps are overcome by modeling in the following ways.

The most simple method is to build the piece of sculpture solid and hollow it out later. It is best to build up with small enough pieces of clay to insure all air being squeezed out, so that no air pockets remain within the mass. During firing these would expand and cause the piece to explode or crack. The piece must be kept damp to assure adhesion of the added clay and again prevent uneven shrinkage. After the sculpture is completed, with perhaps the exception of the fine detail, it should be allowed to stand and harden only enough so that it can be handled without distorting the forms. If it is a broad based piece it may be hollowed out through the bottom. If it is rather complicated it may be necessary to cut it apart, hollow out each section and then reassemble them. These joints must be thoroughly worked together and the surface remodeled.

Ceramic sculpture may also be modeled by the coil method, the same as that used in building hollow pottery. It is imperative that the piece be thoroughly conceived, because it is modeled complete from the base up, the clay being allowed to harden enough to support the succeeding layers. A hole must be left somewhere in the piece to allow the air to escape during firing. It is possible to build clay supports on the outside of the piece to prevent the damp clay from sagging. This clay will shrink with the piece and may be removed after the piece is dry or has been fired.

Some decorative sculpture may be thrown on the wheel. In this case sections are thrown and then put together while still damp. Additional modeling of the surface forms may be done after it is assembled.

For larger architectural sculpture a rough terra-cotta clay may be used. The **grog** (fired clay which has been ground) which is added to fresh unfired clay gives an interesting coarse texture and reduces shrinkage and eliminates much of the strain and decreases the possibility of cracking.

It is of course possible to model with regular modeling clay with an armature and then make a plaster mold to form the final piece. Fire clay may be pugged or pressed into the mold, the piece being removed when it is hard enough to prevent distortion in handling. If the sculpture is complicated it may be made in several parts and then joined

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

while they are still damp. Additional small detail may be added to the surface.

The method most widely used for reproduction of sculpture in quantities, is casting. In this case slip is used, being poured into the mold and allowed to remain until the desired thickness of wall is formed. The surplus slip is removed and after the piece is hard enough to handle it may be removed from the mold. Because of the difficulty in handling porcelain clay this method is used almost exclusively.

A great deal of ceramic sculpture is left in the bisque, especially when the clay used is interesting in color or texture. Additional interest may be given the bisque by the use of colored slips or stains. Sometimes partial areas are glazed and the contrast of the dull bisque and shiny glaze is very effective The complete range of glazes used on pottery, from the thin transparent lead or salt to the heavy opaque tin enamels, mat or shiny may be used. If the heavy glazes are used it is necessary to overmodel the detail so that it will not be lost.

The firing of ceramic sculpture is the same as pottery, although, due to the uneven forms a longer drying and heating period is recommended.

Ceramics, although still a craft, has grown to a great industry. Most potters are born into the trade and the knowledge and understanding has been handed down from generation to generation. There is something about it that seems to fascinate and hold you to it; it may be the soft plastic feel or the smell of moist clay, or perhaps the glowing highlights of brilliant colored glazes or the dull earthy tones of bisque. As an industry it is often considered to be the most backward, perhaps because it is so old. Even with mechanical equipment in modern plants a piece of pottery may pass through as many as forty potters' hands. To the studio potter it is a constant challenge, full of disappointments and pleasant surprises.

America need no longer consider its commercial ceramics inferior to any produced in the world and in the field of art, pottery and ceramic sculpture is gaining world-wide recognition. See *Pottery and Porcelain, Vol. 1,* Emil Hannover, 1925; *Pottery and Porcelain, Vol. 2,* Emil Hannover, 1925; *The Ceramic Art,* J. J. Young, 1878; *Chinese Ceramic Glazes,* A. L. Hetherington, 1937; *Ceramic Dictionary,* C. Merts Franzheim, 1924.

—V.S.

**CERAMICS II: history of pottery and porcelain.** The word ceramics, as a general term, is internationally used to define the study of the potter's art. The term pottery, then, broadly covers the entire field of clay products from bricks to porcelain or ceramic sculpture that takes its place with the fine arts.

The story of pottery goes back to the farthest reaches of prehistoric times, to a date unknown. Perhaps between the years of 10,000 to 2,000 B.C. Neolithic man was the pioneer potter of the world. From a study of primitive vessels made in many countries, it is apparent that in the very dawn of civilization the first objects of clay were constructed to contain food and drink. We know that at 6500 B.C. or even earlier the Sumerians in their stoneless valleys of the Euphrates used sun-baked clay for building bricks, for pots, for pottery images that were perhaps the most remote ancestors of the ceramic sculpture of today; and for clay tablets upon which they wrote.

*Egyptian Pottery.* The story of Egyptian pottery goes back to prehistoric, sun-baked bricks made from Nile mud by enslaved Hebrews who were taken captive in war, and forced to build the fortresses of Rameses; while at the same period in Assyria and Babylon primitive pottery was being made. But altho the potter and his art are frequently mentioned in the Scriptures, very few specimens of Hebrew pottery have been discovered, and the Mosaic law forbids the making of "graven images".

EARLY EGYPT AND THE OLD KINGDOM, 4500-2475 B.C. Bottles and vases of clay, contemporary with the Pyramids, were made with the potter's wheel (invented when or where we know not), as well as with other tools such as the lathe and moulds for stamping, and glazing was understood and practised.

MIDDLE KINGDOM AND EMPIRE, 2160-1090 B.C. This period of wealth and magnificence included the craftsman's development of the brilliant blue glaze used for tiles and bowls, and skilfully baked in ovens constructed long before any devices for the regulation of the heat had been invented.

The art of Egypt, it must be remembered, including its pottery, was designed for use as well as for beauty; it served in the tombs as a protection for the souls of the dead; and it was employed by the Pharaohs to dazzle the common folk and to bolster their own power and importance.

*Greek Pottery.* The most remarkable craft of all antiquity was the Greek pottery, the

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

development of which has now been traced from the Neolithic age, with Neolithic finds at Cnossus on the Island of Crete as ancient as any that have ever been unearthed. But in the early or archaic period, Greek pottery was derived from the Egyptian, whose wares were brought to Greece by Phoenician merchants.

Despite the Egyptians' earlier knowledge of it, invention of the potter's wheel was claimed both by the city of Marathon and by one Talos, the pupil of Daedalus, who, say the ancient records, "being cleverer than his master, invented the potter's wheel."

GREEK VASES AND VASE PAINTING, 2500-400 B.C. The story of Greek pottery is primarily the story of the unsurpassed Athenian vase. Marryatt tells us that a part of Athens was called *"Keramicus"*, from being inhabited by potters, and that their masterpieces were not only publicly exhibited, but were often filled with oil from the sacred olive tree in the Acropolis, and given as prizes to the victors in the Olympian games.

The vases of the early archaic period, from 2500 to 600 B.C. reveal animal and plant designs; the **black figured vases**, with designs illustrating legendary and mythological themes, date from about 600 to 500 B.C. while "the perfection of vase painting was between 480 and 450 B.C.", when the **red-figured vases** were produced. After the fall of Athens in 404 B.C. came the decadence.

*Roman-Arretine Pottery, 2000 B.C.-5000 A.D.* Following the decline of Greek pottery, a new kind of pottery was made at Arezzo, with these **Arretine vases**, as they were called, resembling the later Greek works on a smaller scale, and afterwards produced thruout the Roman world. The resemblance to Greek vases is explained by the fact that in the Punic Wars many Greek potters were taken prisoner, and, as a reward for their skills, were freed and honored by the Romans. Excavations in Britain have brought to light many examples of the best types of Roman pottery. About 100 B.C. stamps with the potter's name first appeared, usually with the name of the slave (who had probably made the vase) found beside that of his master.

*Etruscan or Greco-Roman Pottery.* Approximately from 1100 B.C. to the 3rd cent. B.C. pottery in imitation of the Greek products was developed in Etruria, Sicily, which also imported quantities of vases directly from Greece. Formerly called Etruscan, this ware is now called Greco-Roman, as it consisted for the most part of red and black vases made by Romans after the Greek pattern.

*Persian Pottery.* From 641 A.D. **Rhages pottery**, made in Rhages, a city that had risen to importance prior to its destruction in the 13th cent., was remarkable for its iridescent blue and green glazes. These glazes were also used in Syria and thruout the Byzantine Empire and were the forerunners of all the glazed pottery of Europe that was to follow.

The great Persian period was from the 10th to the 16th cent. From the 13th cent., these unexcelled artist-potters produced "Persian porcelain"—translucent, entirely different in quality from the Chinese porcelain—and lustre ware vases and plates, at once superb in form and design, and glowing in rich color. Their decorative tiles were used in Moslem mosques and other buildings. The earliest dated specimen of Persian lustre is of the year 1216 A.D., and after the 16th cent. Persian products deteriorated.

*Hispano-Moresque Pottery.* From the 8th to the 17th cent., lustreware, undoubtedly derived from Persia, was first brought by Saracen invaders into Spain. The Moors, whose conquests covered Spain, Sicily and North Africa, introduced glazed tiles into Spain about 711 A.D. and the term Hispano-Moresque means "Moorish influence upon the art of Spain." Famous examples of their work, with its metallic iridescence, are to be found in the Alhambra. In the East, tin had been as costly as gold; but it was in Spain, where tin was found in abundance, that the distinctive tin-enameled Hispano-Moresque wares with their extraordinary beauty of lustre were produced. This ware was made at Malaga, in the Moorish kingdom of Granada; at Valencia; and on the island of Majorca.

*Chinese Pottery and Porcelain.* "The Chinese were the greatest race of potters the world has ever seen." The name "chinaware" comes originally from porcelain made in China, which so surpassed all other types of pottery that the term has been used to denote any and all other types of porcelain wares.

Dr. Johnson's definition of porcelain, given in his dictionary of 1818, and apparently omitted thereafter from all subsequent dictionaries, is interesting because it gives factual evidence that certain superstitions anent the Chinese porcelains were firmly believed. "Porcelain," he wrote, "—*Porcelaine*—French—said to be derived from *pom cent années;* because it was believed by Europeans that the mate-

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

rials of porcelain were matured under ground one hundred years."

In their skillful guarding of the secret of porcelain making, the Chinese were wont to spin "tall tales"; and even Bacon wrote: "Porcelain is a kind of plaster buried in the earth and by length of time congealed and glazed into that fine substance." Another fable is that "porcelain was made of egg-shells and sea-shells, beaten small and buried in the earth for a hundred years."

The most recent excavations in the province of Honan have proved beyond doubt that pre-dynastic pottery must have been made as early as 3000 B.C. This pottery, not unlike Neolithic pots found in other parts of the world, consisted for the most part of funerary vessels and articles for everyday use.

*PORCELAIN.* Altho certain early records state that porcelain was invented at Siu-ping at about 185 B.C., the exact date of the first making of porcelain in China is actually unknown.

*Han Dynasty, 206 B.C.-220 A.D.* The pottery of the Han dynasty, mostly found in tombs, was primitive—part of it unglazed, with stamped or incised decoration. Much of it was glazed, however, and it is believed that glaze was used for the first time during this period: possibly a lead glass brought from the Roman Empire, with which China is known to have been in touch during the Han dynasty.

*T'ang Dynasty, 618-906 A.D.* Recent excavations due to the building of railways in China by European engineering companies have added to our knowledge of the pottery of this great period of China's expansion and power. Again it is objects found in tombs that show us the progress that had been made since the Han dynasty. There are innumerable figurines, with vases and bowls of "**porcellaneous stoneware**" or a semi-porcelain in many instances revealing unmistakable Greek and Persian influences. And the first appearance of the pale green, known as celadon, has led to the belief that real porcelain was made for the first time in China during this dynasty.

*Sung Dynasty, 960-1279 A.D.* This era corresponded to the Middle Ages of Europe. The best of the Sung porcelains, now exceedingly rare, and declared to be stoneware rather than "true porcelain", were made in the province of Honan, and also discovered there thru comparatively recent excavations. It was during this dynasty that the pottery of China became known outside of its boundaries and it is recorded that about 1171 A.D. "Saladin sent a present of forty pieces to the Sultan of Damascus". This was followed by the beginning of China's export trade.

*Ming Dynasty, 1368-1644 A.D. The Golden Age of ceramic art in China.* During this period porcelain was decorated with colors fired over the glaze for the first time and the use of as many as five colors on one piece was first achieved by these amazing artist craftsmen.

The city of Ching-Te-Chen was famous for its imperial porcelain factory established about 1506 A.D. by Hung Wu, founder of this dynasty. Here was made for the first time the celebrated **white porcelain,** called by the French *blanc de Chine,* and considered "the outstanding contribution of the Chinese to ceramic art"; and from this town and district thereafter came the finest ceramic products of China. The use of this white china was reserved by the Chinese for religious ritual and, as tableware, for mourning periods in their own homes.

From this era have come the unsurpassed cobalt blues, the gorgeous oxblood reds *sang de boeuf,* the green *famille verte,* the extraordinary "eggshell" fabrique and the perforated or openwork wares of many kinds, including the so-called "grain of rice" porcelain—all fired in the highest kiln temperatures ever known.

*K'ang-Hsi Dynasty, 1661-1722.* This is also an important ceramic period, "from a decorative point of view the best period in Chinese history", with glazes begun in the Ming dynasty perfected; the introduction of designs etched and embossed, the imitation of jade and marble and metals in unusual glazes. From this dynasty came the blue and white porcelain familiarly known as **"Old Nankin".** But altho the Ching-Te-Chin factory was *near* Nanking, the city of Nanking itself boasted no potteries. So the name "Nankin" probably came from the *port* from which this blue ware was shipped to Europe; and it is a fact that "from 3000 to 8000 pounds have been paid for black ground Chinese porcelain of the K'ang-Hsi dynasty—the Chinese wares commanding high prices owing to difficulties of importation." Even as in Athens for the Olympic games, porcelain vases were presented as prizes and rewards for valiant deeds, and the best artists were highly honored.

During the Ming dynasty, the demand for Chinese porcelain had arisen in Europe—the first exports carried by Portuguese ships, the

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

later ones by Dutch ships—leading to the tremendous efforts on the part of potters thruout the various European countries to reproduce this mysterious and beautiful fabrique: one of China's major contributions to world civilization.

*European Porcelains.* ITALY claims the first production of porcelain in Europe. From the fall of the Roman Empire, pottery making seems to have become almost a lost art until the 12th and 13th cents. when, after the conquest of Majorca by the Pisans in 1115 A.D. and the capture of many Moorish potters, work strongly influenced by the Hispano-Moresque wares was produced. It was 1420, however, before the first enamelled faience appeared with its tin glazes characteristic of Italian **majolica.** The word *majolica* is said to derive from the island of Majorca, originally called "Majorica", while *faience* is a French adaptation from the name of the town Faenza, the center for this particular craft. The superb 15th cent. majolica, produced at Faenza, the famous blue and yellow ware, is especially prized by collectors But after the advent of "true porcelain", with its superior fabrique, the production of majolica began to decline.

The **sgraffito** (Italian) process, a method of decorating by incised lines thru the slip coating to the red clay beneath, came out of medieval Italy, where, according to Picolpasso's ancient volume, *The Three Books of the Potter's Art,* the kiln at Castel Durante was closed with special ritual. "For," said he, "before fire is brought, care must be taken to observe the state of the moon. If the firing happens to take place at the waning of the moon, the fire lacks brightness in the same manner as the moon its brilliance."

LUCCA DELLA ROBBIA. Born in 1400, Lucca della Robbia of Florence, a pupil of Ghiberti. became perhaps the most distinguished forerunner of the ceramic sculptors who were to come afterwards. For with many orders to fill, and with the Dukes of Tuscany among his patrons, he turned to the more rapidly produced terra cotta figures, and evolved the beautiful white tin-enamel and other polychrome glazes that have long been associated with his bas-reliefs and sculptured Madonnas.

Venice claimed to be first in the production of porcelain—not only in Italy, but in Europe; but it is in Florence, under the patronage of the Medici, that at about 1580 the first "porcelain in imitation of china" was produced.

CAPO DI MONTE. This famous ware was made in a pottery established near Naples in 1736 by Charles the Third, whose consort, Queen Amelia of Saxony, is said to have brought the secret of porcelain making from Meissen; she was an enthusiastic patron of the Capo di Monte potters. And the King, it is recorded, amused himself by working in clay.

FRANCE. The enamelled wares of Italy passed into France about 1553, when the marriage of Catherine de Medici to Henry II took place, and Italian potters followed in her wake. There were potteries at Beauvais, Rouen and elsewhere; but it was at Saintes that Palissey, greatest of early French potters, evolved his fine enamel. After desperate struggles, he achieved success and the patronage of the King, which, however, did not prevent his dying in prison during the religious persecutions.

In 1696 porcelain of good quality was made at St. Cloud, "the invention protected by royal patent"; but later research now gives credence to the claim of Rouen's pottery manufactory that in 1673 the *first* porcelain of France was made there.

SEVRES. Stemming from the manufacture of porcelain at Vincennes, in 1756 the celebrated porcelain works at Sevres was built upon land owned by the Marquise de Pompadour, who was interested commercially in this project, and became the "Royal Porcelain Works" when Louis XV purchased the buildings and equipment four years later. Marie Antoinette brought knowledge of the Vienna potteries (supported by the Austrian court) to France when she arrived as a bride, and she gave many orders to the Sevres factory during her reign. The story goes that the kaolin needed for the manufacture of porcelain was accidentally discovered by a peasant woman near Limoges, who tried to use the white earth of the region as soap.

Famous colors of the Sevres fabrique are the yellow ***jaune de jonquil*** (the oldest one); the blues, ***bleu de roi,*** and the darker ***gros bleu,*** and the ***rose Pompadour,*** the latter often incorrectly referred to as ***rose du Barry.***

Production at Sevres was abruptly interrupted by the French Revolution, but was resumed as a national project under Napoleon, who, "for the glory of France" decreed that this important industry should continue as a national factory.

The first exhibit of art treasures "free to the public" ever held anywhere in the world was opened at the Louvre after the Revolution, and consisted of loot stolen from the

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

various palaces by the victorious Republicans. As large quantities of Sevres ware belonging to the court had been demolished or stolen, there was much demand under Napoleon for chinaware to replace the services that had been plundered. Thus began the era of monumental vases commemorating the victories of Napoleon, and the classical Empire designs.

Specialties of Sevres were the famous **biscuit groups**—portrait busts and figures, the work of Clodion, Pigalle and other noted sculptors; and the *pâte sur pâte* process—(successive layers of white and colored slip applied to a dark ground—an impasto decoration): The latter achieved by Louis Marc Solon from about 1762 and carried on under Taxile Doat, noted decorator and ceramist, from 1879 to 1905. Between 1880 and 1882, the great sculptor, Rodin, then a youth, was employed by Sevres.

Latest word, at this writing, of the world famous National Porcelain Manufactory at Sevres is the tragic report that it was bombed and wrecked in an R.A.F. raid in March, 1942. "According to a news dispatch, the pottery, in the district of Sevres, was close to a rifle bullet loading factory."

LIMOGES. The Limoges porcelain works was established in 1773, and afterwards annexed as a branch of the Sevres manufactory and discontinued in 1788: The modern Limoges (until World War II) a sort of French Staffordshire, with a number of porcelain factories that make the well-known Limoges tableware.

HAVILAND china was named for David Haviland of New York, an American who in 1840 established a pottery at Limoges (also producing prior to World War I).

GERMANY: MEISSEN. The first "true porcelain" made in Europe was produced at Meissen by John Böttger, a chemist accused of alchemy, who had fled from Berlin, and who, under the patronage of Augustus the Strong, King-Elector of Saxony—dubbed "King of China Maniacs"—founded the world renowned factory in 1709. This ware was called **Dresden porcelain**, as the Saxon court was nearby in Dresden. It is said that Böttger's factory was like a fortress, with his porcelain making secrets jealously guarded. In 1745, during the Seven Years' War, the Prussians under Frederick the Great attacked Dresden, looted the factory of its moulds and equipment and seized many of the workmen. This brought to a close the most distinguished period of Meissen production, for after this the Sevres porcelain factory became the most famous in Europe. Thus the later Meissen ware has consisted largely of pieces that were imitations of the French products that were in such demand.

VIENNA. The Vienna factory was founded in 1720 by a runaway foreman of the Meissen works. In 1744 the factory was bought by the Empress Maria Theresa, and, first stimulated by her patronage, the production of wares of the Meissen type that were notable for their brilliant colors and technical excellence continued until the close of the factory in 1864. The pre-World War II *Wiener Keramik*, in collaboration with the *Wiener Werkstätte* in 1907 had become well-known for its contribution to modern industrial ceramic art and for its ceramic sculpture.

DELFT. Dutch factories were in production in 1650, six years after the close of the Ming dynasty in China. At one time Holland "was the only European power to whom the Japanese allowed an entrance into their ports"—resulting in Japanese and Chinese imports that could be copied: hence the Oriental character of this well-known blue and white ware—(also in continuous production prior to World War II).

DENMARK: COPENHAGEN. In 1772 Meissen potters began the production of porcelain in Copenhagen, where, in 1779, the factory became the Royal Porcelain Works under the patronage of King Christian VII and has continued to the present day (prior to the Nazi occupation). The modern factory of Bing and Gröndahl, established in Copenhagen in 1853, has combined superlative craftsmanship with original and outstanding work, executing the brilliant sculptures of Paul Gauguin, Kai Nielsen and others—and, in consequence, attracting wide attention in international expositions.

ENGLAND. Chinese porcelain had been imported to England as early as 1506, and gifts to Queen Elizabeth of "white and green porselyn" are recorded in 1587. In 1671 John Dwight of Fulham produced a "porcellaneous stoneware" which he called porcelain and which was somewhat similar to the Meissen products. In 1755 Richard Chaffers of Liverpool discovered "soap-rock" in Cornwall, and achieved a fabrique resembling the eagerly-sought Chinese ware. His first successful piece, it is told, was presented as a gift to his famous rival, Josiah Wedgwood.

Porcelain factories, with their products unmistakably related to those of France, were being established at Chelsea (where figures were derived from Boucher's paintings) and

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

at Bow (known as "New Canton") in 1744; at Derby and at Worcester in 1751; while in the same year, "The case of the Undertaker of the Chelsea Porcelain protested imports from Dresden that were so detrimental to English manufacture".

It was 1768, however, before "hard porcelain" from native materials was first made in England by William Cookworthy, a Plymouth chemist, who also used the clay or "soap-rock" obtained from Cornwall. This factory, the forerunner of the celebrated potteries that came after, removed to Bristol in 1770, where it was carried on by Richard Champion until 1781, and afterwards absorbed by a group of Staffordshire potters.

With due respect to William Cookworthy, in the dispute as to who should be first, Thomas Frye of the Bow Manufactory contrived to have himself commemorated on his epitaph as "The Inventor and First Manufacturer of Porcelain in England"!

JOSIAH WEDGWOOD (1730-95) of Staffordshire was not only the greatest potter England has produced, but one of the greatest of all time. Born in 1730, the descendant of a century of pottery makers, he established his workshop at Burslem in 1759, when Queen Charlotte became his patron. Here, according to his epitaph, "Wedgwood converted a rude, inconsiderable manufactory into an elegant art and an important part of national commerce"; and his early experiments led to the beautiful **jasper ware**—stoneware with white classic designs in relief upon a blue ground: His masterpiece in this ware generally conceded to be his reproduction of the great *Barberini* or *Portland Vase,* the original of which was obtained from the Duchess of Portland's collection. (Two numbered copies are in the British Museum and Victoria and Albert Museum in London.) In fact, it was his love of classical designs that led him to name his pottery for *"Etruria";* and it is known that he imported Italian designers and sculptors to make copies of bas-reliefs in Rome.

It was after he had executed his famous service of 1300 pieces for Empress Catherine of Russia, which was exhibited in London in April, 1774 prior to its shipment, that Wedgwood became the most renowned potter in Europe. So influential was he that, exasperated by slow transportation for his mounting volume of orders, he was instrumental in obtaining better roads, and, of even more value, the development of canals thruout England.

So far as is known, a number of the original moulds are still in use in the Wedgwood Pottery in Stoke-on-Trent, England. For it will be remembered that "the Potteries" in the district of the "Five Towns" (including Burslem) were united in 1910 to form the city of Stoke-on-Trent.

Other notable figures in the story of English pottery include Josiah Spode, who began work in 1756 and Dr. Wall, who founded one of the most important of the English factories at Worcester.

LOWESTOFT. The Lowestoft factory, begun in 1756, produced ware the oriental designs of which stemmed from Chinese imports brought to Britain by Dutch traders. It is also known that a considerable quantity of so-called "Lowestoft" consisted of pieces made in China and afterwards decorated in England. The genuine Lowestoft did not possess the hard fabrique of the Chinese.

RUSSIA. The porcelain works established in 1744 under imperial patronage at St. Petersburg, now Leningrad, continues today as the State Porcelain Works. The following, direct from Soviet Russia, is interesting in its bearing upon the postwar future: "True Soviet art has been based on a highly developed industrial technique. This new movement in art known as 'constructivism' reflects the ideology and outlook of the technical workers and keeps production and industry constantly in view. Some of the artists identified with this trend, who are also productive workers in the pottery, glass and textile industries, have created beautiful examples of the applied arts, as, for instance, the wares of the State Porcelain Works at Leningrad. These artists will play an important part in remoulding living conditions among the masses and in creating characteristic Soviet styles not only in pottery and chinaware, but in other articles of daily use. Underlying all these efforts is the principle of every revolutionary artist—'Art for the toilers!'"

*American Ceramics: The U.S.A.* That the Americas also have an interesting pre-historic past, with aboriginal pottery of unknown date found in various sections of both North and South America is a fact vouched for by innumerable collections in museums of art and archaeology. Of special interest are the mound-builders' pots and the striking Indian pottery, the latter being reproduced today by the same primitive methods in pueblos of the Southwest.

It is known that as far back as 1612 "tylemakers" were at work in Virginia, where

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

pottery of various crude types was made; and that in 1685 the first white ware manufactured in the Colonies was produced at Burlington, New Jersey — this ware referred to in records of the Bodleian Library at Oxford as "white and chiney ware", made in a pottery "with all necessary implements and diverse workmen", financed by one Dr. Daniel Coxe of London.

In 1735 John Remmey, a German, built a stoneware factory in New York, which was carried on by his descendants until 1895; and by 1750 over a hundred potteries of German origin were functioning in Pennsylvania. The earliest dated example of the Pennsylvania German slip decorated ware, popularly known as "Pennsylvania Dutch", is a carved white dish of the year 1762.

Back in 1745 we hear of William Cookworthy, England's first maker of porcelain "from native materials", importing the much-sought necessary kaolin, which he describes as "china earth", from Virginia, where several potteries were being carried on.

The Jugtown Pottery, still in existence in North Carolina, is said to date from 1750, when its first potter arrived from Staffordshire. In 1765 and 1766 certain "china clays", discovered by Indians in the Great Smokies, and dubbed by them *Unakah* (meaning "white") were shipped from South Carolina to the Worcester and Bristol china works in England. And it was an unsuccessful South Carolina pottery which, operated by a Staffordshire potter named Bartlem in 1766, caused Josiah Wedgwood undue alarm. For, wrote the famous English potter, who incidentally was himself importing "china earth" from the Carolinas and from Florida: "This trade to our Colonies we are apprehensive of losing in a few years, as they have set on foot some Pottworks there already, and have at this time an agent amongst us hiring a number of our hands for establishing new Pottworks in South Carolina."

It was actually 1769, however, before the manufacture of fine white china was undertaken in the U.S.A. The announcement as given out by Gousse Bonnin, who had been trained at Bow, England, quaintly stated: "Notwithstanding the various difficulties and disadvantages which usually attend the introduction of any important manufacture into a new country, the proprietors of the china works now erecting in Southwark have the pleasure to acquaint the public, they have proved to a certainty that the clays of America are productive of as good Porcelain as any heretofore manufactured at the famous factory in Bow, near London." It is recorded in the History of Independence Hall that in 1771 this factory petitioned the Assembly for financial assistance. "For," said the proprietors, in part, "We, at our sole Risque and expense introduced into this Province a Manufacture of Porcelain or China Earthenware, a commodity, which by beauty and excellence, hath found its way into every refined Part of the Globe — — — America, in this general Struggle, hath hitherto been unthought of — and it is our peculiar Happiness to have been primarily instrumental in bringing her forward; but how far she shall proceed, in a great Measure, depends on the influence of your generous Support." The "generous Support" was evidently not forthcoming, and this abortive attempt at fine porcelain making came to a sad end in about two years.

Even as in Europe, other unsuccessful efforts to produce porcelain were made by divers potters thruout the country. But it was 1825 before William Ellis Tucker, the son of the proprietor of a small china shop in Philadelphia, discovered kaolin in Chester County, Pennsylvania, and first achieved "true porcelain" in these United States. His success was remarkable for, utterly unaided by the previous experience of others in the field, "he succeeded in a few years in perfecting from new and untried materials a porcelain equal in all respects to the best which England had produced after eighty years of continual experiment": the materials being taken from our soil "in great abundance and purity.'

Tucker's appeal to Congress for financial aid is also recorded in old Philadelphia archives, together with an interesting—and interested—letter from Andrew Jackson, who assured the applicant that "it would give him much pleasure to promote the objects he had in view, so far as they were within his constitutional sphere." Two months before Tucker's death in 1832, this ambitious potter had made another futile appeal to Congress for the passage of a tariff bill which would protect him from foreign competition, and Henry Clay had replied: "Such is the state of parties here, the friends of protection combating against the Treasury bill, sustained by the whole weight of the Administration, that it is extremely difficult to anticipate results or any part of the Tariff."

The firm continued under the name of Tucker and Hulme (later Tucker and Hemphill), for the most part turning out decorated copies of Sevres pieces for wealthy families

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

in Pennsylvania and New Jersey, and finally came to an end in 1838. Thereafter, Thomas Tucker, William's younger brother, resigning himself to the craze for European wares, turned from the making of porcelain to the more lucrative pursuit of importing it from foreign shores. A few excellent specimens of this now rare "first American porcelain", for which only over-glaze colors were used, are to be found in the Barber Collection in the Philadelphia Museum of Art.

Early American potteries included the one at Bennington, Vermont, begun by the firm of Norton and Fenton in 1793, which was famous for its **Rockingham ware**, a yellow fabrique glazed with dark brown, and named for the Marquis of Rockingham, upon whose estate a similar ware had been originated at the Swinton Works in England. This American ware had a special showing at the first world exposition at the Crystal Palace in London in 1851, displaying objects that ranged from the favorite "Rockingham Lion" to pitcher-basin sets and cuspidors in infinite variety. The Bennington factory also specialized in **Parian ware**, the name derived from ivory white marble found on the island of Paros, Greece, and was carried on for more than a century.

1839 witnessed the founding of the pottery industry in East Liverpool, Ohio, a district which was to become one of the great ceramic industry centers of the United States; while in 1842 William Bromley of Stoke-on-Trent, England, opened a pottery in Cincinnati, Ohio; and about ten years later, the potteries in Trenton, New Jersey, presently known as "the Staffordshire of America", had their beginning.

Mention should also be made of that early American ancestor of the ceramic sculptors that are now legion: no less a personage than John Rogers of New York, whose terra cotta **"Rogers Groups"** were deservedly all the rage in the sixties and seventies as perfect examples of concentration upon the prevailing mid-Victorian "American Scene". And now it can be told that well-known sculptors, including men of the calibre of Daniel Chester French, were actually employed to model some of the figures.

Despite the impetus given to American ceramics by the Centennial Exposition in Philadelphia in 1876, when, in competition with the products of all the countries of Europe, it was apparent that "America had been left behind in the race"; and despite the increased production of fine wares in the United States that followed such a rude awakening, it was not until 1918 that, under President Wilson, the White House for the first time purchased an American-made table service for the presidential table!

It was in the Lenox potteries, founded by Walter Scott Lenox, that the thin **Belleek china**, with its lustred, iridescent glaze, named for the famous product of the Belleek Porcelain Works in Ireland, was first made. Altho admittedly as perfect a fabrique as any found abroad, during the eighties and the "gay nineties" "this ware could not find a market, unless stamped with a foreign or misleading name!" Indeed so persistent was the senseless worship of imports thruout the country that perforce only the inexpensive domestic wares were readily marketable.

A direct outcome of the Centennial of 1876 was the founding of the well-known Rookwood Pottery in Cincinnati in 1880, at the instigation of Mrs. Maria Longworth Nichols. It was also in Cincinnati during this same period that a group of women, under the leadership of Miss M. Louise McLaughlin, undertook underglaze painting for the first time in the United States, and also experimented with considerable success in making single-fired porcelain.

The state of Ohio has always played a leading part in the history of American potting; for it was in 1894 (two years after the founding of the New York Ceramic Society) that Edward Orton, Jr. succeeded in the establishment of the "first ceramic school for the scientific study of ceramic engineering" at Ohio State University in Columbus —a school ably carried on today by the outstanding ceramist, Arthur F. Baggs, and his associates. Orton is also honored as the founder of the American Ceramic Society, "organized to promote the art, science and technology of ceramics", likewise with its headquarters in the city of Columbus. Furthermore, it is the great Cleveland Museum of Art which, under the directorship of William M. Milliken, has done so much to further the cause of ceramics and of the decorative arts in America.

The widely-known Cowan Pottery, specializing in ceramic sculpture and artistic wares, was operated in Rocky River, Ohio from 1913 to 1931 by R. Guy Cowan, who, with many personal awards and honors to his credit, was also for several years head of the Ceramic Department of the Cleveland School of Art. It was, in fact, under his leadership that the American school of ceramic sculpture

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

received its first real impetus and inspiration. As Guy Cowan has written: "Ceramic sculpture offers infinite possibilities in color, texture and character of material, with permanence above all other materials."

ADELAIDE ALSOP ROBINEAU (1865-1929), internationally-known ceramist, was the first in this country to make porcelains fired at the high temperatures maintained by the famous Chinese potters (at 2400° F.). Moreover, altho she had begun work as a china painter, in an era abounding in bric-a-brac of the most atrocious "arty" period in history, her designs and vase shapes included many specimens of such classic beauty that they rank with the greatest ceramic achievements of all time.

Adelaide Alsop Robineau had studied painting for a few weeks in a summer class taught by William M. Chase, and had exhibited water colors and miniatures at the National Academy of Design. Two weeks at the New York State College of Ceramics at Alfred University, however, to familiarize herself with the elementary processes of work in clay, comprised her only formal instruction in pottery-making; this under Dr. Charles Fergus Binns, the noted craftsman, writer and teacher, whose father had been Director of the Royal Worcester Porcelain Works in England.

But the real inspiration for her porcelain came from books. After her marriage to Samuel E. Robineau in 1899, Mrs. Robineau and her husband together undertook the publication of a magazine on china decoration, which was increasingly popular, with imports of white undecorated ware continually arriving in huge quantities from Limoges, France. Thus the *Keramic Studio* (now the magazine *Design*) was begun. From Taxile Doat at the Sevres Porcelain works there came a series of articles on the making of art porcelain fired at high temperatures (afterwards published in book form under the title of *Grand Feu Ceramics*—high fire ceramics), which were translated from the French by Mr. Robineau and printed in the new magazine. Thereupon Adelaide Robineau decided that she would make high fire porcelain, which, as Charles F. Binns has written, "involves the pursuit of the most intricate and hazardous enterprise in the field of creative activity: her success the more remarkable for to this complex task Mrs. Robineau brought no special technical equipment—her resources were a high ideal, an extremely delicate touch, indomitable perseverance and unlimited patience."

Adelaide Robineau began her pottery making in 1903, with the skilled assistance of her husband in the firing of a kiln which he had constructed for her. But in a studio workshop on a hill-top in Syracuse she was destined to produce masterpieces of craftsmanship that are collector's items today. Mrs. Robineau did not care for the *pâte sur pâte* process used by Taxile Doat of Sevres, with whom she was associated for a short time in an ill-starred porcelain-making venture in St. Louis, and, instead, used almost exclusively a difficult process of excised carving, in which, with a single sharp pointed tool, the background was cut away, and the design made to stand out in relief. Exceptional, besides her delicate carving, were her *flambé* glazes, by means of which she obtained *sang de boeuf*, the pure oxblood red of the Chinese and her craquelled and crystalline glazes. She inaugurated, and for the last ten years of her life was in charge of, the ceramic department of the College of Fine Arts at Syracuse University where she received the degree of Master of Ceramic Arts; and at the time of her death in 1929, at the height of her career and fame, she was preparing for a scheduled exhibition in London.

In 1911 a group of fifty-five Robineau porcelains was sent to the International Exposition at Turin, Italy, where the exhibit was awarded the Grand Prize, "the highest possible award". In 1912 her work was exhibited at the *Musée des Arts Décoratifs* and at the spring *Salon* in Paris, this leading to her election to membership in the *Society Internationale des Beaux Arts*. Besides other prizes and awards, her porcelains received the Grand Prize at the Panama-Pacific Exposition in 1915.

Her work is included in the permanent collections of the Metropolitan Museum, the Philadelphia Museum, the Detroit Art Institute, the Newark Museum, the Cranbrook Museum, the Newcomb College Museum and the Syracuse Museum, as well as in many private collections, including that of the late Taxile Doat of Sevres. After her death, a memorial exhibition of her work was organized by the Metropolitan Museum of Art, and afterwards circulated to other museums.

Said Royal Cortissoz, writing in the New York Herald Tribune about the International Exhibition of Ceramics at the Metropolitan Museum in 1928: "The potters of the United States hold their own as regards vitality and range, with one virtuoso at the head producing some extraordinary work. This leader

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

is Mrs. Adelaide Alsop Robineau of Syracuse — — Here are taste and technique magnificently fused. — — With a potter like Mrs. Robineau to the fore, it would seem as if almost anything were possible in the ceramic art of the country."

And from Taxile Doat in Sevres in 1929: "The Decorative Arts of the United States of America has suffered an immense loss with the death of Adelaide Robineau—its most remarkable and gifted leader."

THE NATIONAL CERAMIC EXHIBITION. *"American pottery and ceramic sculpture seem to me to be abreast of, if not superior to, anything that was being produced in Europe before the war."* (Gisela Richter, Curator of Roman and Greek Art, Metropolitan Museum of Art, New York, February, 1943.) Syracuse had long been known as a "pottery city". At about 1845 William H. Farrar, formerly associated with the United States Pottery at Bennington, Vermont, was making "Rockingham and Yellow Ware Pottery" in the town of Geddes, New York, now incorporated as part of the city of Syracuse: This upon the same site today occupied by the well-known Onondaga Pottery, which was founded in 1857 by James Pass of Burslem, England.

With this background, and, in particular, on account of its large collection of porcelains by Adelaide Alsop Robineau, who had lived and worked in Syracuse, the Syracuse Museum of Fine Arts in 1932 founded in her honor the National Ceramic Exhibition, at first known as the "Robineau Memorial": A non-commercial exhibition dedicated to the promotion of American ceramic art. And, besides pottery and ceramic sculpture, under a broad interpretation of the term "ceramic art", enamels on metal have been included. Ceramists from a mere eleven states responded to the invitation to participate in the first Ceramic National. Each year, however, the exhibition increased in scope and in importance until, in 1940, over one thousand entries had poured in from twenty-eight states, from Honolulu and from Canada; entries ranging all the way from decorative Indian jars from the pueblos of Santa Fe, or from the output of ambitious "unknowns" working in out-of-the-way mountain studios, to major ceramic works of heroic size by many of America's leading sculptors. But owing to the high standards maintained year after year by distinguished jurors, quality kept pace with quantity: with all works judged "on the basis of decorative, creative and technical qualities".

An essential feature of this exhibition has been its annual circuit, following the initial Syracuse showing, which has carried the ceramics to well-known museums and galleries thruout the United States and Canada, with the exhibition in such demand that there has always been a waiting list for bookings. Organized as an "open show", to which any ceramically-minded American might submit his work, this annual exhibition resulted in the discovery of new talent every year, with new names inevitably appearing from territory thru which the ceramics had been circuited during the previous season. Furthermore, prior to the last decade, ceramic sculpture, formerly classed under "crafts", was not admitted to national sculpture exhibitions; while today sculpture in a ceramic medium will be found on an equality with bronze and marble in every important sculpture show in the country.

In 1936 the Ceramic National received an invitation from the *Kunstindustrie (Art and Industry) Museum* in Copenhagen, Denmark: an invitation conveyed thru Ruth Bryan Owen, American Minister to Denmark. Thus it came about that in 1937 the first all-American exhibition of Contemporary Ceramics ever invited abroad by a foreign museum was circulated thruout Scandinavia, with bookings, after Copenhagen, at the *Röhsska Museum* in Gothenburg, Sweden, at the Swedish National Museum in Stockholm, and at the *Konsthall* in Helsinfors, Finland (the latter booking arranged with the cooperation of Miss Maija Grotell, Finnish-American ceramist)—ending with a special showing, also by invitation, at the Hanley Museum in Josiah Wedgwood's own town, Stoke-on-Trent, England! This entire ceramic venture was financed by the Rockefeller Foundation, and the exhibition, the work exclusively of living artists, was shown, upon its return from a veritable triumphant tour, at the Whitney Museum of American Art in New York City. Said Richard F. Bach of the Metropolitan Museum of Art, Chairman of the Jury, in the Foreword of the foreign catalog: "These national exhibitions have rendered signal service in consolidating American interest in ceramics, for they have furnished a concentration point for ability and effort in this field, thus providing a 'proving ground' where criteria of quality may be established."

International recognition came again in 1939, when the Seventh Ceramic National was invited by Dorothy Liebes, Director of the Decorative Arts Section of the Golden Gate Exposition, to represent ceramic art of

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

the United States at the San Francisco Fair. California, incidentally, has been second only to Ohio in its substantial representation in the Ceramic annuals, with Dr. Glen Lukens of the University of Southern California in the lead as craftsman and influential teacher, and with strong regional backing on the part of Reginald H. Poland, Director of the San Diego Gallery of Art, who has declared: "A National show such as this is interesting as an Index of American Civilization; in any case, a century hence it will be so considered."

The tenth anniversary of the Ceramic National was celebrated in the autumn of 1941 by an extensive exposition of Contemporary Ceramics of the Western Hemisphere, sponsored jointly by the Syracuse Museum and the International Business Machines Corporation: this exposition, the first of its kind, and the most extensive "all-American show" ever held, made possible thru the generosity and interest of Thomas J. Watson, Honorary Chairman of the National Ceramic Advisory Council. The Western Hemisphere show included work from eighteen countries, with Canadian pottery, assembled by the Canadian Potters' Guild, and South American pottery purchased especially for the exposition. The 1942 and 1943 Ceramic National annuals have been postponed on account of transportation conditions and other war-time difficulties.

Even before World War II, there was nothing in Europe that compared with the American ceramist's creative originality and the great variety evinced by a nation of individualists. For European potters, concentrating upon craftsmanship, had followed the same designs for years—sometimes for centuries—and, for the most part, were averse to innovations in forms or in technique. With contemporary European ceramics out of the picture, therefore, the American ceramist faces an increasingly important future. See *Three Books of the Potter's Art,* Piccolpasso, trans. by Bernard Rackham, 1934; *Pottery and Porcelain of the United States,* Edwin Atlee Barber, 1893; *The Story of the Potter,* Charles F. Binns, 1898; *The Craft of Athenian Pottery,* Gisela Richter, 1923; *Pottery and Porcelain,* Frederick Litchfield, 1925; *American Potters and Pottery,* John Ramsay, 1939; *Pottery: Its Craftsmanship and its Appreciation,* Edmund de Forest Curtis, 1940; *Pottery of the United States,* Helen E. Stiles, 1941; *United States Pottery, Encyclopedia Britannica,* Myrtle M. French. —A.W.O.

**Ceres.** See Demeter.

**ceresin wax.** Among the various waxes used for surface coatings on paintings, sculpture, and other objects of art, ceresin has had an occasional place. It is harder than paraffin and more white in its tone. It melts at a point above 65° C. and has a rather smooth and unctuous consistency. It is a mineral wax and a derivative of ozokerite. —G.L.S.

**cerography.** A method of painting which uses wax as a binder. The wax is heated with hot irons to make the colors fluid and to fix them.

**certificate of authenticity.** See FORGERIES IN PAINTING.

**cerulean blue.** As a bright, faintly greenish blue pigment, this synthetically prepared material has been available to painters since about 1860, though the process of making it was known before that. It is made by precipitating together cobaltous chloride and potassium stannite, the result being a combination of the salts of the metals, cobalt and tin. It is a fine-grained, stable, and inert pigment. —G.L.S.

**cestrum.** Like the cauterium, the cestrum was an ancient tool of the painter and probably of other workers in the arts. It is mentioned by Pliny (XXXV, 149) and from its description appears to have been a pointed instrument used with wax. —G.L.S.

**Ceylon, art of.** See INDIAN ART.

**Chabad Chassidim.** See JEWISH MUSIC.

**Chaco Canyon.** A canyon in northwestern New Mexico, about 10 miles long and 1 mile wide, in which were concentrated some of the most imposing open villages of the Great Pueblo Age. More than 15 major sites and a great many minor ones have been located. Pueblo Bonito (Beautiful Village) was one of the largest, with nearly 1000 rooms arranged on a roughly semicircular plan, and apparently one of the wealthiest, judging from its size, the large number of its kivas, and the rich turquoise ornaments and pottery found there. Chetro Ketl (Rain Village) nearby was roughly E-shape. The origin, history and fate of the inhabitants of the valley are unknown. Dates have been determined by tree ring dating. The site is now the Chaco Canyon National Monument. See Pueblo art. —H.G.

**chaconne.** An ancient Spanish dance of possible Moorish origin, the *chaconne* or *cicona* is included among the *pre-classic* dance forms

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

by virtue of its great contribution to classic music. Little is known about the original dance except that it was solemn in mood and performed in slow 3/4 meter, usually as a solo. It eventually appeared in 18th cent. society and French court as the final dance of a ball. This court form was carried over, with many variations, into musical composition. The chaconne, as danced by the nobility, consisted of one basic figure danced by the entire group in alternation with changing figures by various couples or smaller groups. In music, this pattern was developed into the *rondo, theme and variations,* and *air on a ground bass.* The latter musical form is also thought to have stemmed from another dance similar to the chaconne — the *passacaglia.* Whether the above arrangement characterized the ancient *cicona,* or was introduced by the French, is not clear. See passacaglia. —J.G.

**chain lines.** See wire-marks.

**chaire** (Jap.). A tea-caddy especially made for the powdered tea used in *cha-no-yu* (q.v.).

**chaitya** (Skr.). See caitya.

**chakin** (Jap.). An oblong piece of white linen used for wiping the tea-bowl during *cha-no-yu* (q.v.).

**Chalcidian ware.** See Ionian vases.

**chalk.** Common now as an ingredient in the grounds for paintings, this had a wide use, particularly in northern Europe, when panel paintings coated with white gesso were general. It is still a regular ingredient in certain oil grounds where it is mixed with white lead, linseed oil, and other materials.—G.L.S.

**chalumeau.** See MUSICAL INSTRUMENTS.

**chamber.** A space inclosed by walls and ceiling; a room.

**chamber music.** May be defined as music of an intimate character scored for solo instruments (one instrument to each part). Its proper place is in the salon in contrast to the symphony orchestra in the large concert auditorium or the opera company in a spacious theatre. Thus its identity depends on an intimate scale of performance. The forms employed were those usual at each period.

Chamber music emerges in a somewhat shadowy fashion from the other instrumental genres of the 15th and 16th cents. The two great climax periods coincide roughly with the lives of Bach and Handel and with the period of Haydn, Mozart, and Beethoven. The atmosphere of the Romantic period was less favorable to the development of chamber music than to the production of works for solo piano and for symphony orchestra. The rise of great permanent concert orchestras with the accompanying delight in color possibilities, the decline of the race of wealthy and cultured patrons of chamber music, the rise of the heaven-storming individualists (the virtuoso pianist and the professional conductor), all contributed to focus the attention of composer and public elsewhere. That significant and charming chamber music works were nevertheless composed during the Romantic period, and since that time, is true indeed. It is, however, significant that among the most successful composers of chamber music during the Romantic period and later were those who had the closest sympathy for classic music. Brahms is perhaps the best example.

The growth of a wider public for chamber music which is no longer limited to a privileged and cultured circle is a cheering development. This new audience is small when compared to the audiences for the symphony concert or the opera, but its existence suggests further possibilities for a form of musical art which has always been the delight of composers. To this result the broadcasts of chamber music, which still remain too infrequent, have contributed much.

Early chamber music developed in the courts of Europe, in the palaces and manor houses of cultured noblemen. It was performed by professional musicians attached to the court circle or belonging to the retinue of an individual patron. These performers were joined on less formal occasions by music-loving amateurs. During the 17th cent. amateur performances on the viols were an important part of English domestic music. University circles in Germany formed performing groups which were often headed by famous musicians.

Renaissance taste favored music performed on families of instruments the sizes of which corresponded in a rough fashion to the compass of the various voices. Thus the *Canzoni* of Florenzio Maschera (Brescia, 1584) though it contains instrumental forms, both dance-tunes and movements in imitation, nevertheless is written in a thoroughly vocal style. The English term for such a group was **consort.** Even at this time, however, stringed instruments (lutes and viols) were preferred for domestic music. The rarer case where unlike

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

instruments played together was the **broken consort.** A fine early example of music for broken consort is the Morley *Consort Lessons* of 1599 which is scored for treble viol, recorder, and bass viol supported by a group of plucked instruments (lute, pandora, and cittern).

Music played during the 16th and 17th cents. may be divided into dance-airs which were gradually grouped in a contrasting series, the suite. On the other hand, an important group of forms was based on a polyphonic ideal and consisted in an adaptation of the basic principles of the vocal motet. Such forms were the ricercare, the canzona, and (esp. in England) the fancy or fantasia.

Much instrumental chamber music of early date was scored for five or six parts, as were many madrigals of the same period. The typical group for the period of Bach and Handel, however, was a trio consisting of two instruments of soprano compass (violins, oboes, or flutes) with a bass instrument (viola da gamba, cello, or bassoon). Furnishing a discreet harmonic background was a keyboard instrument or a lute. The melodic instruments were thus free to elaborate their melodic designs, relatively unhampered by the necessity of forming sonorous chords since the accompanying instruments could be depended on to fill in and unify the ensemble. This ideal which is completely foreign to modern conceptions of chamber style was dominant up to the classic period and even left perceptible traces on the music of that period. The **trio sonata** might be a **chamber sonata** (*sonata da camera*) in which case the music consisted of a series of contrasting dances; or it might be a **church sonata** (*sonata da chiesa*) in which case the principle of alternating lyric and animated movements was followed, with music more abstract and contrapuntal in style. In this connection the name of Arcangelo Corelli must be added to those of Bach and Handel. His first four works consist of trio sonatas which are models of elegance and perfection of style.

Chamber music of the classic period, the period of Haydn, Mozart, and Beethoven, was characterized by the dominance of a single form, the sonata form, and by two chief mediums, unaccompanied strings and stringed instruments with piano. To these must be added chamber music for wood-wind instruments, relatively important at the time of Mozart but diminishing in importance towards the present.

The chief medium for stringed istruments, indeed the most important chamber music combination, is the **string quartet:** two violins, viola, and cello. Subtract one violin, and a **string trio** remains. Add a second viola or cello, and the group is a **string quintet.** Larger ensembles are less frequent. The double quartets of Spohr are no longer played, but the Mendelssohn *Octet* remains a brilliant treatment of a most attractive combination.

The piano does not associate on equal terms with the stringed instruments. They constitute, rather, two opposing groups, the piano balancing and in more recent works often more than balancing the combined forces of the strings. The usual groupings are **piano trio:** piano, violin, and cello; **piano quartet:** piano, violin, viola, and cello; and **piano quintet:** piano with string quartet. The piano in these combinations is not merely a background instrument as in the preceding period but is an integral part of the musical texture, stating themes and developing accessory designs as well as accompanying the stringed instruments. Modern composers for the most part still compose for these combinations.

Romantic and modern chamber music is hardly distinguished by novelty of medium or form so much as by a new spirit. One may instance the Stravinsky *Octet for Wind Instruments* as novel in instrumentation or the *Varèse Octandre* as free from the influence of sonata form. In general, however, composers have remained faithful to the conventional combinations of instruments and, while treating the sonata form with freedom, have accepted its broad outline. It has, however, been difficult to keep a just balance of style at a time which is accustomed to the broad sonorities and kaleidoscopic color of the modern symphony orchestra. The limited color possibilities of the stringed instruments have been exploited in the most minute fashion. Orchestral traits like the bow tremolo have appeared and have not always been handled with suitable restraint. Such a blurring of stylistic lines is perhaps inevitable at a time which is orchestra-dominated.

At the same time professional chamber music has almost completely lost its domestic character and has become concert music for the small hall. Only enthusiastic amateur groups pursue the art of chamber music in what is perhaps the most ideal fashion. Thus a void appears separating modern chamber music, subtly colored, technically exacting, and molded to the requirements of concert performers, and the musical needs of the

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

amateur quartet party. Such groups in view of their technical limitations and the lack of time available for rehearsal are likely to find that the best point of compromise may be found in a Haydn quartet or in a quartet from the *Opus 18* of Beethoven.

Meanwhile a mass audience for chamber music is perhaps in the making as a result of chamber music broadcasts. Here is the possibility of listening in informal surroundings to music small in scale, appealing to, rather than overwhelming, our musical sensibilities, yet music which can be transmitted to thousands of listeners without fading out in the depths of some huge auditorium and without losing its essential character.

In closing one should point out that certain vocal forms may properly be regarded as chamber music, not only the madrigal of the 16th and early 17th cents., but the later chamber duet for two voices with an instrumental bass part. Classic examples in the latter form have been left by Agostino Steffani, Carlo Maria Clari, and Handel. The interest in opera and in the large chorus have tended to remove vocal music from the sphere of chamber music. Nevertheless, such recent works as Hindemith's *Eight canons for two voices with instruments* (Op. 45, No. 2) represent an attempt to return to the chamber music ideal. —C.W.H.

**champlevé enamel.** A particular technique in enamel work generally applied to a copper background. In enamels of this kind the background not occupied by the design is hollowed out and the empty spaces are then filled with the vitreous paste; a mode of procedure entirely different to cloisonné enamel (q.v.). Champlevé enamel was employed in many outstanding goldsmiths' works of German origin during the Middle Ages. It is believed that it spread from there to France in the 12th cent., when Abbot Suger of St. Denis invited Lotharingian enamellers to his monastery to complete works of this kind. Later it was highly developed in the work shops of Limoges from where it spread all over Europe. In the beginning, champlevé enamel served solely ecclesiastical purposes and was applied to crosses, portable altars, chalices, etc. Still later it was used as decoration on mundane objects such as hat ornaments, clasps, coats of arms. See ENAMELLING ON METAL. —L.L.

**chancel.** That part of a church east of the nave, including the choir and sanctuary, and reserved for the clergy.

**chancery** (script). See writing.

**chang** (Ch.). Ritualistic jade sometimes called a "half-tablet"; it is in the form of half a *kuei* (q.v.), if divided vertically.

**changeable flats.** See STAGESETTING.

**cha-no-yu** (Jap.). The serving of powdered tea in a formal, ceremonial-like manner. The utensils used are as follows:

| | |
|---|---|
| *chaire* | *hibachi* |
| *chakin* | *hibashi* |
| *chasen* | *hishaku* |
| *chashaku* | *kama* |
| *chawan* | *kamashiki* |
| *fukusa* | *kan* |
| *furo* | *kōbako* |
| *futa-oki* | *koboshi* |
| *habōki* | *kōg* |
| *haisaji* | *ō* |

**chanson, chanson balladée, chanson de geste, chansonnier.** See MEDIEVAL MUSIC.

**chant, unrhythmical and rhythmical.** See JEWISH MUSIC.

**chapbook.** *Book.* A small book in a paper binding sold by hawkers in the 17th and 18th cents., usually containing tales, bawdy ballads, lives of criminals, tracts, etc. —H.E.S.

**chapter house.** See monastic architecture.

**character dance.** Dances of *characterization* are those whose movements take on the qualities of another character. The creative imagination appropriates the experiences of another and enters into a point of view different from his own. The dancer "others" himself. He designs his movements to portray another's actions and feelings. Animals as well as people suggest a wealth of subject matter for characterization. See H'Doubler, M. N., *Dance, A Creative Art Experience,* 1940. —M.N.H.'D.

**characteristic note, tone.** See leading tone s.v. scale.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

**charcoal.** The carbon made from roasting pieces of wood in a closed vessel has been a drawing and coloring material from prehistoric times. As thin sticks, made from close-grained wood like willow or beech, it is a regular drawing instrument. Pulverized, charcoal provides a common black pigment. —G.L.S.

**chardonnet silk.** Named after its inventor, Count Hilaire de Chardonnet, a Frenchman, who first invented the nitrocellulose process in 1884. Syn. for nitrocellulose rayon. Now obs. in the U. S. —G.W.R.

**charges.** See HERALDRY.

**charter** (script). See writing.

**chaseki** (Jap.). See chashitsu; JAPANESE ART.

**chasen** (Jap.). A whisk of split bamboo used to whip each serving of powdered tea in the tea-bowl during *cha-no-yu* (q.v.). See JAPANESE ART.

**chashaku** (Jap.). A bamboo or ivory spoon used to transfer powdered tea from the caddy to the tea-bowl during *cha-no-yu* (q.v.).

**chasse.** See reliquary.

**Chassidim.** See JEWISH MUSIC.

**châssis.** *Painting.* A frame on which canvas may be stretched. *Sculp.* Modeling stand with revolving top on which wax model or armature (q.v.) may be placed.

**chatta.** See stupa.

**chatty** (Hind.). An earthen pot for holding liquids.

**chawan** (Jap.). The tea-bowl, invariably of pottery, used in *cha-no-yu* (q.v.).

**chazan.** See JEWISH MUSIC.

**checkerboard.** A decorative pattern which divides a surface into equal squares treated alternately in different ways, as with different colors or inset patterns or with high and low relief.

**chef-d'oeuvre** (Fr.). A masterpiece.

**Chellean art.** See PREHISTORIC ART.

**Chelsea ware.** See CERAMICS II.

**chemical porcelain.** Highly fired, resists rapid temperature change and reaction of chemicals. See CERAMICS I.

**cheng.** (Ch.). Banner paintings.

**chenille** (Fr. caterpillar). It is so named because its surface is composed of rows of fuzzy, V-shaped cord or fur, cut in strips from a blanket woven on the weft loom. These strips are attached, by means of strong linen or cotton catcher threads, to the coarse wool backing of the rug as it is being woven on the second or chenille loom. Chenille is woven up to thirty feet wide without a seam on a power loom. —B.E.J.

**chenille Axminster.** See carpet structures.

**chest.** See FURNITURE.

**chevet** (Fr.). Apsidal end of a church; esp. the entire east end of a church including the semicircular or polygonal vault over the end of the choir, the ambulatory, and the absidioles.

**chevron.** See HERALDRY.

**chi** (Ch.). Chinese word for lacquer ware. See SYMBOLISM IN FAR EASTERN ART.

**ch'i** (Ch.). Ritualistic jade axe. See also CHINESE ARTS s.v. calligraphy.

**chia** (Ch.). A sacrificial bronze vessel, three or four-legged, with handle at side, and two stanchions on top of lip as ornamented guides for cover. —J.A.M.

**chiaroscuro.** Meaning light and dark, a sister word to pianoforte, meaning soft and loud; was a term having to do with woodcuts. The finished picture displays a pleasant tone of contrasting lights and shades. Since the days of Leonardo da Vinci the term refers to the way the painter handles those atmospheric effects which permit him to create the illusion that his subjects are on all sides surrounded by space, letting them stand "free." See COLOR; PERSPECTIVE; PRINTS AND PRINT PROCESSES.

**Chicago school.** See functional architecture.

**Chichimeca.** Generic name given to the wild tribes which entered the Valley of Mexico around the 11th century. In this period there were a number of independent tribal groups which later took over the traits of Aztec civilization. —G.C.V.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

**chidori** (Jap.). Small birds (plover). Often associated with waves, a common wave and bird pattern.

**chief.** See HERALDRY.

**Chien yao** (Ch.). Chinese pottery ware of the *Sung* dynasty. Thick glaze, iridescent purplish, bluish black or brown.

**chiffon** (1) Descriptive term indicating light weight and soft finish, as chiffon velvet or chiffon taffeta. (2) Light weight silk hose, 2-4 thread yarns. (3) Gauzelike silk fabric with soft or sometimes stiff finish. Warp and filling of hard twist singles. —G.W.R.

**chigaidana** (Jap.). Shelves and sometimes cupboards, adjacent to the *tokonoma* (or place of honor) on which *objets d'art* are shown. —J.A.M.

**Chigi vase.** See HELLENIC ART.

**chih** (Ch.). Sacrificial bronze vessel. Vaselike jar with cover and a base, for sacrificial wine; also the Chinese word for paper.

**chih hua** (Ch.). A style of Chinese pictorial painting made by dipping the finger or fingernail into color and producing a picture without the aid of a brush. —J.A.M.

**CHILDREN'S ART.** *General.* Children's art can be defined as a visual means of expressing their mental attitudes. The mode of expression as well as the subject through which children express their approach to and position in the world is characteristic and unique. Once the mental attitude of childhood is outgrown and is changing into that of adulthood, whether at the age of nine or seventeen, art also is no more that of a child.

Since children's art is a means of expressing—visually—experiences, problems or simply observations, its development can be compared to language. Children's art, esp. children's drawings, fulfill a dual role. (a) They are a means of communication. Since the smaller child can draw more swiftly than he can write and has a picture vocabulary which is larger and more vivid than his abstract word vocabulary, he is in a better position to express himself through pictures than words, a situation which holds true for the average child until he is seven to nine years old. (b) Children's art provides them with an emotional outlet and an aesthetic satisfaction. Emotions find various ways of expression through lines, peculiar proportions or color, all of them carrying a symbolic meaning The act of drawing or any other way of picturing is in itself a means of indirectly re-living, re-enacting or simply completing experiences to which otherwise the child could not react fully. Thus, at the ages eight to eleven children who ordinarily would not sit still for any length of time, but would seek satisfaction in long periods of violent play exercises, substitute these purely physical activities by representing them in pictures. They experience these activities indirectly and derive in most cases an even greater satisfaction, since in their own representation they can be as successful as they wish to be and since, in the depicted play drama, unlike to real life, they are in a position to assign diverse parts to the people whose participation they desire.

*History.* Ever since children's art has attracted attention to the point of being studied methodically, i.e., since the eighties of the last century, it has been interpreted very differently. Its aesthetic qualities went first unnoticed because unrecognized. Attention was directed to the symbolism of its mode of expression and interpretation of it was undertaken in the light of children's personal growth and enrichment of observations.

Later an interpretation of child development in terms of their mode of representation was undertaken and children's drawings were studied on a larger scale in order to generalize and to find in their art generally applicable laws.

Still later, during the first years of the 20th cent., children's drawings were used as a proof for the assumption that each individual, in a more or less accurate way reenacts the development of mankind from the primitive cave dweller to the renaissance superman. This interpretation of child art was based on the similarity, and in some cases identity of drawings of small children and primitive tribes as well as the similarity of drawings of all children throughout the world regardless of the nationality or kind of culture they came from.

After World War I children's art served as a simplified example of explaining art theory problems and as a special phase of expressionism. In fact, the attention paid quite generally to child art since the early twenties is largely due to the expressionist art movement. At present, predominantly in the U. S. A., research in children's art serves the purpose of establishing and clarifying the facts and factors connected with it and their relation to child development. Hence, investigations have become less general and philo-

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

sophical and more specific and fact finding, thus more adaptable to educational objectives.

*Developmental Stages in Children's Art.* The function of and the qualities inherent in child art are extremely complex. It is not possible to separate and single out characteristics without distorting the pattern of their occurrence and interrelation. Although it is necessary to separate characteristics such as color, line or proportion in a drawing in order to acquire a more complete knowledge and to analyze in turn the qualities contained in each characteristic, one must keep in mind that there exists a functional relationship without which the analysis and interpretation of separate items is invalid. Children's art is a phase of their general development.

(a) *Subjects represented in Children's Art.* Younger children—4/5 to 9/10 years old—choose episodes of their own lives, activities in which they take part, such as outdoor plays, gardening, cooking, a party or picnic; places they see and can observe closely, such as their own house and garden, the park, the streets or the place where they spent their vacation; objects in which they are particularly interested, such as airplanes or automobiles. The content of their pictures is often characterized by changing some part of the reality they depict and fashioning it to suit their wishful thinking or express their admiration. The objects drawn in the pictures are various. People, i.e., men and women make up the largest percentage. This preference decreases as they grow older but comes back later, at the age of thirteen or so; i.e., during the transitional stage to adult observation and criticism. At this time their art takes the form of stereotypes of "pretty" girls and "strong" men. Animals, houses, trees and flowers, furniture pieces, eating utensils, toys and wagons are other objects of the young children's picture world.

(b) *Mode of representation.* It changes in both their drawings and their modeling according to age level. One can distinguish five developmental stages. The change from one to the next is gradual. Few drawings are entirely representative of one single stage, nor does all the art work of a given child have the characteristics of one phase only. The developmental phases of child art are irreversible. Though children will experience all or some of the stages, they do not go through a later one without having gone through the earlier ones, even if a given developmental stage sometimes lasts such a short time — as happens occasionally with artists — as to be non-apparent.

1. The first stage, the scribble stage, is characteristic of children between three and six. During it objects or ideas are expressed by means of scribbling which, though meaningless to others, has a significance to the scribbling child and can be revealed by him during the making of the scribble picture.

2. The second stage, the schematic stage, is characterized by a pictorial representation in which use is made of simplified symbols, the shapes and contours of which bear a rough, diagrammatic resemblance to the real objects. Thus, each part of an object is outlined in the shape of rounds, ovals, near-squares, dots and straight lines and each part is finished before being joined to the next until all parts are assembled. The process of assembling is additive. Parts or details are often more important than the whole. One could say that the whole consists only of those parts that are essential at a given moment and hence the whole changes according to the changing importance of parts. Thus a human figure may be represented with one arm only, though with a multitude of details related to this one arm, while the other arm is omitted, because in the picture situation no function is assigned to the other arm. Another characteristic of the schema is the omission of a single point of vantage from which the picture is seen as is customary in all occidental pictorial representation. In the child's schematic picture, the point of vantage changes so that some objects are depicted as if seen simultaneously from all or several sides, from the top or from underneath. Each schematic picture object is worked out step by step. Though schemata differ somewhat among children, the schematic child's drawings have enough characteristics in common to give them the appearance of a style of their own and to set them apart from other schematic art forms.

3. The third developmental stage, the mixed or intermediate stage, is reached when children's schemata become intermixed with the characteristics of the fourth developmental stage: art true-to-appearance. Some objects will be partly schematic and partly true-to-appearance. Picture compositions may contain wholly schematic objects and also objects which are definitely true-to-appearance.

4. For the fourth developmental stage, representation true-to-appearance, it is characteristic that an attempt is made to represent

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

objects as they appear to an observer from a single point of vantage. Since depth is as yet not represented, the objects give an impression of flatness. Contrary to the schematic pictures, hidden parts of objects or whole objects are not represented because they cannot be seen.

5. The fifth stage, that of representation in space, is reached when depth, perspective or modeling in the round is added to the flatness of the contours used in true-to-appearance representation. One can distinguish between linear representation—convergence of lines, retaining of the verticals, eye-line; modeling of objects by means of shading and foreshortening; and color perspective, i.e., change of color to indicate distance such as faded colors in the background in contrast to the brilliancy of the foreground colors.

The developmental stages following the schematic stage are transitional stages to adult visual representation. The only stage truly representative of childhood is the schematic stage.

The primitive schema is interesting mainly for its psychological and developmental implications. It often represents nothing more than the human head from which hang down directly the legs, omitting the body entirely. In the course of perfecting the schema all parts of the human figure are included. First it is represented frontwise: the head as a near-round in which the eyes are dots or filled-in circles placed under and close to the top outlines of the head, the nose is a perpendicular single or double line in between and the mouth is a couple of horizontal lines with cross lines for teeth; the body as a near-oval with a row of buttons or a neckline or waistline to indicate a suit or dress; the legs as outlines of tubes hanging down from the oval body to which shorter tubes are fastened at a right angle, giving the impression of a pair of hockey sticks; arms resemble the legs and hang from the upper sides of the body ending in a leaflike hand. The frontview is gradually changed into a side view and both views are used in schematic pictures. However, the eye in the fully developed profile view remains frontwise, thus giving the head an appearance similar to certain Egyptian drawings; the outlines of the body, legs and arms remain the same, but are given a direction to either left or right. Both front and profile views are represented in rigid standing positions. Sitting or bending figures are exceptional. Sex is differentiated by given attributes.

The schematic animal, a horizontally laid out human schema, is usually represented in profile. In the course of developing the animal schema, particular attributes of mammal, bird or fish are worked out and at the height of the schema individual differences permit a differentiation of individual kinds such as the long flat bill of the duck as compared to the short pointed beak of the chicken.

In tree schemata a substantial double line is drawn for the trunk, representing a vertical axis, from which straight horizontal lines spread as branches from which in turn, again vertically and horizontally, shorter lines spread out, the twigs. From the latter hang leaves, blossoms and fruit, individually outlined, identical in shape, so arranged as not to interfere with each other. Besides this schema there is the near-circular shape, such as for the maple tree, the flame-shaped outline, such as for the poplar and the triangular schema, such as for the spruce tree. There are three distinct flower schemata with appropriate variations: the button type, a round with a dot in the center; the composite or daisy type, a circle of narrow cones or loops; and the tulip type, a drooping or upwardly directed bell shape. Single or double lines, slightly curved, represent the stem to which is added a narrow-shaped leaf-outline on one or both sides of it.

The house, a favorite of the child's picture world is shown with one to three or even four sides, unfolded side by side. A triangular roof is fitted exactly to the top. Windows are set in, shaped as small rectangles and at irregular distances. The door is always represented with a handle or knob. The chimney, out of which curls a black cloud of scribbled smoke is set perpendicular unto one side of the roof.

Characteristic of child drawing, and thus differing from populistic painting, is the lack of proportion among parts of a given object and among several objects. Thus the head of the human figure is very large as compared to the rest of the body; leaves of trees or fruit are gigantic in size as compared to the whole tree; flowers may have the size of the house along which they grow and people going to church may be as tall as the church itself. It has been shown experimentally that the child's estimate of proportion of real objects is as correct as that of adults. Since drawing fulfills the purpose of expressing a thought or describing an experience, the importance of certain parts of the experience is underlined by an exaggeration of size. Also,

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

if an object has a number of important details, these details must be crowded in and, logically, the object becomes disproportioned. Furthermore, exaggeration of size symbolizes an action or the wish to attain a goal which is out of reach. Thus, one arm may have twice the size of the other, in order to indicate the necessity to reach or pull an object—and to represent strength. Conversely, uninteresting parts or details are shrunk or omitted.

Movement of objects in the schematic picture is not shown by bending of joints. It is achieved by zigzagging or curly lines and translates the child's experience of muscular sensations, not the appearance of movement to an onlooker. The shape of the object remains static, the lines have movement.

Another important characteristic of the child's schema is his desire to represent all that which is connected with his experience, whether simultaneously visible or not. Hence the transparency of certain objects such as a house or people's clothing or the picturing of objects hidden by a wall or fence.

(c) *Organization and Orientation.* The organization and orientation of pictures is also closely linked to general child development. The pre-school child scatters the objects of his representation over the paper. He does not distinguish between up and down, right or left and turns his paper during the process of drawing so that some parts seem upside down in comparison to others. Also, during this developmental phase, there are gaps between picture elements which are supplemented by oral narrative. As orientation proceeds, dislocation within a unit disappears and, in time, units are properly related to each other. Simultaneously, the graphic organization of the picture progresses toward an all-graphic unified composition. The desire of expressing some definite experience through the content is satisfied by either breaking up the representation into a series or by a repeated representation of some individuals or objects within the same picture in order to indicate various activities or situations. Whereas in the early stage of schematic organization few and single objects were placed far enough apart that they would not interfere with one another, the fully developed schematic organization represents crowds or masses of objects. To do so, single schemata are repeated identically in a multiple arrangement, a conclusion arrived at through reasoning, e.g., that a forest consists of very many trees and hence in order to represent a forest, rows upon rows of identical trees must be pictured.

In a schematic picture spatial arrangements are not interpreted through perspective of some kind but through organization. Though perspective is recognized and correctly interpreted in photographs or in perspective paintings, the child's way of expressing distance or depth is closer to oriental than occidental interpretation of space. In the average schematic picture figures or objects are arranged on a standline representing the ground—the earth—which includes objects in front and objects farther back. Above them is left an empty space—the air. Toward the top of the page a strip of blue indicates the sky and a yellow disk the sun. In order to express more intricate spatial arrangements the schematic child places several bands or standlines on top of each other and thus indicates by the bottom standline nearness, and by the top line farness. There are no differentiations of size. Another means of spatial arrangement is the maplike bird's-eye view of a given space, dotted with schemata of the objects involved.

Schematic drawings and modelings are made from memory. Even when supposed to draw from a model, children will look at it for the purpose of finding out what they are supposed to draw; they will observe details; and then they will start to draw by memory the object represented by the model but not the particular model in front of them. Memory is by no means purely pictorial. It is sense-mixed, i.e., a combination of remembered sensations of touch, hearing, taste or of a kinesthetic nature—all of which is interspersed by abstract concepts. The child necessarily evolves a memory stereotype which represents an abstraction. This abstraction, a symbol, is the schema and is being developed during a number of repetitions until it becomes as automatic as handwriting.

*Painting and Color Use.* Schematic child art uses color liberally. (1) Color is used during the scribble stage and in the primitive schema for manipulative purposes, i.e., to learn about color and for the pleasure of using it whether or not the color fits the pictured object. (2) It is characteristic of the schema that the color must be "true", i.e., that it must match the actual color of the object. If the local color of a tree trunk is brown and that of grass light green and that of the sky blue, then the colors applied in the picture must match accordingly. Even so, a large number of objects are observed for their shape and are of a nondescript color, in which cases color is either avoided or applied arbitrarily. The concept of "true" color is the reason for

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

coloring distant hills in a bright color, thus matching the color the trees on the hill are known to have. Further development of the color schema leads to a modification of colors, i.e., to a variety of shades of a given color in order to match more closely the actual color of the object. Color remains independent of light effects or transparency all through the schematic stage, hence color as the most important mode of expression of the painter, e.g. impressionist painters, is foreign to child art. Its use may be likened to illumination in the Middle Ages. Though it is essential, it is subordinated to shape. (3) Color is used as a medium for emotional expression. In order to underline the importance of an object or of one of its parts a particular color is applied; or in order to symbolize taste, smell or sound certain "unreal" colors are used or one color is used exclusively. Peculiar coloring in some children's pictures may be indications of maladjustment, similar to the peculiar coloring used by certain types of insanes.

*Technique and Media.* (a) GENERAL. Left to themselves, children try a variety of media. The technique which they use is principally the same and is prescribed and limited by the nature of the schematic drawing as well as by the mental process which leads to its execution. Since all objects or portions of objects are outlined and set off against their surroundings, all drawings are ultimately line drawings, colored within their outline. Hence the treatment of all media is subordinated, to a greater or lesser extent, to this key-technique. When schematic children apply color with large paint brushes they strive even then to make an outline first, after which they fill in the area. Thus any medium which calls for a technique which abolishes contour and defined areas is contrary to the nature of the child's schematic art and is more of an obstacle than an inducement to its development.

(b) DRAWING. Children's drawing is based on a line technique, whether coarse or fine, whether of single objects or of whole picture organizations. The technique is an outcome of the child's process of thought and visualization; it therefore crystallizes a mental attitude and consequently is fundamental.

(c) MODELING. The technique of children's modeling during the schematic stage corresponds to and parallels their drawing technique. Though far less data are available than for drawing, it seems evident that first attempts at modeling follow the flat contour schemata of their drawings. Figures and objects give the appearance of a flattened slab, to which details such as eyes, nose or mouth are added either as kneaded rolls or balls of clay or are indented with the fingers, thus outlining a depression. Another procedure in modeling is that of rolling balls and cylinders in order to shape the head, body, arms and legs. In both methods the additive process is followed, parallel to the process of drawing schemata in that parts are made indepently and then joined together. Similar to his drawings, the child represents the parts he knows as if taking a walk—mentally—around his object. Eventually he thus achieves an all-around modeled piece with details indicated in flat lines, very similar to gingerbread men.

(d) PAPER CUTTING. Children are successful silhouettists at an early age. The scissors take the place of pencil or crayon in tracing contours. Through folding, a number of identical, symmetrical objects can be produced. The objects which the child wishes to represent can be cut out in parts and in various colors. Then, following the additive process of the schema they can be glued on a sheet of paper in order to form a suitable picture arrangement. It is also an ideal medium to represent space schematically, since children can "put on" the dress on the figure they are picturing or stick the house in front of the mountain and the flowers in front of the house, thus satisfying their feeling for reality and finding an expression for nearness and farness. Younger children use papercuts as a prop for dramatization: paper figures can be moved and bent; they also can be finished in the back as well as in front regarding hair, dress and ornamentation, thus giving the illusion of completeness. Papercut pieces of this kind take the place of modelings; they do not collapse and they can be evolved like any other schematic representation. The facility with which very young children make papercuts and their successfulness has been explained by some art theorists (Germany) in the following way: that it may be caused by an unusually strong response of the subject to two-dimensional, i.e., flat shapes; that a large number of individual, isolated and rigid — unchangeable — impressions are accumulated which tend to strengthen distinct and detailed contours, a phenomenon markedly present in eidetic individuals. The fact that facility of cutting contours, i.e., of making silhouettes, exists in very young children who otherwise are still in the developmental phase of the primitive schema can be interpreted as supporting the claim that the majority of chil-

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

dren are eidetics who sooner or later, lose this quality.

(e) FINGERPAINTING. This is a medium especially fitted to the child's procedure of representation. The paints are tempera pigments to which starch is added as a binder. Opaque colors of this type can be superimposed on each other. The fingertips are used to apply the paint to wet paper. The technique is adapted to children's preference to work with their fingers directly. One of the main advantages of this medium is its therapeutic value. Also it has the advantage of making changing illustrations before a children's audience. Aesthetically, favor the child's inclination toward symmetry since both hands can be used simultaneously and in rhythmical movement. It permits painting of foreground over background so that the child can indulge in representing apparently hidden parts completely and subsequently cover them again. The handling of the paints, their mixture on the paper itself gives the illusion of modeling. The effects are often startling and create the illusion of expressionism.

(f) FASHIONING OF OBJECTS AND THEIR DECORATION. Very young children like to fashion objects. However, they have not yet attained the skill necessary to achieve results which would satisfy them. Similar to the scribble stage or the primitive schema, the fashioning of an object serves the purpose of creating something basically necessary for other activities. Later, children are more intent on decorating objects and fashion them for this purpose alone.

*Aesthetics of Children's Art.* (a) CHILDREN'S CONCEPT OF THE BEAUTIFUL is related to and dependent on their interests and activities, therefore on their participation, actually or mentally and on their sphere of interest. It changes according to age level and maturity. For younger children beauty is not static but associated with action or movement. Parades, bands, stage performances or dancing are beautiful. So are a number of things which can be enjoyed sensuously. An object is not beautiful because of its visual aspect alone. This is just a part of its beauty and not the most important. The enjoyment through other senses of sound, smell, touch or through kinesthesis are just as important or more so. The beauty of nature, too, is less a matter of visual enjoyment of scenery and its details, than of a background for real or imaginary activities, comparable to a stage-setting. Formal aspects, picturelike qualities of nature are not appreciated. Beauty of people or animals cannot be separated from moral concepts. What is good is beautiful and what is beautiful must be good. Besides these two distinct elements—participation and moral values—enjoyment of beauty is limited by the child's comprehension of units. He understands simple units such as a flower or a bird, and gradually progresses to more complex units and their appreciation.

The aesthetic element as a form element is grasped when sustained by a particularly interesting content and even so seldom in an articulate way. In other words, aesthetic factors enhance already interesting contents and are noticed only in this context.

(b) AESTHETIC ELEMENTS IN THE CHILD'S CREATIVE WORK. Since the child's painting, modeling or building are play activities, he acts through his pictures or similar creations and the activity aspect dominates aesthetic considerations. The early, purely sensuous enjoyment of handling colors or manipulating clay is subordinated later on to the content. Childhood is over when the effect of the child's creations on others or on himself is more important than the activity of producing them. The aesthetic factors of the schematic child's picture are mainly the following. (1) *Symmetry,* partly due to commencing a picture by drawing the main object in the center and distributing further objects around it; partly due to a sense of balance which may have its root in the symmetry of the body and symmetrical movements. (2) *Repetitional design elements* caused by the nature of schematic symbols. Since people, animals, trees, flowers, houses and other objects are represented by schemata which are repeated identically or near-identically the effect is pattern-like. The same element of repetitiousness is observed in the application of colors, again due to the fact that colors are applied according to their local trueness, therefore are coupled with like schemata and thus enhance the pattern effect. (3) *Brilliancy and color contrast.* They originate in the tendency to match the actual local color of objects e.g. blue of sky or water, green of grass or trees, with the colors applied in the picture and in the disregard of hues and tints as being unreal. Here must be mentioned certain "odd" colorings expressive of moods or sensations which bear a resemblance to certain characteristics of expressionism and have been interpreted as such. However, only a small number of schematic drawings of this kind gain aesthetically by these characteristics because of the haphazard way of application and there-

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

fore the failure of achieving a thematic unity. Older children, beyond the purely schematic stage are more successful aesthetically in expressing themselves in such manner. (4) *Compositional band arrangement.* It lends a formal effect. (5) *Decorativeness.* Although children do not strive to make decorative drawings they decorate the objects in their drawings, often very richly. Their intention is to represent a rich garment, or a house with elaborate windowframes. In decorating objects a similar attitude can be observed. The object's shape, proportion or curvature is of little importance. The main issue is the surface decoration. Decorations of any kind whether within a picture or on an actual object have usually some kind of narrative content. Few decorations are geometrical or abstract. They often represent a story within the story or a series of attributes related to the story. Thus it is not unusual to find that a child's schematic painting resembles a frieze in its arrangement and that the depicted objects are decorated in turn with figured bands or rows which in themselves constitute miniature friezes. The rigidity of objects and the resulting unreality contribute to the decorative effect.

(c) CHILDREN'S APPRECIATION OF VISUAL ART OBJECTS is less important and significant than their appreciation of other arts, esp. those involving any kind of activity. Only at the close of childhood does it rank first with children's interest in arts. The following facts can be stated as results from various investigations. (1) Children's picture—art—preferences vary according to age level and sex. (2) Their primary interest is the content of pictures or sculptures, even of patterns. (3) The interest of younger children centers on specific objects in the representation which seem to them the bearers of a real or imagined activity. They interpret the situation as actually existing and contemplate a picture as if looking on through a window. (4) Older children's interest in the content is less obvious and their associations are less crude. Their response is of a more emotional nature and tends to concentrate on character and morality. (5) Color interest ranges next to the interest in content and is therefore not primary. Color is interpreted emotionally, hence interpretations vary according to age level. Comparable to their own use of brilliant clear colors, younger children are partial to such colors in their art appreciation, while older children who are in the transitional stage are attracted by fewer assorted colors or by monochromes, similar to the use of color in their own paintings. (6) Younger children are indifferent to techniques and skill, older children notice them, esp. if the medium used in the art object is familiar to some one they have tried in their own art activity. (7) In terms of style and art period children prefer naturalism or realism — photographic likeness — to expressionism or decorative primitivism, or the non-perspective of oriental art.

Generally speaking, children's aesthetic response in art appreciation is indirect and usually unconscious; this is in contrast to their direct response to the non-aesthetic elements of an art object. Therefore, if the development of an aesthetic response seems desirable, aesthetic values must be represented by a content interesting to the age level in question.

*Children's Artistic Ability.* (a) TYPES OF ABILITY. Artistic ability is the ability of producing art objects or of understanding art that transcends that of the average child. One can discriminate between several types of ability. These may show separately or simultaneously. Artistic ability can be observed in varying degrees. One cannot state at exactly which point it has ceased to be average; it is more correct to conceive artistic ability quantitatively as a continuous quality scale on which some individuals rank very highly, others very close to average. Artistic ability correlates positively with higher intelligence. Among the types or kinds of ability one can observe are the ability of remembering and representing characteristics of an object at any time, an ability basic for the creative process in the visual arts; imaginative ability, i.e., the ability of the child to use visual concepts for representing his own phantasies, selecting certain elements and ignoring others; ability to draw from nature or model, i.e., the child's facility for a faithful reproduction of what he sees coupled with a limited amount of interpretation — an ability that appears during the transitional stage from schema to true-to-appearance; ability to copy exactly a given original, an ability which is usually found isolated from other artistic abilities and which is mostly observed in individuals with poor intelligence.

Children with artistic ability seldom represent one clearcut type of giftedness. Usually all types are present to a certain extent with one type predominating.

At the schematic stage the work of children of distinct ability resembles in some ways that of early European masters preceding the

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

era of perspective interpretation of nature and full modeling—13th cent. It also has a certain relationship to modern expressionistic art, perhaps due to the fact that gifted children have the ability to express with intensity an idea or experience. The gifted child's art products are the ones in which one can see resemblances to other art forms. Thus, some similarity can be noticed between the gifted child's schema and the symbolism of the art of primitive tribes; its decorativeness and non-perspective representation and certain types of oriental art; its sharpness of outline and stiffness of pose and populistic art.

There exist theories which try to explain the development of and excellence in a specific medium, such as modeling *vs.* drawing. It has been traced to a constitutional difference of response to the three-dimensional or to flat optical impressions. The type excelling in modeling has been called haptic and is characterized by a dominance of kinesthetic and empathic sensations. The type gifted for contours is represented by the silhouettist who retains contours automatically but whose mental image disintegrates when he is faced with the problem of representing the various parts outlined within the silhouetted shape. Ordinarily both types exist in the same individual. The gifted child can resolve the contradictory elements of both types in one medium.

(b) CHARACTERISTICS OF ARTISTIC ABILITY IN CHILDREN'S PRODUCTIVE WORK. Gifted children treat of a greater variety of subjects. They share this quality with non-gifted highly intellectual children of the primitive schematic phase and even up to the height of the schema. However, the non-gifted children of high intellect abandon visual means of expression very early in favor of some other means of expression, e.g. verbal. In choosing his subject the artistically outstanding child selects and develops themes which are essentially favorable to visual representation. There is no way of finding out experimentally why it happens, but one can assume that his selective procedure is his ability to separate the visual from the a-visual elements of his experiences. This power of selection is perhaps unconscious at first, but it is definitely conscious in the older child. The gifted child's range of schemata, i.e., his graphic vocabulary, is wider than that of the average child. His ability to remember visual characteristics enables him to represent objects with facility, to elaborate on them and to enrich them.

It has been observed at an early stage of study that gifted children reach each developmental stage earlier than average children; in fact, for a long time this has been considered the only reliable characteristic of special ability. While it is true that accelerated development is an important characteristic and while the question has been raised as to whether great artists ever pass through the schematic stage, it is also true that one cannot rely on this characteristic alone, since many children with a very accelerated development arrive at perspective representation but without any other symptoms of special artistic ability; hence the early attainment of the last developmental stage can be considered as precocity, but not as artistic ability. The speed of representational development of gifted children varies greatly. Some reach the height of schematic drawing at a time when the average child is still in his scribble stage, others can represent perspective and foreshortening at the age of eight. The acceleration in development may be interpreted by the gifted child's predominance of the visual. This predominance leads to a wider graphic vocabulary, to selection of visual characteristics and probably to discrimination of an aesthetic nature which in turn is responsible for the development of the outstanding aesthetic characteristics which accompany accelerated development where one encounters artistic ability.

A large number of children whose art work seems highly promising do not fulfil the promise when they outgrow the schematic stage. They regress in their aesthetic qualities and lose interest in their visual means of expression. Generally speaking, gifted children differ from average children who did outstandingly good art work during the schematic phase and failed to carry over into adolescence in that the gifted are able to re-acquire aesthetic qualities and to apply them consciously to an adult way of representation. The process may be likened to some kinds of modern primitivism or expressionism where the artist consciously develops this style of expression because he believes in it and not because he cannot learn any other technique. One of the characteristics carried over by gifted children is the ability to express movement. It is not only the result of an especially vivid memory. Other children, not especially gifted in the visual arts remember vividly too But while their memories are a combination of sense impressions and abstractions—a mixture which does not lend itself to clearcut visual expression—gifted children achieve a more complete integration of visual characteristics which, in the case of movement, leads to retainment of

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

essential characteristics though they may be exaggerated or distorted.

The gifted child has a greater desire and greater ability to learn. He is open to suggestions and eager to follow direct instruction; he will observe closely artists' work or his surroundings; he will not get discouraged and will try again and again. Contrary to the average child who eliminates objects from his representation because of gaps in his visual knowledge and who thus lowers his standard of production, the gifted child will strive to fill these gaps in order to keep or raise his artistic standard.

Picture organization, i.e., the grouping of a number of objects, is more highly developed in gifted children who carry over this ability to the next developmental stage; this is in contrast to average children who at that time avoid grouping of any kind.

Artistic ability can be noticed in the handling of a new medium. Most young children are eager to try a new medium. Older children are disinclined to do so unless encouraged or helped. Gifted children do not need special encouragement. Contrary to the average child who tries to adapt a new medium to a previously used familiar technique, the gifted child foregoes an acquired skill that is unsuitable for a new medium and tries to work out a new technique which will suit the new medium.

(c) ARTISTIC ABILITY AND ART APPRECIATION. The gifted child, like the average child (cf. Aesthetics of Children's Art above), is strongly influenced by the content of a work of art; i.e., he is guided by his own general interests. But, contrary to the average child, his range of interesting art objects is wider, and far less personal. Gifted children show interest in design and technique. They are not satisfied to admire the illusion that has been created through the work of art or with identifying themselves with the pictured situation as do average children. They undertake a kind of analysis for the purpose of understanding the means by which the artist creates the illusion or produces his effects. They endeavor to assimilate their findings for their own creative work. **chinchilla.** A thick, heavy woolen cloth for women's and children's coats, with a long napped surface rolled into little tufts, in imitation of chinchilla fur. —G.W.R.

**Chinese architecture.** See CHINESE ARTS.

**CHINESE ARTS.** *Painting.* The Chinese people always speak of painting and calligraphy together. They do so first because the two arts use the same materials (brush, ink, and silk or paper), are practiced by the same artists, and employ the same technique; and secondly because they follow the same aesthetic principles and require the same mental discipline, as we shall see. Very often the Chinese regard calligraphy as even a higher art than painting, because they consider it purer as a fine art and more spontaneous in production. It embodies the fundamental principles on which the art of painting is based.

(a) CALLIGRAPHY. Calligraphy to the Chinese is not merely good penmanship or an art of manuscript making. It is a fine art in the full sense of the word Fundamentally it is an art of the stroke or the line executed by the use of the brush (*pi*). Both the strokes and their composition are important. They must be organized according to the general principles of balance and dynamic posture. Each stroke is an end in itself, not merely a line to delineate a form, but a drama, a symphony, a dance with its own beginning and end, anticipation and suspense, delicacy and strength, contrast and harmony. The five calligraphic styles—the bronze or seal, the clerical, the formal or modal, the informal or "walking,' and the cursive or "dancing"—are distinguished not only by their characteristics in composition and general appearance, but also by the peculiarities of their strokes. Individual calligraphers, schools of calligraphy, and even types of calligraphic beauty are so distinguished.

Strokes are carefully analyzed. Traditionally they are classified into the slanting spot, the bridling horizontal stroke, the striving vertical stroke, the springing up-stroke, the whipping left-above-stroke, the skimming left-below-stroke, the pecking right-above-stroke, and the tearing right-below-stroke, all of which are represented in the character *yung*. Each of these strokes is further analyzed into many forms and tendencies, each with its own characteristic force and dynamic expression. It is this drama of force that makes Chinese calligraphy such an interesting art. Famous calligraphers speak of the "nine forces" of calligraphy, the "seven battle arrays of the brush," and "the battle array of writing." As one writer describes it, "Writing is like breaking ice in a crystal jar, light as floating gossamer, or a cloud drifting across a clear sky, violent as an attack of wild beasts, or raging flames sweeping the prairie." The dynamic qualities of each stroke and the organic whole of a character must be such as to realize the "four essentials" of beauty in calligraphy: i.e., *shen* or a style full of spirit, energy, and vivacity; *ch'i* or the strength of the brush stroke; *yun*, rhythm or balance; and *wei* or aesthetic quality and interest and taste. In short, the ideal of calligraphy is rhythmic vitality and life movement.

(b) RHYTHMIC VITALITY. This is precisely what Chinese painting is driving at. The whole art develops on this very principle of "rhythmic vitality and life movement." This is *ch'i yun sheng tung*, the first canon of Chinese painting. The four words may be taken separately as *ch'i* or force, spirit, breath, soul; *yun* or resonance, rhythm, charm, feeling, reverberation; *sheng* or life, the will to live; and *tung* or movement. They may be taken in pairs as *ch'i yun* or spiritual resonance and *sheng tung* or life movement. They are, however, usually taken as one phrase, and often abbreviated to merely *ch'i*, which is fairly well rendered in English as "rhythmic vitality," "operation of the spirit of life movement," "spiritual rhythm expressed in the movement of life," or "the life-movement of the spirit through the rhythm of things." Hsieh Ho of the 5th cent. who formulated the canon neither defined nor explained the phrase, but from his comments on painting which were made on the basis of this canon, there can be no doubt that it denotes a style which expresses the spiritual essence and rhythmic vitality of things. He used such expressions as "the nature of things," "the principle according to which things are," "strong power," "style and charm," "the soul and mystery of things," "spirit," "life force," etc.

In the narrow sense of the phrase, it means rhythm. But in its broader sense, it denotes something more than mere musical quality. It is the creative force, the vitality of all life, the cosmic soul. For a painter to express the *ch'i* of a tree, for example, he must express the tree-nature, its structure, its peacefulness, gracefulness, and above all, the rhythmic vital force which gives it spirit and form. This *ch'i* may be expressed in various ways. As T'ang Chi-ch'i said, "There are different kinds of rhythmic vitality. There is the rhythmic vitality of the stroke. There is the rhythmic vitality

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

of ink. And there is the rhythmic vitality of color. All of these are rhythmic vitality. Furthermore, there is the rhythmic vitality of movement. There is the rhythmic vitality of force. There is the rhythmic vitality of creative power."

(c) CONCEPTION AND BRUSH-STROKE. The fundamental factors of this creative process are two, namely, the conception and the brush-stroke. Of these two, the conception is more important, for according to the general belief of Chinese artists, "The conception precedes the stroke." This saying and also the dictum that "Painting proceeds from the mind" are the basic assumptions of the Chinese graphic art. To be able to express the rhythmic vitality of the object, the artist must first of all know the inner essence of the object and know it so well that he possesses it in his mind. This means a resolute hold on the reality and beauty of things, which can be achieved only after a long period of mental discipline so that there can be coherence and concentration of the artist's mind in relation with the object. The artist must "hold the universe in his hand," so to speak. It is only with this intimacy with the object that the artist can express freely and spontaneously its rhythmic vitality. Consequently, the artist must first of all have the proper conception of the nature of the object, the style, the expression the composition, and the mood before he takes up the brush. The execution of the stroke is an outcome of his conception. It is a translation of the conception on silk or paper. This translation must be accomplished spontaneously, sincerely, and surely, for there can be no "working over" once a stroke is drawn. The nature of Chinese ink and paper and silk prevents erasure or correction.

The stroke in painting follows the same principles as in calligraphy. The main thing is the controlling rhythm of the brush. With perfect control, a stroke may be simple, light, and delicate or varied, heavy, and powerful. It may proceed as a graceful curve or end in a sudden stop. It may progress as a swift and vigorous line or develop as a gentle and wavering stroke. Chinese painters demand "eight essential qualities" in a stroke namely, simplicity, strength, freshness, elegance, penetrative expressiveness, roundness and smoothness, solidness and stability, and ever-changing liveliness. A stroke should have "sinews, muscles bones, and energy," that is, precision, fulness, stability, and force. It must possess the "six fundamental characteristics," namely fulness of spirit, clearness and lightness, rugged maturity, strength, liveliness, and richness. It must avoid the "four defects" of stiffness, dryness, vulgarity, and weakness. It must be free from the "three shortcomings" of flatness, ugliness, and frigidity. It may require a lifetime to perfect. It determines to a great extent the merit of a painter. It distinguishes one school from another. Painters and schools differ in their types of strokes. But they all agree that the primary purpose of the stroke is to express rhythmic vitality. As in calligraphy, the stroke in painting has a drama of its own. But in addition, it expresses the inner essence of the object portrayed and also the conception of the artist.

(d) PAINTING AND POETRY. The formation of the conception and its expression in strokes are primarily intended to evoke a poetic mood, a mood which creates a sense of peace, gives a feeling of release from the vulgarity of city life, and provides a moment of brooding over life. This function of Chinese painting must be fully appreciated before one can understand why in Chinese painting landscape ranks highest, why the painting of the "four gentlemen" (plum, orchid, chrysanthemum, bamboo) form a special branch, and why inscription occupies an unusually important place. To the Chinese, Nature, especially in landscape and the "four gentlemen," is an inexhaustible fountain of poetic inspiration, and a poetic inscription can enhance the poetic mood of a picture. For this reason, Chinese poetry, which draws its chief inspiration from Nature, and Chinese painting always go hand in hand. One is not complete without the other. For this reason, most Chinese painters are poets at the same time.

A poetic mood can be expressed in just a few bamboo leaves or in a bare outline of a mountain range. Since a picture is not an end in itself, but a means to create a poetic mood, it must be beautiful enough to arouse the poetic consciousness instantly. This calls for economy of material and directness of expression. The painter includes only what is absolutely essential in his picture, expresses it in the simplest manner, and leaves a great deal of room for the free exercise of the imagination. The mood so created must continue to change and develop. In this sense, a Chinese painting is never a finished product. It grows with the beholder who places himself in the position of the artist, shares his conception, and carries on his process of re-creation.

To create a varying mood in the most effective manner, the Chinese have developed a form of painting as interesting as it is unique.

This is the **long scroll.** It is a horizontal painting many feet long, to be unrolled slowly and gradually, exposing only one small portion at a time. Each exposed portion is a good picture, good enough to express a full measure of rhythmic vitality and to provide a desired mood. As the scroll is unrolled, one goes from one scene to another, very much like following a symphony, watching a drama, or going through a journey. The rhythm here is three-dimensional, that of the two-dimensional rhythm of ordinary painting and the temporal rhythm of music. The mood changes and develops at every turn.

(e) COLOR AND PERSPECTIVE. The foregoing discussion should be sufficient to show that Chinese painting is allied with poetry (and music) rather than architecture and sculpture. Since the chief objects are the expression of rhythmic vitality and the creation of a poetic mood, it is obvious that color and perspective in the physical sense do not occupy as important a place in Chinese painting as they do in Western painting. To be sure, many Chinese painters paint with colors. But the ideal form of painting, to the Chinese way of thinking, is monochrome, on the assumption that Nature in her essence transcends colors. Chinese monochrome is not monotonous black and white drawing, but a painting in ink which has enormous range of effect and is capable of a great variety of shading and infinite tonal orchestration. To Chinese painters, the different shades of ink are sufficient to produce the effects of color. They resort to ink rather than color for tones and modulation. They say that ink has the "six colors" of black, white, dryness, richness, thickness, and thinness. As to light, shadow, and relief, Chinese painters pay little attention to them, if any, for they are not interested in the physical aspects of things.

In this idealistic type of aesthetics, physical perspective naturally assumes little importance. It is not that Chinese painters have not tried it. Ku K'ai-chih, one of the earliest painters, shows a highly developed sense of physical perspective. Chan Tzu-ch'ien of the 6th cent. is said to have experimented with perspective on murals. A century before that, a theory of geometric perspective was already well established and clearly formulated by Tsung Ping. He said that "if I spread the silk and hold it against an actual scene, the K'un-lan mountain can be included in one square inch. A vertical stroke of three inches on the silk is equal to a height of ten thousand feet, and a horizontal stroke of several feet is sufficient to represent several hundred miles." As a matter of fact, throughout the history of Chinese painting, the confusion of distances has always been regarded as a major blunder.

But Chinese painters have no desire for objective accuracy or factual description. Nor are they interested in mathematical exactness. Geometric perspective is based on a fixed point. This has no appeal to Chinese painters. They want the vision to move on continuously. To them the cardinal principle of perspective is that "the shape of a mountain changes with every step one takes." "A mountain viewed at close range," said Kuo Hsi, "has one appearance; a mountain viewed at a distance of several miles has another. When viewed from a distance of scores of miles, it has still another. The further the distance, the more different the appearance. This is called 'the shape of a mountain changes with every step one takes.'" A landscape painting must show all these changes.

Out of this conception of perspective grows the fundamental law of Chinese landscape composition, the **"law of three sections."** The appearance of the ground as the first level, trees as the second, and mountains as the third, represents the maximum concession of Chinese painters towards conformity with physical Nature. They place things nearby in the foreground and those further away in the background so that distance is conveyed by the movement of the eye from the bottom to the top of the scroll. But, significantly, there is lacking any center of gravity, any focus, or any vanishing point. Chinese artists refuse to arrest reality at a single instant of time or localize it at a single point of space. They want to grasp Nature in her essence, above the realm of space and time, through spiritual intimation and intuitive understanding instead of superficial imitation. In other words, they want to see Nature with an inner eye, with the perspective of the mind. Such perspective goes over and beyond geometric restriction. It is not sufficient to label this perspective as aerial, multiple, or even progressive, for these may still mean the point perspective. The Chinese perspective is that of the poetic mind, the inner vision, a sort of dream perspective if you like. Only with this type of perspective can Chinese painters express Nature as a whole without chopping her into pieces, and reveal her in her essence without distorting her physical appearance.

In such a scheme of perspective, space becomes extremely significant. It not only gives

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

room for the free exercise of the imagination, but also provides an atmosphere of freedom and movement and gives a picture the sense of a satisfying whole. Very often in looking at a Chinese painting, one's eyes travel slowly until they come to some empty space. There they come to rest and there the mind broods over Nature and life. Gradually and unconsciously observation passes over to contemplation. As a result, one's experience is enriched and one's soul ennobled. Thus space is not a negative quality, but something alive, dynamic, constructive. As in calligraphy, it forms an integral part of the whole. As a matter of fact, for its structural and poetic qualities, space in painting draws inspiration from calligraphy. Orchid and bamboo paintings are closest to calligraphy, and it is not a coincidence that space is of special importance in these paintings. Space to these paintings is like air and breeze to the sweet fragrance of the orchid and the graceful bending of the bamboo.

(f) CHIN AND THE SOUTHERN AND NORTHERN DYNASTIES: BUDDHIST PAINTING, SIX CANONS, KU K'AI-CHIH. Chinese painting can be traced to prehistoric times when pottery was decorated with colored figures. From the dawn of recorded history, utensils, garments, banners, maps, and walls were painted with figures and designs. In the earlier part of the Han dynasty (206 B.C.-220 A.D.) murals with portraits of heroes were particularly common; both oil painting and water-color were practiced; and Mao Yen-shou in the reign of Yuan-ti (48-33 B.C.), the first known painter in Chinese history, distinguished himself as an outstanding portraitist. As we shall see in the section on Chinese stone carving, painting had reached a fairly advanced stage by his time. Early in the 3d cent., paper began to supplement silk as a medium.

It was during the Chin dynasty (265-420 A.D.) that Chinese painting was firmly established. This was a period of moral and intellectual revolution. The Confucian formalistic ethics of Han were breaking down. The imagination and the emotions were given free expression in poetry. The romantic, naturalistic philosophy of abandonment of Lao Tzu and Chuang Tzu captivated the literati and won many Confucianists over to Taoism. Buddhism was in ascendency. There was a new atmosphere and a new horizon, full of free spirit and fresh air. It was no wonder, therefore, that all the main branches of Chinese painting—Buddhist painting, landscape (or "mountain and water" as the Chinese call it), flower and bird painting, genre painting ("people and things")—and the basic theories of art all emerged at this time. Furthermore, the substitution at the same time of ink for oil-paint and the brush for the reed provided artists with freer mediums of expression.

The originality of the Chin period can be seen from the works of many of its artists, especially Ts'ao Pu-hsing of the 3d cent. He was an eminent painter of dragons, the common symbol of cosmic vitality. He was the first one to experiment with painting on paper. And, most important of all, he was the founder of Buddhist painting in China. He imitated some Buddhist figures brought to China by Central Asiatic monks and inaugurated the vigorous movement of Buddhist art that was to last for many centuries. This movement gained momentum as the number of Buddhist temples increased and as more and more Indian and Central Asiatic Buddhist paintings were introduced. For some five centuries it dominated Chinese art and hardly any Chinese painter during this time escaped its influence.

The crowning art of China, landscape, advanced at this time from a secondary position as background to portraits to a position of equal importance. With the removal of the Chin capital to Chinyeh (present Nanking), the center of Chinese civilization shifted to the South. Here the Chinese from the North were overwhelmed by the abundance and charm of Nature. Artists were attracted to natural scenery and began to attach importance to landscape. This tendency was already noticeable in Ku K'ai-chih (392-467) who may therefore be considered the forerunner of Chinese landscape. In the beginning of the Southern and Northern Dynasties (420-589), the aesthetic foundation of landscape was laid by Tsung Ping (375-443) and Wang Wei (415-443). The former, as we have seen, had a clear conception of perspective. To him, "landscapes exist in material substance and soar into the realm of the spirit." "Through their shapes, they make the Way of Nature fascinating." He would therefore paint merely to "refresh his spirit." Wang Wei said that "the ancients painted not only to record sites and mark boundaries" but to express their feelings. "In painting," he declared, "what conforms to the object will produce harmony, but it is the mind that reveals the spirit and its life-movements." He believed that the painter should "depict the vast universe in one single stroke."

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

With this type of aesthetic interest predominating, the time was ripe for the formulation of basic principles not only for landscape but for painting in general. This was accomplished by Hsieh Ho (c. 500). He laid down the Six Canons of art. The first and the most important Canon, "rhythmic vitality and life-movement," has been discussed. The rest are: "the structural use of the brush," "conformity with the object," "the application of colors according to their characteristics," "composition," and "transmission of style by copying and drawing". These Canons have been the guiding stars of Chinese painting from the fifth century to the present day.

While principles were being formulated by the aestheticians, the technique of painting was being refined by the Three Masters, Ku K'ai-chih, Lu T'an-wei (5th cent.), and Chang Seng-yu (479-502). Ku was one of the greatest painters in Chinese history. He was the first to practice outline drawing without color, shading, or wash. He was a great master of the "iron wire stroke," that is, the long, even, and flowing line drawn by a vertical brush. According to the *Hua Chi*, "In painting beautiful figures, Chang gives us the flesh, Lu gives us the bones, but Ku gives us the spirit." Copies of Ku's paintings in the British Museum and Freer Gallery show that his style has delicacy, lightness, refinement, and the rhythmic vitality of the brush-stroke. There is supreme elegance of form and poetry of attitude. His figures have graceful gestures, gentle manners, humane dignity, ivory faces with refined and subtle charm, and long, floating garments. In the words of the arch-critic Chang Yen-yuan, "His conception preceded the stroke . . . and therefore he achieved a perfect expression of spirit and rhythmic vitality." Lu T'an-wei was a master in all types of painting, especially Buddhist figures and dragons. His chief distinction, however, lies in his creation of the "one stroke painting" to which he applied the style of Wang Hsien-chih who wrote characters in one continuous stroke. Chang Seng-yu, besides being an expert painter of Buddhist figures and dragons, introduced the Indian technique of carved relief into Chinese painting, invented "painting without bones," that is, painting without preliminary outlines, and applied green and blue and red colors to his landscape, thus anticipating the "green and blue" painting of later periods.

None of the innovations of Lu and Chang, however, attracted much following. In the two centuries after them, Chinese artists chiefly confined their interest to Buddhist painting, and, to a lesser degree, to landscape, with Ku K'ai-chih's stroke-manner as the standard style. Both Buddhist painting and landscape continued to develop slowly through the Sui dynasty (581-618), with Buddhist painting predominating. The two outstanding artists of this era were Chan Tzu-ch'ien and Tung Po-jen. The former is generally considered to have laid the foundation of painting in the following T'ang dynasty.

(g) T'ANG: WU TAO-TZU, SOUTHERN AND NORTHERN SCHOOLS OF LANDSCAPE, PAINTING AND POETRY, PAINTING OF THE LITERATI, BUDDHIST PAINTING. The T'ang dynasty (618-907) gave China her greatest painters, notably Yen Li-te and his brother Li-pen (d. 673), Wu Tao-tzu, and Wang Wei (Mo Ch'i). The Yen brothers were exquisite in all styles, especially in Buddhist and Taoist figures. Wu Tao-tzu was epoch-making. And Li Ssu-hsun and Wang Wei founded the two rival schools of landscape. Few, if any, of their original paintings have been preserved. But from early copies of their works their styles can be clearly discerned.

The world is unanimous in calling Wu Tao-tzu (d. 792) the greatest of Chinese painters. To the Chinese he is "the sage of painting." In him, landscape declared complete independence from portraiture and started its way to pre-eminence as the greatest art of China He was "perfect" in technique. In the words of Chang Yen-yuan, "In Wu's style we have the complete realization of the idea that the conception precedes the brush. . . . All the Six Canons are perfectly realized. In him, the stroke, especially the "orchid leaf line" which curls and changes in the middle to produce hues and enhance rhythm, achieved excellence. It is graceful, interesting, vehement, lively, vibrating, like "a ribbon flowing and dancing in the wind." It is no longer the delicate and fine stroke of his precedessors whom he at first followed, but "dynamic as the sudden wind and rain and forceful as lightning and thunder." Su Tung-po the poet-painter said that Wu was the only person in Chinese history "able to express new conceptions in ordinary patterns and to reveal essential truth in an unrestrained manner." As such he was the envy of all later Chinese painters. There is no doubt that Wu Tao-tzu drew his chief inspiration from calligraphy, and it was not a mere coincidence that his pupil Chang Hsu created the extremely swift, cursive, "entwining rope" style in calligraphy. Wu's style also reflects a certain Buddhist influence. He was

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

equally a master of Buddhist and Taoist figures. It must be born in mind that throughout the Sui and T'ang dynasties, religious figures were the central interest of Chinese painters, although landscape began to offer strong competition.

Wang Wei (699-759) and Li Ssu-hsun (651-716) are traditionally called the founders of the Southern and Northern Schools of landscape, respectively. What they actually did, however, was to crystalize two divergent tendencies that had been asserting themselves for some time. The Southern School is characterized by the romantic and Taoistic spirit of the South, poetic suggestion, pliant lines, free and fast strokes, soft shades, subtle colors, imaginative quality, emotional expression, and a romantic, dreamy, and melancholic mood. There is in this school a keen sense for the spiritual and the most essential, a free intuitive mode of creation, a feeling of wonder and fancy, and the atmosphere of fresh air. The Northern School, on the other hand, is distinguished by the use of greens, blues, gold outlines, vigorous and rugged strokes, a formalistic and intellectual approach, vehement and bold execution, care for details, and a sense of stability and dignity. The landscape of the Southern School is often called "thin ink landscape," whereas that of the Northern School "landscape in greens and blues." The style of the former is often compared to delicate and graceful trees by the side of a lake, that of the latter to lofty and steep mountains. The Southern School uses the "rain-drop" stroke, that is, shading by the small, pointed, oval strokes, whereas the Northern School uses the "small axe" stroke, that is, shading by small strokes resembling axe splits. Actually, painters of one school also use the stroke of the other. The two schools did not develop in different geographical regions as their names may imply. They merely represent two different approaches to landscape, evidently inspired by and corresponding to the Southern and Northern Schools of Zen Buddhism. Famous followers of the Southern School were Ching Hao and Kuan T'ung of the Five Dynasties; Tung Yuan, Chu Jan, Li Ch'eng, Fan K'uan, Kuo Chung-shu, Li Lung-mien, Mi Fei, and Mi Yu-jen of Sung; the Four Masters of Yuan; and Wen Ching-ming and Shen Chou of Ming. Famous followers of the Northern School were Chao Kan, Chao Po-chu, Chao Po-hsiu, Ma Yuan, Hsia Kuei, Li T'ang, and Liu Sung-nien, all of Sung. Historians have classified practically all Chinese painters in the last ten centuries in one school or the other. Few painters, however, follow the style of one school exclusively.

To some extent the styles of the two schools reflect the environment and personality of their two reputed founders. Li Ssu-hsun was a member of the imperial family, served as a general, and enjoyed a life of aristocracy and nobility. Wang Wei, on the contrary, was a poet who loved streams and rocks and music and books, a hermit in his last years and one who shared the Buddhist and Taoist dislike of the vulgar life of the troubled world. He was an idealist who cared for the inner nature of things, not hesitating to paint flowers of different seasons in the same painting. He was as great a poet as he was a painter. It is often said that "there is poetry in his painting and there is painting in his poems." In him the mutual penetration of poetry and painting became complete. Beginning with him, monochrome was regarded as the best form for the expression of poetic sentiments. Beginning with him, too, the "broken ink" landscape became the ideal of Chinese landscape painters. Instead of the traditional outlined painting filled in with colors, in this original style of Wang We. the configuration is effected by shading ("wrinkling") with woolly, light-colored ink-strokes. The soft and changing tones of this ink-painting render an atmospheric perspective both effective and charming. There is something fluid and ethereal about the style. This intuitive approach and free rendering definitely reflects the influence of Zen Buddhism which advocated "sudden enlightenment" and "direct intuition of Buddha-nature." Such a tendency suited the taste of the literati extremely well, and this poetic and subjective type of painting became known as "the painting of the literati." It has become the strongest tradition in Chinese painting, exerting no less influence today than it did a thousand years ago.

In addition to these new conceptions and new tendencies, the T'ang dynasty is important in the annals of Chinese painting in several other respects. First of all, the earliest paintings on silk or paper still existent belong to this period. Secondly, flower and bird painting developed in this era as one of the basic types, thanks to Pien Luan who brought the art to the level of excellence. Thirdly, specialization in painting began in this period. Many artists devoted their whole lives to perfect just one subject, be it the horse, dragon, tiger, water buffalo, a fruit, a bird, an insect, pine tree, bamboo, plum, water, fire,

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

or clouds. The horse was particularly favored, undoubtedly because of the beauty of foreign horses newly imported from China's western neighbors. Both Tsao Pa and his pupil Han Kan (c. 700) excelled in this subject. In the fourth place, genre painting, especially that of beautiful women and their life in the court, the garden, or the home, a type of painting in which Chou Fang (c. 780) was outstanding, created a new conception of feminine beauty. Finally, Buddhist painting no longer imitated Indian models but became entirely Chinese in conception and manner. This is in sharp contrast to the Buddhist frescoes which remained partly foreign, were works of artisans, and were provincial in outlook. The most celebrated pieces are those discovered in the Tunhuang caves in 1907 and now mostly in the British Museum. They are admired by Westerners for their perfect combination of Chinese artistic conception and Indian imagery and formula, their tender and majestic figures, their graceful and gentle drapery, their profoundly religious feeling, their serene composition, and their harmony of colors. Because their lines lack the calligraphic quality, however, they are not highly regarded by the Chinese.

(h) SUNG: THREE MASTERS OF LANDSCAPE, MI FEI, LI LUNG-MIEN, ACADEMY, FLOWERS AND BIRDS, "PLAYING WITH INK." In the Five Dynasties (907-960) that followed T'ang, the Southern School, especially its "painting of the literati," became dominant. Bamboo painting, the most characteristic form of this type of painting, began at this time. Flower and bird painting reached new heights in Hsu Hsi and Huang Ch'uan, who became the standards of later generations.

Hsu Hsi used mere drops of ink to form his leaves, branches, and flower buds and then slightly spread colors on them. In this way he achieved an antique and distinctive effect. He is usually regarded as the representative of the Southern School in flowers and birds. Huang Ch'uan, on the other hand, first drew outlines and then applied brilliant and rich colors. In this way he achieved richness, charm, and a high degree of singular lightness and pervasiveness. He is usually regarded as the representative of the Northern School. The two exerted tremendous influence over flower and bird painters of subsequent dynasties, notably Chao Ch'ang and Emperor Hui-tsung of Sung, Ch'ien Hsuan and Wang Yuan of Yuan, Pien Wen-chin, Lu Chi, Lin Liang, and Chou Chih-mien of Ming, and Yun Shou-p'ing and Chiang T'ing-hsi of Ch'ing.

Landscape in the Five Dynasties was predominantly Southern in spirit. There was no longer the delicacy of Chin or the peace and plainness of T'ang. Instead, it breathed an air of magnificence and power. With economy of strokes and loftiness of conception, both Ching Hao and Kuan T'ung, the two stars of the epoch, effected a strange vastness and overwhelming grandeur. As Hsu Hsi and Huang Ch'uan prepared for the "grand perfection" of flower and bird painting in the Sung dynasty, so they paved the way for the "grand perfection" of landscape in that dynasty.

The Sung period (960-1279) compares favorably with and in some respects surpasses T'ang in the field of painting. There was a greater host of masters than in any other period. The collection and study of paintings, enthusiastically encouraged by such artist-emperors as Hui-tsung (1083-1135), have never been equaled in Chinese history. Academies of painting were liberally supported by the government, and painting became a required subject both in the schools and in the competitive civil service examination. For three long centuries, the art of painting enjoyed unusual prosperity.

Under the influence of Zen Buddhism and the Confucian philosophy of *li* or Reason, that is, the inner principle of things, Sung aestheticians emphasized spiritual essence to the complete rejection of physical verisimilitude. The spirit of the Southern School dominated the age, in landscape, in flower and bird painting, and, especially, in "playing with ink." In all these arts, poetry was the end and calligraphy the means. Poetic inscription assumed more importance. Painting was exclusively the art of the literati.

Landscape reached the point of excellence at the beginning of the dynasty. Forms and styles were "completed" by the Three Great Masters, Tung Yuan (c. 903), Li Ch'eng (c. 970), and Fan K'uan (c. 977). They were all influenced by Wang Wei the poet-painter. Tung Yuan followed Wang Wei in his ink-painting, but resembled Li Ssu-hsun in the application of colors. He loved to paint the distant hills and changing clouds of the South in their natural simplicity, was exceedingly good in painting trees, woods, bridges, rivers, fishermen, and islands, all instinct with a sense of rural life and beauty. Li Ch'eng's ink-painting, coming from his free and sensitive brush, is precise, economical, subtle, especially effective in scenes of distant winter groves.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

He could "sweep a thousand miles in the space of one foot and create ten thousand charms beyond mountain peaks." He combines ink-painting with greens and blues in perfectly harmonious blending. Fan K'uan is famous for his snow scenes, dense groves on mountain tops, and huge rocks by the water's edge. His strokes are strong and rugged, his "raindrop" shading unique. He said, "It is better to learn from things than from people, and it is better to learn from one's own heart than from things."

These Three Masters held complete sway over the artists of their own period and the period immediately following. Hsu Tao-ning, Yen Wen-kuei (967-1044), Kuo Hsi (c. 1085), etc. followed Li Ch'eng, while Chu Jan (c. 930), who is sometimes called the fourth master of the period, and his pupils followed Tung Yuan. An outstanding painter of the time independent of them was Kuo Chung-hsi (c. 985), an expert in "measured painting," that is, architecture in landscape.

The influence of the Three Masters produced a great change in landscape about a century later. This change took place in Mi Fei (1051-1107) and his son Yu-jen (1085-1165), indisputably the greatest painters of Sung. With them Chinese painting entered upon a new epoch. Like Wang Wei, they are subjective, poetic, suggestive, imaginative. But unlike Wang Wei, they painted almost exclusively in monochrome and worked with tones rather than strokes. They painted in their novel "spilled ink" style, that is, piling wash upon wash as though working in oil. With heavy and broad touches they produced forcible silhouettes, vast mountain ranges, strange wooden peaks rising above rain and mist. They are especially admired for their "clouds and mist" and their ethereal atmosphere Mi Fei developed an original style of using clouds and mist to cover partially the trees. His son's landscape pictures seem to be composed of dots and dashes for the clouds and mist, made in a slipshod and hurried manner, and yet true to life. Both father and son possessed an intimacy with Nature and a conception of the universe in its inner essence never approached by other artists. Their mist, rain, and clouds are force, movement, and rhythmic vitality pure and simple. Their clouds and mist "flow across the scroll."

Another great painter of the time was Li Kung-lin, better known as Li Lung-mien (b. 1049). He was accomplished in all fields. His lines, particularly the curves, are delicate, flexible, fluid, rhythmic, harmonious, "comparable to wandering clouds and running streams." He achieved consonant blending and perfect balance of different traditions. "He was better than Han Kan in painting horses, surpassed Wu Tao-tzu in Buddhist figures, equaled Li Ssu-hsun in landscape, and matched Wang Wei in his manner of ink and strokes." He is generally praised as the one painter since Wu Tao-tzu to have realized all the Six Canons of art, a "grand synthesis" of all masters. He was the greatest painter of religious figures of the Sung dynasty, especially the *lohan* or the Buddhist saint. He painted in black and white, setting a new style in figure painting. After his time Buddhist painting degenerated into an art of purely technical skill, partly because there was no new religious impulse and partly because Zen Buddhism deprecated art in favor of meditation and intuition.

After the Sung capital was moved to Nanking in 1127, the Southern School suffered a temporary setback. Practically all outstanding painters of the time were members of the Imperial Academy. They often painted more worldly scenes in a more realistic manner to please the emperors. Consequently the style of the Northern School became the vogue, complete with its delicacy, refinement, attention to details, and love of brilliant colors. This fact, of course, did not prevent its painters from being great or creative. Li T'ang (1049-1130), for example, distinguished himself for painting huge rocks with the "big axe splitting" stroke, thus altering the traditional stroke-manner of the Northern School. For the "vertical brush" which Li Ssu-hsun and other earlier leaders of the Northern School employed, he substituted the "slant brush," thus making a radical change which sharply differentiated the Northern School and the Southern School which continued to use the "vertical brush." He also could create an impression of roaring waves without the traditional "fish scale" line. He was superb in painting water buffaloes. Other great academicians were Chao Po-chu and his brother Po-hsiu (c. 1130) and Liu Sung-nien (1073-1157).

Before long, however, the Southern School reasserted itself, even within the Academy. Ma Yuan (c. 1195) and Hsia Kuei (c. 1208), both academicians, produced another change in landscape by synthesizing the style of Li T'ang and the ink-painting of the Southern School Their works show greatness of conception and broadness of stroke. They achieved strange effects by daring simplicity. Their plants seem to be alive and mountains seem

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

to rear themselves with fierce energy. Their "heavy ink" or dense, black ink applied with the brush fairly dry, which was an innovation, has the fascinating effect of strength and antiquity mixed with fluidness. Equally splendid are their "axe split" strokes. They have been rightly called the school of "strong and antique ink-painting." They clearly betray the influence of the Three Masters and Mi Fei. In their expansive mood and rough manner, they erred in over-simplicity and abruptness. Their style was transmitted through Tai Wen-chin of Ming and later artists.

In flower and bird painting, the style of Huang Ch'uan was continued by his son Chu-ts'ai (b. 933) and that of Hsi Hsi by his grandson Ch'ung-ssu. Because of his aristocratic life in the Academy, Huang Chu-ts'ai not only perpetuated the richness, splendor, and elegance characteristic of his father but added to them sweetness and charm. He became the model of flower and bird painting in the Academy. His authority was not challenged until Ts'ui Pai (c. 1070) who modified the Huang Ch'uan tradition by substituting freedom for refinement and by introducing new forms. Hsu Ch'ung-ssu, Huang's rival outside the Academy, painted without outline but with rich colors. Beginning with him the Hsu Hsi school developed into two branches, one of ink-painting with subtle colors and one with rich colors but without "bones" or outlines.

At about this time a new tendency in the treatment of plant life commenced. This is called "playing with ink." Its subjects include groves, rocks, simple landscape, and plants. But the plum, the orchid, the chrysanthemum, and the bamboo are most favored. They are called the "four gentlemen," obviously because of their gentlemanly qualities. Artists painted them in the manner of the literary man to express their care-free feelings. Without the slightest attention to detail, convention, or factual accuracy, they painted like a child, spontaneously, freely, intuitively. They merely "played with ink" to suit their own tastes, to reveal their thoughts, and to express their feelings. They spoke of "writing" bamboo or plum, instead of "painting." Overcome by Zen Buddhism and the philosophy of *li* (inner principle of things), they "forgot both spirit and matter," but maintained an attitude of "seriousness" towards things, that is, an attitude of intimacy and identification with things. They religiously obeyed the principle that conception precedes the brush. They wanted rhythmic vitality, subtlety, simplicity, purity, and spirituality. The result is a highly idealistic art, lofty in conception, simple in form, light in spirit, deep in poetic feeling, and calm but strong in rhythmic vitality. There is no artificiality, formality, or heaviness, but a child's delight coupled with a literary man's sense of nobility, refinement, and serenity. Almost all Sung painters "played with ink." Some devoted their whole lives to trying to master the art of painting bamboo. The two leading bamboo painters were Wen T'ung (1018-1079) and Su Tung-po (1036-1101). The former was the greatest master of bamboo in ink, while the latter was absolutely unconventional in handling his subject. Su Tung-po, himself a poet of the first order, said in a poem that "If in judging a painting you seek natural resemblance, you have the vision of a child." He therefore did not hesitate to paint bamboo in red or without joints. In him and in his circle, the painting of the literati reached its peak.

(i) YUAN: "CONCEPTION," FOUR GREAT MASTERS, INSCRIPTION. The literary tradition persisted throughout the Yuan dynasty (1280-1368). But instead of emphasizing the *fa* (technique) of T'ang or the *li* (inner principle) of Sung, Yuan artists concentrated on *i* (conception). The majority of artists "played with ink," were unusually fond of painting orchid and bamboo, liked to paint figures in outlines without color or shading, and put the poetic conception ahead of everything else. There was no longer the nobility, dignity, and spirituality that characterized the painting of Sung. These were replaced by melancholy, eccentricity, and purely subjective construction.

This is not to say that the Yuan dynasty had no great painters. Both Ch'ien Hsuan (1239-1302) and Chao Meng-fu (1254-1322) and later the Four Great Masters compare favorably with the masters of T'ang and Sung. Ch'ien and Chao continue the style of Li Lung-mien and retain the temper of the Sung painters. The former is good in figures, landscape, and flowers and birds. He combines strength and loftiness with tenderness. The latter is celebrated for all types of painting. His horses have excellent poses and a high degree of feeling and movement His landscape shows perfect blending, lofty conception, masterly organization, and a sense of unity. The lines of his flowers and birds are simple, vibrant, and flexible. He applied the technique of carving and calligraphy to painting bamboo. As generally agreed, "he has all the delicacy of the T'ang artists without their

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

weakness and all the strength of the Sung artists without their coarseness."

The Four Great Masters of Yuan were Huang Kung-meng (1268-1354), Wang Meng (d. 1385), Ni Tsan (1301-1374), and Wu Chen (1280-1354). They carried on the tradition of the Southern School, following particularly Tung Yuan and Chu Jan. Their chief concern was poetic conception and rhythmic vitality. Their numerous mountain ranges and thick groves never cease to be interesting. Their strokes are extremely strong. They all used the "dried brush," that is, the technique in which the ink is used sparingly, with little moisture in the brush. In this they set a new style. Huang Kung-meng mostly painted in light red in which he combined strength and richness, and sometimes in simple ink and water in which he achieved telling effect with very little shading or "wrinkling." His pictures of hills and dales have ever-changing aspects and manifold beauty. Wang Meng who preferred to paint on paper rather than on silk, followed his grandfather Chao Meng-fu chiefly but applied the technique of shading-wrinkling of different schools, and therefore had richness and variety in his art. He led a roaming life and had nothing professional about him. As a matter of fact, most Chinese painters have been amateurs, but Wang was the most amateurish of all. Ni Tsan was the greatest master of the "dried brush," was "economical of ink as if it were gold," liked suggestion and simplicity, and was reticent and delicate in manner, placid and natural in style. He did not put human figures in his landscapes, and seldom used color. Like Wang, he lived a roaming life and was entirely free from the vulgarity of city life and the worldliness of the professionals. Wu Chen was expert in flowers in ink, figures, and landscape. His strokes are spirited and strong. Thus all the Four Masters were faithful to the Southern School tradition and yet each was unique in his own way.

Beginning with the Four Masters, inscriptions on paintings played a role of real importance. Poetic inscriptions were placed in prominent parts of the painting to re-enforce it in evoking a poetic mood. The unity of poetry and painting was thus strengthened. Calligraphy, too, was completely identified with painting. "Playing with ink" became "writing" *per se*. Different parts of bamboo, for example, were to be "written" in the styles of various written scripts.

(j) MING: FIGURES AND LIFE, LANDSCAPES. The care-free spirit of Chinese art rapidly declined in the Ming dynasty (1368-1644). Because of the dogmatic temper of rulers and the general concern for external matters of the time, artists lost their self-confidence. They were not at home with either the *hsing* (appearance), the *li* (inner principle), or the *i* (conception). They became formalistic, academic. They loved brilliant colors, over-laden composition, fine but laborous and meticulous lines, ornament, and nicety. They were increasingly interested in life and figures. They were more imitative than creative. The sixth canon, transmission of style by copying and drawing, meant to them not so much knowing great masters intimately in order to improve one's own style as meaningless imitation.

In spite of this enthusiasm for imitation, however, the Ming dynasty is not devoid of creative genius. It is found in both figure painting and landscape. Many artists painted Taoist and Buddhist figures, but as the religious impulse of the age was low, accomplishment in this field was negligible. Portraiture was more successful. The most remarkable achievement in figure painting, however, lies in the painting of feminine life and its surroundings. While the Ming painters of figures followed closely the technique of T'ang and Sung, they had a refinement, richness, and beauty of their own. The charming faces, elegant gestures, and supple gait of their figures are still an inexhaustible fountain of pleasure. Almost all Ming painters were productive in its line, but Ch'ou Ying (c. 1530) was the greatest of them all. It should be added that like painters in other periods, they were interested in atmosphere, expression, and psychological feeling, but not in physiological features. The human figure has never had much importance in Chinese painting, and the nude none at all.

The backbone of art in the Ming period, as in other periods, was landscape. Landscape painters far exceeded those of Sung and Yuan in number. They shunned the liberality and expansiveness of Yuan and as a reaction took special delight in minute details, in studied brush work, and in queer cliffs and odd rocks. There were many schools, each emphasizing or synthesizing certain preceding styles, but they fell under three major groups.

The first group is the Chekiang School. Painters in this group, all from Chekiang, hardly used color, imitated Ma Yuan and Hsia Kuei of Sung, but replaced their depth and quietness with a livelier tone. They became the stronghold of the Academy Tai Wen-chin (c. 1430), leader of the group, was

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

expert in all types of painting and masterly in broad and free strokes. He distinguished himself in using in his figures the "iron wire" or the even, hard, and still line and also Wu Tao-tzu's famous "orchid leaf" line.

The second group was the Academy School led by T'ang Yin (1470-1523) and Ch'ou Ying. Members of this group tended more to the Northern School tradition than that of the Southern School, although in their technique they followed the Chao brothers Liu Sung-nien, and Li T'ang. They worked with greens and blues and gold outlines, had a strong taste for buildings and "measured painting," were fine in drawing and skilful in details, had richness, softness, and grace. There is prettiness, charm, elegance, and delicacy in them. The pictures of T'ang Yin have a suppressed kind of strength in them, giving a weird effect. Ch'ou Ying's paintings have classic elegance.

The most influential group was the third school which flourished outside of the Academy from the beginning of the sixteenth century and made a strong impression on the following generations. This is the Wu School, so named because its members all came from Wu and its neighborhood in Eastern China. The Wu painters rejected Ma Yuan and Hsia Kuei as "insane," and wanted to combine strength and broadness with elegance and tenderness. Their leaders Shen Chou (1427-1509) and Wen Cheng-ming (1470-1559) more than accomplished this aim. Shen Chou painted big branches and enormous leaves with just a few broad and powerful strokes. In landscape he was particularly skilful in monochrome. Never careless in his drawing he was powerful and fluid. Wen Cheng-ming closely followed Chao Meng-fu and Tung Yuan, approached them in rhythmic vitality, spirit, and charm, and probably surpassed them in ease and calmness. His lines are careful and delicate, his colors charming and elegant. The greatest master of the school, however, was Tung Ch'i-ch'ang (1555-1636) who combined the styles of Ching Hao and Huan T'ung of the Five Dynasties, Tung Yuan and Chu Jan of Sung, and the Four Masters of Yuan. His feeling is that of the learned man and his conception that of a noble soul. Out of him grew many schools of painting. He is the chief justification for the common contention that the landscape painting of Ming synthesizes the best elements of the past and sets the pattern for the future.

Both in flower and bird painting and in "playing with ink," Ming talents made a fairly good showing. Painters of flowers and birds generally followed Hsu-hsi and Huang Ch'uan. Painters "playing with ink" emphasized conception. They were particularly at home with bamboo and plum in monochrome. Although Ming art definitely lacks creativeness and high inspiration, it nevertheless has neatness of conception, clear definition of form, sobriety of composition, just sentiment for decorative effect, suppleness of stroke, harmonious coloring, and a fine taste in general.

(k) CH'ING: LANDSCAPE, FIGURE PAINTING, FLOWER AND BIRD PAINTING, WESTERN INFLUENCE. The Ch'ing dynasty (1644-1911) continued the major traditions of Ming. The whole period was dominated by the style of the Southern School transmitted through the Wu School. There were imperial encouragement, extensive collections, comprehensive study of previous works, and a great number of artists, probably totaling six or seven thousand.

In landscape the outstanding names of the period are the four Wangs, namely, Wang Shih-min (1592-1680), Wang Chien (1598-1677), Wang Hui (1632-1720), and Wang Yuan-ch'i (1642-1715). These four, Yun Shou-p'ing (1633-1690), and Wu Li (1632-1718) are called the Six Masters of early Ch'ing. Wang Shih-min, leading figure of the group, modeled after Tung Ch'i-ch'ang. There is a natural ease and a mastery of technique in his employment of dots and dashes which are very striking. Wang Chien, also following Tung, was accomplished both in ink-painting and in watercolor drawing. He often painted in greens and blues but avoided details and thereby synthesized the Southern and Northern styles. He is full of expression. He has an austere and antique beauty. His colors are so chosen as to give an atmosphere of culture and repose. Wang Hui has spirituality in content and life-movement in form, is good both in delicacy and in simplicity. He also synthesized the two schools. Wang Yun-ch'i's strokes are like carving on bronze. He has richness, mellowness, depth, and volume. Yun Shou-p'ing was outstanding in landscape but his real greatness lies in the field of flowers and birds. Wu Li believed in imitation and careful strokes. Being a Roman Catholic, he was influenced by Western painting. These Six Masters gave rise to many schools. Practically no subsequent landscape painter was free from their influence.

Figure painting in the Ch'ing dynasty was almost entirely secular. Hardly more than

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

one artist in a hundred was interested in Buddhist and Taoist figures. In drawings of secular life, however, there were no less than five different schools. These include, first of all, that which followed Ch'ou Ying and paid chief attention to elegance; secondly, that which emphasized the classical style with its simplicity and greatness; thirdly, that which stressed lightness and outline drawing; fourthly, that which expressed its conception in ink-painting; and finaily, that which was influenced by Western art. Chen Hung-shou (1599-1652) was an early master of all types of figures. Yu Chih-ting (b. 1647) was the outstanding painter of the entire period. Chin Nung (1687-1764) was the greatest master in religious figures. Giuseppe Castiglione the Italian Jesuit (Lang Shih-ning, 18th century) painted with Chinese material in the Chinese style in general but brought in a great deal of Western relief, perspective, and touch, giving the impression of a combination of Chinese painting and Western oil. He attracted few followers.

The most note-worthy accomplishment of the Ch'ing dynasty lies not so much in landscape or figure painting as in flower and bird painting. The glory that was Yuan and Ming was transmitted through Chu Na (Pa Ta Shan Jen, c. 1644) and his contemporary Shih T'ao (Tao Chi). Chu Na was free from conventional concepts and technique. There is in his few, simple, and powerful strokes much loftiness and nothing vulgar. Shih T'ao was the pre-eminent painter of flowers and birds of his time. His work is as eccentric as his person. By far the most celebrated master was Yun Shou-p'ing (Nan-t'ien) who is regarded as the greatest flower and bird painter in the Ch'ing dynasty, if not in Chinese history. Based on the Southern tradition of Hsu Ch'ung-ssu, he has lightness and neatness, as well as greatness, splendor, and dignity He painted without even the faintest outline, bringing the "boneless" style to a climax. He and his contemporary Chiang T'ing-hsi (1669-1732) set the standards for later generations. There were many followers, forming different schools. Of these followers, perhaps the most distinguished was Chin Nung (Tung-hsin) whose skill in calligraphy and seal carving gave his lines a peculiarly calligraphic and "bronze and stone carving" quality. He excelled in plums, bamboos, and horses. His coloring is unique. Hua Yen (Shin Lo Shan Jen, b. 1684) exercised the greatest influence over flower and bird painting in the latter half of the Ch'ing dynasty. His works are remarkably alive, permeated with a spirit of imaginative beauty. Chao Chih-ch'ien (1829-1884) combined the best of Chu Na Shih T'ao, and Hua Yen. Full of richness, majesty, and vitality, his works are also dignified, refined, and always full of interest. Wu Chun-ch'ing (1844-1927),the greatest painter in the last century, was unrestrained, care-free, informal, lavish. In his unconventional spirit and expansive mood, there is freshness, novelty, vibration, expressiveness, power, maturity, and ruggedness attained by economical but strong and vehement strokes. He was a celebrated calligrapher of ancient scripts His strokes have the appearance of odd rocks and old vines characteristic of those ancient scripts.

(1) THE FUTURE. With the establishment of the Republic in 1912, China looks to the West for the solution of her problems. Painters likewise look to the West for new inspiration. Outstanding Westernists like Hsu Pei-hung, Liu Hai-su, Ch'en Shu-jen, and Kao Chien-fu, whether learning from the West directly or by way of Japan, created new styles. They emphasize light and shade and power of expression. They paint new subjects, especially those in daily life. They want to liberate Chinese art from the chain of old conventions and traditions. Their challenge has been strong and their influence extensive. Nevertheless, Chinese painters in general still devote their chief attention to landscape and flowers and birds, still rely on balance as the basic principle of composition, still center their technique around the stroke, still remain faithful to the major traditions of the Southern School. They have refused to give up their peculiar perspective in favor of the point perspective, or to allow light and shade much importance, or to divorce Chinese painting from calligraphy and poetry. The most renowned Chinese painter of the day, Ch'i Pai-shih, who is most celebrated for his "insects and grass" and flowers and birds, is not a Westernist. It may well be that future Chinese painters will paint a much greater variety of subjects. It may well be that they will use color as a medium of expression instead of decoration as it has been in Chinese art. It may well be that Chinese painters will be more creative and individualistic as Western painters are. In these three respects Chinese painting will likely learn from the West. But unless the Chinese people radically change their attitude towards calligraphy, poetry, and life in general, the basic philosophy and the basic technique of Chinese painting will remain essentially Chinese.

*Stone Carving.* To the Chinese, stone carving (*shih k'o*) is essentially calligraphy and painting executed on stone. Unlike Western sculpture, it is not primarily carving of figures in the round. As a matter of fact, in Chinese stone carving as in Chinese painting, the human body has little significance. The chief interest of stone carving lies in the line.

(a) STONE MONUMENTS. The art of carving goes back to times immemorial. In the Shang period (1765-1122 B.C.) carving on jade and bronze had already become a mature art. Whether stone carving rivaled carving on jade and bronze at the time, history does not tell. From literary records we know that at the end of the fifth century B.C., there were over 10,000 incised inscriptions on rock *in situ* commemorating the virtues and accomplishments of great men. All of these inscriptions have disappeared. The earliest stone monuments still extant are the well-known stone drums. They are ten in number, each three feet high. They were discovered in Shensi in the 7th century, moved to the Confucian Temple in Peiping in 1307, and transferred to Nanking in 1933. There are odes inscribed on them probably during the reign of King Hsuan (827-782 B.C.) to commemorate his expeditions. It is possible, however, that they belong to the Ch'in period (249-206 B.C.) as Prof. Ma Heng contended in 1923. At any rate the Ch'in period was an epoch in which engraving on stone tablets was commonly practiced. A number of these tablets have come down to us. They are very highly treasured by the Chinese literati for the excellent writing engraved on them. Their rubbings have served as models of calligraphy for many centuries.

In the Han dynasty (206 B.C.-220 A.D.) stone carving reached a very advanced stage. In addition to inscribing on precipices, there was the inscribed memorial pillars which was not known before. Some of these pillars are still standing, the oldest one dating back to 105 B.C. Their forms are dignified and majestic, their carving refined and strong, and, above all, their pictures and writing are among the best in Chinese history.

There was also the stone tablet. It was not new in the Han dynasty; it can be traced to the eighth century B.C. or even earlier when it was used as a sundial, as a memorial of thanksgiving placed in front of a temple, or as a post at the side of grave pits to facilitate the lowering of heavy coffins. But it was in the Han era that it assumed unusual importance in art. Its purpose was still utilitarian, for use in lowering coffins. Long poles were inserted in the circular bores near the top of the tablet and the coffin was lowered with ropes suspended from the poles. But its writing and pictures are masterpieces of art. Rubbings of these masterpieces are today, as they have been for many centuries, models of Chinese calligraphers and stone carvers

A tablet was either circular or in the shape of *kuei*, that is, circular at the top and square at the bottom. The circular type has entirely disappeared. The other, however, has been preserved. The oldest tablet of this latter type is dated 25 B.C. As a rule, characters are engraved in the center to commemorate the deceased, and dragons and tigers are carved on both sides with a couple of mythological birds on top and tortoises at bottom. From the standpoint of art, the characters are the most important. It is they that rank the Han tablet as a supreme achievement in Chinese art.

As calligraphy is the triumph of the Han engraved tablet, so is painting the crowning success of the Han carved murals. The carving of figures on palace and temple walls started in the Chou period, but the most famous works existent today belong to the Han dynasty. In the Hsiao T'ang Shan Temple in Shantung province, a temple built in the latter part of the Earlier Han period (206 B.C.-24 A.D.), there are carvings on ten stone walls depicting historical, military, theatrical, and mythological scenes. As stone records of ancient civilization, they are the most ancient and as such are important enough. But they are even more important as works of art. Their clearness of conception, mastery of composition, excellence of execution, and gracefulness of expression have never been surpassed.

In the Wu Liang Temple, also of the Han period (147 A.D.) and also in Shantung, there are carvings on stones 4 ft. by 2 or 3 ft., in four stone chambers. Pictures are in bas-relief, arranged in two or three horizontal stories which possibly represent upper and lower floors but probably describe different scenes without any temporal or architectural relationship. There are scenes about ancient rulers, sages, heroes, filial sons and loyal ministers, military expeditions, funeral processions, the presentation of tribute, etc. Figures are extremely lively and individualistic. The narration of tales is clear. The composition of groups is pleasing.

Neither the Hsiao T'ang Shan nor the Wu Liang Temple carving shows much plastic

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

quality. This is so because the Chinese regarded stone carving as essentially calligraphy and painting translated on stone. The main requirements were that the beauty of calligraphy and painting be successfully reproduced in carving and that the stone be of good quality, so good that it could be used as an ink slab. The Chinese value Han dynasty stone carving more highly than Han dynasty bronze vessels and mirrors which exhibit excellent workmanship but contain little painting or calligraphy of the first order.

(b) ANIMAL FIGURES. The preoccupation with calligraphy and painting in stone carving, however, did not prevent the Chinese from producing some amazingly artistic stone figures. These were made as early as the Shang dynasty, as recent excavations reveal. In the Eastern Chou period (770-481 B.C.), the Chinese began to bury clay, stone, or metal figures in tombs. The practice became extensive in the Han dynasty. Among these figures, Chou stone animals and Han terracotta are exceptionally beautiful. The Chou style continued the monumental qualities of Shang dynasty bronze, retaining its pleasing proportion, keen sense of modeling, and massiveness. In addition, there is a new sense of energy, for animals, whether standing by themselves or grouped together, show extreme liveliness and tremendous vigor. Very often they are conventionalized in geometrical patterns, but even in geometrical regularity and in symbolic abstraction, they are alive and dynamic.

The Han style is especially good in its plastic sense. On top of this there is more pronounced rhythm and linear movement, and more dramatic expression of energy than in previous works. Group compositions are in general excellent, full of organic unity without sacrificing the freedom of movement of individual animals. Fighting animals represent the Han style at its best. Their forms, vitality, tension, and dramatic postures are unparalleled elsewhere.

This outburst of energy and the variety of forms in the Han figures were definitely due to a new source of inspiration. China was in contact with India and Persia and her art was therefore influenced to some extent by the art of those countries. The Bactrian types embodied in Hellenistic art came into China through northern India. As a result the Chinese developed a definite type of horse with exceptional nobility and energy. The Persian influence resulted in the winged lions of Liang (502-557 A.D.), which show tense energy and a wonderful sense of line. Later in the T'ang dynasty (618-907) when contact with Central Asia became more intimate, Central Asiatic horses and camels became objects of admiration by the Chinese and favorite themes of Chinese animal sculpture.

In the Northern and Southern Dynasties (420-589 A.D.), however, the Chinese spirit reasserted itself. Bodies of animals were prolonged and curves were exaggerated, indicating a return to the linear beauty of Chinese calligraphy and painting. This linear beauty was achieved without sacrificing the monumental characters of the figures, for they continued to be of enormous size, sometimes 12 ft long. Unfortunately it was this interest in size that developed many centuries later, in the Ming dynasty (1368-1644). Animal figures became massive. The trend was towards realism; the appreciation of linear beauty was slight.

(c) TOMB FIGURES. Tomb figures are of two types, huge figures erected outside tombs as guards and statuettes buried to serve the dead. Huge figures are of stone and are monumental and majestic in posture, but lacking in vitality. Small figures, on the other hand, are of pottery, and are full of vivacity and life. This is especially true of T'ang dynasty pottery figures which are considered the best of the kind. They are executed with feeling and with great care for details. They may represent warriors, servants, actors, magicians, musicians, and many others whose service may be needed by the deceased. Each figure has its own individuality and its own humor, be it a Persian magician, an Indian juggler, an Arabian horseman, a Central Asiatic camel driver, or a Chinese dancer. They are informal, intimate, and extremely characteristic. They are in an endless variety of posture, indicating a highly developed technique of modeling. Instead of being realistic human figures, however, they imitate the figures in T'ang dynasty painting, with long supple bodies, flowing draperies, and wide sleeves. The expression of linear rhythm is exceedingly effective. This is especially true of the dancing figures which are T'ang trerracotta at its best. Aside from the fact that they are beautiful, they exhibit an infinite variety of posture and movement.

(c) BUDDHIST SCULPTURE. While tomb statuettes are human, lively, and personal, Buddhist statues are impersonal, calm, and wanting in individuality. They lack variety of posture or modeling effect, because they are usually in the frontal position. Buddhists believe that a Buddha or a bodhisattva (future Buddha) is a universal being devoid of specific charac-

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

teristics. They have no desire, therefore, to represent a deity as male or female, or with any other individual characterization. Furthermore, they use images primarily for the purposes of worship and meditation, and consider the frontal position, together with the calm posture and merciful appearance of the statue, as most conducive to their religious experience. For these reasons they have almost totally ignored emotional expressions, organic features, and plastic treatment.

Buddhist sculpture must have begun in China as soon as Buddhism was introduced. In the Han dynasty, there were Buddhist images made of bronze, silver, gold, jade, sandal wood, ivory, and dried lacquer. There were large Buddha figures 20 ft. high. Also there were groups of 1,000 Buddha statuettes. In the fifth, sixth, and seventh centuries, Buddhist sculpture entered into a most glorious period. Many masterpieces were produced, notably in the Yunkang and Lungmen Caves.

The Yunkang Caves are situated in Tat'ung, Shansi province. The original work consists of five grottoes, which were started in 452 A.D. or later, and completed in 467. There are later additions, making a total of some twenty grottoes. Figures of Buddha and bodhisattvas are carved on the sides of caves in round form and tremendous size. Some of them are as high as 70 ft. The sculpturing of such large figures was undoubtedly facilitated by the regular shape of the caves.

It is certain that the sculpture of Yunkang is a result of the fusion of Chinese and foreign cultures. In the fifth century A.D., China was in constant contact with India and Central Asia. Stone carving in the round almost entirely eclipsed flat surface carving at this time. This fact might be explained as a gradual development of Chinese idol making before the arrival of Buddhism or as a sudden revival of Shang dynasty modeling in stone. But there is no doubt that the new movement drew its main inspiration from India and Central Asia. Chinese motifs are conspicuously absent in Yunkang. Evidence of Han art is found only in minor figures and in the treatment of draperies. The prominent nose and the thick lips make the Yunkang figures distinctly un-Chinese. In large figures, the style of the drapery is characteristically Indian. But we cannot conclude from this meager evidence that Yunkang sculpture is completely or even predominantly Indian. The nimbuses of the figures are pointed at the top, and hence different from the Indian style. There are also figures and hand signs not known to India at the time. Besides, there are unmistakable marks of Central Asiatic influence. A number of floral ornaments are definitely Iranian in origin. Hellenistic motifs are present in many figures. Undoubtedly both Indian and Central Asiatic influences were at work. Authentic records show that Indian and Central Asiatic artists arrived in China at that time. The work at Yunkang may have been produced by these foreign artists. Or it may have been the creation of Chinese artists who either consulted these foreign artists or worked entirely on the authority of Buddhist texts. The scarcity of inscriptions in these caves leaves us very little literary record to support either conclusion. At any rate, one point is sure: along with the obvious elements of Indian and Central Asiatic influence, there is the unmistakable presence of the Chinese spirit. This spirit is expressed first in the energy and tension of the figures characteristic of the preceding Han dynasty. It is also expressed in the rhythmic lines and elongated forms that are definitely Chinese in feeling and style. Furthermore, there is pleasing harmony of decoration and sculpturing, a harmony which could hardly have been achieved without the graphic and plastic arts of Han as foundation.

When the Wei capital was moved to Loyang in present Honan province in 494 A.D., the center of Chinese sculpture shifted from Yunkang to Lungmen in the same province. Here the figures are smaller, due chiefly to the irregular contour of the caves. There are many styles not found in India, and many Indian styles not found here. While the most important pieces are products of Wei (386-535 A.D.) and the earliest sculptured image dates back to 483, the majority of the figures belong to T'ang and some to Sung (960-1279). In general, the works exhibit a finer technique than those in Yunkang, are executed in better material and freer spirit. In both Yunkang and Lungmen, fifth century sculpture is dominated by foreign models. At that time the approach to Buddhist art was abstract. Wei artists were intensely interested in the spiritual meaning of Buddhism, so that Buddha and bodhisattvas are represented as aloof and somewhat ascetic. In the later works in Lungmen, however, there is increasing softness and mellowness. The body becomes more slender and the neck lengthened. Drapery appears more graceful and flowing. There is more sheer delight in the display of rhythm and refinement. This is also true of Sui (581-618) sculpture, although it still

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

retains the abstract quality of Wei to some degree. In T'ang sculpture, there is definite relaxation of energy. The spirit of artists became freer. Buddha figures became more human, more individual, more intimate, and more informal, so much so that there was the complaint that the Buddha was made to appear like court ladies. This change of style was due, first of all, to the gradual disappearance of Indian and Central Asiatic influence; secondly, to the revival of the humanistic spirit in the T'ang period; and thirdly, to the influence of painting. This last influence was destined to play a greater and greater role in Chinese sculpture. Under the influence of T'ang painting, sculpture became more pictorial, with the flowing line ascending in importance. Softer material like wood, clay, and dried lacquer came into vogue, and the chief interest of sculptors lay in subtlety, sophistication, charm, and rhythmic qualities. Color was used, partly due to the influence of painting and partly due to the weakening of the Buddhist impulse so that spiritual meaning was sacrificed in favor of superficial and easy decoration. By the Sung dynasty, interest in sculpture itself began to subside, owing, on the one hand, to the dominant position of painting and calligraphy over other arts, and, on the other, to the increasing popularity of Zen Buddhism which subordinated idol worship to the direct intuition of truth. Henceforth Buddhist sculptors were chiefly interested in making small figures of Kuan-yin, patriarchs, and *lohans* (saints). During the Yuan period (1280-1368) when Lamaism became the state religion, there was a revival of large-size figure sculpturing. The four Heavenly Kings on the gates of Chu Yung Pass are masterpieces of that period. In the Ming dynasty (1368-1644) many monumental figures were made in stone. The twelve stone human figures and the twenty-four animal figures, some measuring 12 ft. high, in front of the Ming Tombs are admirable for their magnificence and dignity. In the Ch'ing dynasty (1644-1911) there were also some remarkable achievements. The 70 ft. wooden Buddha of the Lama Temple in Peiping is an excellent example. So is the exquisite carving around the octagonal base of the White Pagoda Temple in Peiping. Nevertheless, from the Sung dynasty on, Buddhist sculpture was definitely overcome by painting. Chinese artists did maintain an interest in stone. The interest lay, however, not in sculpturing in the round, but in the engraving of calligraphy.

(d) ENGRAVING ON STONE. As has been pointed out, engraving on stone goes back to ancient times and reached a high level in the Han dynasty. To the marvellous accomplishments of Han, Buddhists of the fifth century added some remarkable tablets with calligraphy. The twenty inscriptions in the Lungmen Caves are among the most beautiful tablets ever produced in China. Rubbings of these tablets have been a constant source of inspiration to Chinese calligraphers. In the sixth century, not only inscriptions, but also Buddha figures were engraved on tablets.

However, the golden age of carving on tablets was not reached until the T'ang dynasty which gave China her most celebrated pieces of stone carving. These include many famous tablets which serve as excellent models of calligraphy. Of particular merit, however, is the portrait of Confucius painted by China's greatest painter Wu Tao-tzu and engraved on a tablet now standing in the Confucian Temple at Ch'ufu, the native place of Confucius. The Chinese attach special importance to this tablet because it most effectively expresses the personality of the sage who, according to his pupils, was "gentle but dignified, austere but not harsh, polite but completely at ease."

Equally admired are the six horses of Emperor Tai-tsung engraved on a stone 5 by 3 ft. The liveliness and the beautiful physique of the steeds are portrayed with perfect rhythmic vitality. The exquisite lines and elegant strokes compare favorably with the best in painting and calligraphy.

After the T'ang dynasty, Chinese carving developed along the lines of industrial arts and architectural decoration. Many beautiful objects of jade, lacquer, crystal, wood, ivory, etc. were produced. These, however, were works of artisans. Artists were not interested in these. Because of their primary interest in calligraphy, they developed a taste for a type of carving which is based on calligraphy. This is seal carving.

Seal carving may be traced to very ancient times. It was popular in the Han period when seals were carved of iron, jade, stone, and other materials. Its purpose was utilitarian and remained so in subsequent dynasties. Although pre-eminent artists of Sung like Mi Fei reproduced excellent calligraphy on seals, it was not until the Yuan dynasty (1280-1368) that purely aesthetic interest in them developed. In that period, painters like Ch'ien Hsuan and Chao Meng-fu successfully translated calligraphy onto seals. Later, artists

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

like Wen Ching-ming and T'ang Yin of Ming, and Teng Shih-ju (1743-1805), Pao Shih-ch'en (1775-1855), and Chao Chih-ch'ien (1829-1884) of Ch'ing were as expert in seal carving as they were in calligraphy and painting. Different schools arose, with differing emphasis on the straight line or the curved line, the delicate stroke or the rugged stroke, and on the different styles in which the scalpel is handled. There are thirteen styles of cutting, such as perpendicular cutting, reverse cutting, double cutting, abrupt cutting, "flying cutting," etc. There are also different styles of strokes such as "hanging needle," "willow leaves," "iron wire," etc., comparable to styles in calligraphy. All styles require that "the scalpel must be handled exactly as the brush should be handled," so that the beauty of calligraphy may be re-created in carving. Both bas-relief and incision are popular. As in painting, there are the "Six Canons" of seal carving, namely, rhythmic vitality and life movement, the vigorous and classical way of incision, well-balanced composition of individual characters and of groups of characters, authentic etymological basis of scripts, the handling of the scalpel in the manner of the brush, and the absence of the vulgarity of artisans. To a great extent these canons are but a different version of the Six Canons of painting. The main object is to achieve a harmony of fullness and strength, delicacy and power, heaviness and lightness of stroke, the classical (i.e., Han dynasty) style and individual taste, as well as the strange and the commonplace. In short, seal cutting is calligraphy transferred to stone. This is why it is called "the art of the iron brush."

Seals are made of jade, bronze, gold, silver, lead, precious stone, amber, crystal, horn, ivory, porcelain, incense, seeds, and even bamboo roots and melon stalks. They may consist of a name, a proverb, or a poetic quotation. Their ideal use is to inscribe or decorate a work of painting or calligraphy.

*Architecture.* Chinese architecture reached maturity much later than sculpture or painting. From vague literary records and a few bas-reliefs, we know that ancient structures were simple and crude. The Ming T'ang or the Hall of Brightness of the Earlier Chou dynasty (1122?-770 B.C.), the supreme achievement of architecture of that period, had multiple units and many murals, but was still quite primitive. In the following centuries there were magnificent buildings. The palaces of Ch'in, built in 212 B.C. with the labor of 700,000 men, had a compound two miles in extension. The terrace of their main hall was of such dimensions that 10,000 persons could be assembled in it and banners 50 ft high could be unfurled below. A palace of Han (206 B.C.-220 A.D.) was surrounded by a wall nine miles long and contained a main hall 500 ft wide. Its walls, railings, pillars, and beams were freely painted, elaborately carved, and richly inlaid with jade and gold. The palaces of Sui (581-618) were even more gorgeous. They required the labor of 2,000,000 people to complete. Their park measured 60 miles in perimeter and included an artificial lake with hand-made hills more than 100 ft. high. The main building, called Mi Lou (Labyrinth), had "1,000 gates and 10,000 doors," and was such a maze that it was "impossible to find one's way out even after a whole day's struggle." Forty "Detached Palaces" were scattered over the country. In the T'ang (618-907) and Sung (960-1279) periods, architectural styles were well advanced as may be seen in temples, pagodas, and palaces, referred to in literary records, represented in paintings, and preserved at the present day in the ancient Horyuji Temple (607 A.D.) in Japan.

Not until the Ming dynasty (1368-1644), however, did Chinese architecture reach its maturity. All types were fully developed, as can be seen from famous remains of this period, notably the Altar of Heaven, the ancestral temple of the Ming Tombs the Five Pagoda Temple, the Taoist temple Ta Kao Hsuan Tien, and the imperial palaces, all in or near Peiping. The main features and the different types of Chinese architecture were all perfected during the Ming era.

(a) OUTSTANDING FEATURES. Chinese buildings, as a rule, face south. This convention can be traced to the ancient Hall of Brightness. Research by Wang Chung (1744-1794) and Wang Kuo-wei (1877-1927) revealed that the Hall faced south, consisted of four buildings of five rooms each, and was surrounded by a square courtyard. The buildings were arranged in a central axis forming a Greek cross, and were used to house the emperor, to hold courts, and to conduct state worship, education, feasts, etc. The central space was covered with a round concave roof and was used as an audience hall. Many features of traditional architecture originated from this arrangement. It certainly accounts for the fact that all formal buildings in China are symmetrical, built on an axis, and generally broad and low..

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

The basic material of Chinese architecture is wood. In ancient times buildings were constructed with wood or bamboo patched with earth, or, in elaborate buildings, with pulverized shell. Only terraces were of mud and stone. It is true that in the Han period stone construction was used to some extent and many centuries later, in the Yuan and Ming dynasties, under the influence of Western Asiatic architecture, stone was used in terraces, railings, balustrades, gates, walls and in imported features like artificial fountains, secret chambers, stone pavilions, and bathing pools. But the main material of architecture throughout the ages has been wood.

Tiles have been employed for roofs from very early days. At present they are both glazed and unglazed, and are used in large buildings, while in some small houses the roof is thatched instead. But the most important members of a structure are the pillar, the beam, and the cornice on which the building depends for support, and these are of wood. This material is well suited to a style of structure that is broad and low. Its chief defect is that it does not last long. This, of course, is responsible for the regrettable fact that no Chinese building earlier than the eleventh century and few before the Ming dynasty have survived.

Perhaps the most striking feature of Chinese architecture is the roof. It has two concave converging hips culminating in a massive horizontal ridge and gracefully curving, gently projecting eaves supported by intricately carved or ornamented brackets. The roof is often glazed and colored. Its origin is lost in mystery, but from the bas-reliefs and clay models of the second century B.C., we learn that the sweeping roof was already in vogue at that time, although the curve was not pronounced until the T'ang period. The curved roof is intended not only to accentuate its own gracefulness, but also to harmonize the structure with the surrounding landscape. It contributes a great deal to the feeling of calmness, contentment, peace, gracefulness, and gentleness so distinctive of Chinese architecture.

Attempts have been made to explain the upturned roof by associating it with the tent, by describing it as an imitation of the contour of a tree or the flight of a sparrow, by tracing it to the bending of bamboo in ancient buildings, by ascribing it to the influence of Chinese calligraphy which takes special delight in the curve, by interpreting it as a way to permit generous reception of sunlight, or by simply considering it as a matter of necessity to re-enforce the trusses in order to lighten the pressure of the tiles. The tent theory is definitely untenable because the Chinese people have had no experience of tent life, and the calligraphy theory is an anachronism. Other explanations may have some measure of truth. The ultimate explanation, however lies in the Chinese love of the roof's rhythm and linear beauty. It also eliminates the feeling of mass and weight so offensive to Chinese taste. Herein one may find the explanation why neither the dome nor the arch has been used since the Han dynasty.

Roofs are either continuous from the ridge to the eaves or gable-ended on both sides of the building. In pre-T'ang structures and in North China today, they are highly restrained, but in South China and in informal pavilions throughout the country, they may be so sweeping as to resemble horns. Double and triple roofs are quite common. The center of the roof ridge is often crowned with a golden knob or fire pearl, while the two ends are profusely decorated with dragon designs. At the edge of the eaves there are often human and animal figures from six to 16 inches high. Their origin, their purpose, and sometimes even their iconography are uncertain, although they are generally believed to serve as guardians against evil spirits. The finial of the roof was usually a metal phoenix in the Han and T'ang periods and a Buddhist gold vase in Yuan, but is today generally a dragon or phoenix in porcelain or clay.

As to walls, they are often movable partitions and are secondary in importance. They are intended to fill in the space after the frame of the building is completed. The ceiling too, is secondary, and is usually omitted or false when present. Columns and beams, on the other hand, are primary structural elements. Columns are generally of *persea nanmu*, seldom of stone. Their usually huge size and their position are determined chiefly by artistic requirements. They are widely separated, do not support the entablature, seldom have capitals, but as a rule have brackets below the beams by which they are tied. Beams, columns, and in most cases trusses are exposed, for in the Chinese way of thinking, lines have a beauty of their own. They are often elaborately painted, gilded, or carved with conventionalized flower and scroll designs, historical scenes, or poetic representations in brilliant colors, especially gold, vermillion, and azure, with black and white as subordinates. The favorite design for deco-

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

rating columns is the dragon. That for the ceiling is the octagonal or round flower design, evidently a conventionalization of the Han dynasty square design of the water-lily painted in full bloom with its petals facing downward. In the walls, lattice-work plays a major role. This practice of rich decoration goes back to ancient times when murals beautified the Hall of Brightness and paper drawings covered pillars. In the Han period, even the earth floor was painted, until colored bricks were sufficiently developed towards the end of the dynasty. Aside from their artistic value, painting and gilding also helped to preserve the material.

The surrounding wall is another conspicuous feature of Chinese architecture, for no Chinese architectural unit, whether a palace or a temple, a city or a mansion, a park or a garden, can be considered complete without it. It dates back to the tenth century B.C. or even earlier. It was then, as it still is today, chiefly a matter of necessity—for protection. Nevertheless, it serves to give a structure an outline and unity. City walls, many of which are Ming remains, are high and thick and are generally of bricks. The Peiping city walls are about 60 ft. high, 40 ft. thick at the bottom and 20 ft. at the top, and consist of bricks 2 ft. by 6 in. and about 5 in. in thickness. Many city walls have bastions at regular intervals and watch towers at every corner, and often a moat all around. These walls are simple, symmetrical, majestic, and impressive. Walls surrounding buildings are usually painted or plastered, often in bright red, crowned with a roof of green glazed tiles, and richly decorated below the roof. In the case of an informal structure like the garden, the wall winds and zigzags, has irregular roofs and fancy doors, thus creating a sense of gentle rhythm. It is usually plastered in grey to serve as background for shadows of bamboo or some other shapely plant thrown upon it by moonlight. In such cases, the wall exists primarily for its aesthetic effect.

(b) PALACE STYLE. The foregoing features are common to practically all types of Chinese buildings, the palace, the temple, the dwelling house, the terrace, the pagoda, the pavilion, and the memorial arch. Especially, however, are they true of the first three types, which are often grouped together and called the "palace style." In structure and arrangement, the three do not vary radically from one another. They all follow the general pattern set by the Hall of Brightness. They consist of one or more buildings in a central axis, often with subsidiary buildings on both sides and in the back. Each building is usually one but sometimes two or three stories high, has from one to three halls connected with other parts of the structure by open courts and side corridors. To the back of the halls are living quarters. Additions are not built on top of the original structures but at the sides or in the back. Thus the symmetrical arrangement is preserved and expansion can be achieved without sacrificing unity. As a rule, the whole compound is enclosed by a wall, with the main gate in the south leading to an open court and the main entrance. This arrangement gives the impression of orderliness and peace, while the surrounding wall creates a sense of serenity and contentment.

In front of the entrance of the main building is a screen the use of which dates back to the Chou dynasty (1122?-249 B.C.). Originally it might have been erected to keep evil spirits from entering. Today, however, it is definitely for privacy and for weather protection, as the main door generally remains open during the day. Larger buildings are often accompanied by semi-artificial lakes or landscape gardens. The open courts themselves are in many cases gems of landscape architecture. These informal units help to minimize the simplicity and monotony of the general plan.

The foregoing description of the characteristic lay-out of Chinese architecture applies to both secular and religious buildings. From the days of the Hall of Brightness, religious and secular life in China has been a unity. Hence no distinction of the two types is necessary. The palace, the ancestral hall, the Buddhist temple, the Taoist temple, and the elaborate dwelling house have the same general appearance, differing chiefly in interior arrangement and in symbolism.

(c) T'ING. While buildings in the palace style are treated formally, the *t'ing* or the pavilion is treated informally. It is always an integral part of a landscape which is irregular in pattern. It may crown a hill of artistic outline, decorate a lake of interesting shape, or accompany a tree of strange contour. In it, all major features of Chinese architecture are present. The wall is often omitted, thus enhancing the importance of pillars, and the curved roof is often emphasized, thus accentuating the flow of linear rhythm. In or by the pavilion there are always artificial rockeries of picturesque pattern and strange charm.

(d) T'AI. The pavilion evolved out of the *t'ai* or tower, which is an ancient type going

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

back to 2,000 B.C. or earlier. Originally the *t'ai* was merely an earth mound or a stone terrace, used for worship, meteorological observation, military review, festivals, and enjoying animal or human entertainments. In the period of the Contending States (480-249 B.C.), some *t'ais* had nine flights of terraces, showing the advanced stage of the development of this particular type. Eventually it gave rise to the secular pavilion on the one hand and the religious altar and pagoda on the other.

Of all altars in China, the most famous is of course the Altar of Heaven outside Peiping. It is a raised platform of three circular terraces with elaborately carved railings and balustrades. Measurements are based on odd numbers, especially the number 9 which is symbolic of infinity. In the middle of a cypress grove and accompanied by the charming circular, three-roofed Temple of Heaven with sweeping eaves and a golden top, the Altar never fails to create an impression of serenity and to arouse a sense of awe.

(e) T'A. While the altar has remained essentially a religious structure, the paogda has been to some extent secularized. When the Buddhist *stupa* was introduced into China from India about the beginning of the Christian era, it combined with the Chinese *t'ai* and formed the *t'a* or pagoda. For Buddhists it serves to house some relic of the Buddha. A pagoda dedicated to a *lohan* (saint) has four stories; to a bodhisattva (future Buddha), seven stories; and to a Buddha, at least eight and usually thirteen stories. On top of the pagoda is a chain of nine wheels or discs, pointing towards the Abode of Bliss, Nirvana.

The pagoda is no longer confined to Buddhism. It is used in Chinese geomancy which claims that a pagoda can control cosmic forces. It is also used in courts and in gardens purely as ornament to landscape. Today there are hundreds of thousands of pagodas throughout China, the earliest one dating back to c. 523 A.D. They involve more variety and change than any other type of Chinese architecture. Many kinds of material are used—wood, stone, marble, bricks, and even "jade." The shape of the pagoda varies from a cone to an octagon. Its roof may be radically sweeping or rigidly restrained. Its colors may be rich and varied or merely grey. Its height ranges from several feet to 360. Most in favor is the narrow and tall pagoda with many roofs of colored glazed tiles and projecting eaves. Because of its linear beauty, it has been compared to a stroke in calligraphy.

(f) P'AI LOU. The *p'ai lou* or the memorial arch forms a class by itself. It is built of wood or stone, consisting of two or four posts covered by single, double, or triple curving saddle-roofs. The posts and brackets under the roofs are as a rule richly decorated. In the center of the facade there is a tablet or *p'ai* commemorating some person's meritorious deed. Whether it grew out of the ancient simple gateway or originated from the Indian *toran* (from which the Japanese *torii* may have sprung), is still an open question. Like the pavilion and the pagoda, it has the main characteristics of Chinese architecture.

(g) CONCLUSION. In going through the various types of Chinese architecture, one cannot help noticing the fact that aside from the pagoda, Chinese architecture has not been influenced by foreign styles as Chinese sculpture has. It has not been modified by Buddhism, Mohammedanism, or Christianity to any appreciable degree. On the contrary, the Mohammedan mosque has adopted the Chinese style in its exterior, and the Chinese Buddhist pagoda is now a far cry from the Indian prototype. This failure to benefit from foreign styles is due possibly to the conservatism in Chinese architecture, but probably to the lack of interest in architecture as such on the part of Chinese creative artists. Throughout the ages, the art of building has been left to artisans. There is no great name nor great treatise associated with this form of art. The famous *Ying-tsao Fa-shih* (Patterns of Architecture, 1103 A.D.) by Li Ming-chung, the *Ch'iao-to T'ien-kung* (The Skillful Art of Building, 1631) by Chi Ch'eng, and the *Kung-ch'eng Tso-fa Tse-li* (Regulations for Building Construction) of the Ch'ing dynasty (1644-1911) are records of details rather than aesthetic deliberations on architecture. There has been a notable lack of leadership in the art. Furthermore, the belief in geomancy and the regimentation by the government throughout the centuries have undoubtedly discouraged experiment. For these reasons, Chinese architecture has not developed to the same high level as Chinese painting and sculpture. This does not mean, however, that there has been no progress in Chinese architecture or that there has been no new development since the Sung dynasty, as some writers believe. During the Yuan period, both the coir thatched roof and the flat roof were tried. Ming architecture was much more complicated than that of earlier periods, and there was in it a sense of refinement and delicacy not found in earlier works. Carving and lacquer works

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

in Ming dynasty structures are the finest ever produced in China. In the Ch'ing dynasty the art of the glazed tile reached new heights. It was its golden age. There was a great variety of colors and shapes, and different kinds of clay were used. The Jehol Palace, the Yuan Ming Yuan, and the Summer Palace of the Ch'ing dynasty are constructions of supreme beauty.

There is no doubt that as more talent is directed to architecture, the art will soon enter into a new epoch. As a matter of fact, this new epoch is already at hand, for there has been an architectural renaissance in the last thirty years. In these recent decades, most governmental buildings, civic centers, memorial halls, libraries, museums, etc. have been built in the "palace style," complete with its sweeping roofs, glazed tiles in imperial yellow, lattice work, decorated beams and painted pillars, marble terraces and railings, movable partitions, and imposing gateways. Wood, however, has been replaced by steel and concrete, and modern lighting, heating, and ventilating systems have been introduced with ease. This does not mean that Chinese architecture will be replaced by Western architecture. In places where functional architecture is indispensable, China will readily bow to the West. But in places where edifices are to be monuments of art, China will, as she has in the last three decades, cling to the "palace style." Fortunately, Western scientific innovations can be incorporated into this style without sacrificing its main features. In no other case is the marriage of Western science and Chinese art so happy. If modern Chinese architecture can be taken as a pattern for the future development of other Chinese arts, there will be no conflict between Chinese and Western art in general but a synthesis of the two. This synthesis may take place not only in China alone. The West may take an interest in the curved roof, etc. as it has taken an interest in movable partitions. **Chinese fiddle.** See MUSICAL INSTRUMENTS.

**Chinese ink.** The traditional material of this name is made from a carbon black pigment, usually lamp black, combined with glue as a medium. In the Far East, this is regularly molded into sticks and the preparation of them has been given a great deal of care and attention. In use, the stick is rubbed with water on a stone slab, dissolving the glue and carrying the black pigment in suspension. An ink similar to this was the regular drawing and writing material in the West through the Middle Ages and the Renaissance.—G.L.S.

**chink.** *n.* A long narrow cleft, a crack, or crevice. *v.* To fill, as a chink.

**chinkinbori** (Jap.). A lacquer technique. Shallow engraving traced with gold. A technique derived from the Chinese.

**chinoiserie.** TERMINOLOGY: *"chinoiserie', "á la chinois", "la chinage"* were terms used in the 18th cent. in France and other countries to cover not merely the products of the European craftsman influenced or inspired by the art of China, Japan and the Indies but generally the original art of these countries as well as the European imitations. In more modern usage the term chinoiserie has come to mean European art influenced or inspired by East Asiatic art only. The English lexicons of the 17th and 18th cents. do not mention an equivalent for chinoiserie; the

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

term "china" for any kind of porcelain was first used in 1653. However, for the decorating of chintzes, furniture and especially lacquerwork the term "japanning" was used instead of chinoiserie. Similarly in the Dutch language, where the term "japon" for female dress and "kamerjapon" for informal apparel worn at home still testify to the 18th cent. fashion of printed cotton dresses with East Asiatic decor. In German the terms "sinesisch" and "indianisch" were used pretty much as synonyms for all East Asiatic art; for originals as well as for the European imitations. The Italians of the 18th cent. borrowed either the term "chinoserie" or used the expression "a la cinese" and in more modern times "influenza cinese".

*History and Contiguity.* The basis for the cultural and artistic relations between the Far East and Europe was trade; more specifically, silk trade along the old silk roads of which we have documentary and actual evidence (cf. Chinese damask of the Han period [202 B. C.—221 A. D.] found in Palmyra, Syria; excavations of Sir Aurel Stein in Central Asia). After the collapse of the Roman Empire and Hellenistic civilization it was the Islamic people who since the 7th cent. controlled the silk trade between the Far East and Europe. Chinese silk brocades of the 13th and 14th cents., some of them for the export to Islamic countries, have been found in the church treasures of western, central and northern Europe; their motifs of dragons, phoenix-like birds and lotus flowers were widely copied in Italy (Lucca and Venice) and amalgamated easily with the related motifs and the related dynamic style of the European Gothic. With the discovery of the direct sea route to East India (1498) a direct trade contact between the Far East and the West was again established which climaxed in the foundation of the East India Companies; English (1600), Dutch (1602) and French (1664). Especially the latter, the "Compagnie des Indies," was instrumental in flooding the European market with Far Eastern textiles, porcelain and lacquerwork. The second half of the 17th cent. and the first three quarters of the 18th mark the tidal wave of the chinoiserie. Before that time examples of Chinese and Japanese art had reached Europe as presents of legations sent from the Far East and as souvenirs of individual travelers (Marco Polo, 13th cent.). Knowledge of Chinese architecture, gardening, costumes and crafts was further disseminated through the engraved illustrations of the travel books of the Jesuits (cf. Athanasius Kirchner, 1667; I. B. du Halde, 1736).

In order to cut down on costs and, to arrive at a compromise between Far Eastern and European taste, workshops were established in Asia where natives decorated porcelain, textiles and lacquer after European designs and engravings (cf. the so-called "Jesuit Porcelain" with Chinese decor after European engravings; the "ateliers" established by the Compagnie des Indies in Pondicherry since 1680 for the decoration of Indian "chints").

Of greatest importance for the development of the European arts were the attempts of the European artists to emulate directly the Far Eastern art in gardening and landscape architecture, furniture and interior design, lacquer, ceramics, textiles, wallpaper and metalwork.

*Gardening and landscape architecture.* The outstanding books which inspired European gardening were: Father Attiret, *Account of the Emperor of China's Gardens near Peking,* trans. from the French, 1752; and Sir William Chambers, *Dissertation on Oriental Gardening,* 1772. The examples of still standing pavilions and "pagodas", and every building with a curved, overhanging roof was called so—in European parks and gardens are too numerous to be fully recorded. Best known examples are: Kew Gardens near London built by Chambers; Englischer Garten, Munich; Chinesischer Pavilion in the park of Sanssouci, Potsdam, designed by Frederick the Great and Buering; the "jardin Anglo-Chinois" near Petit Trianon, laid out by the English gardener, Richard, for Marie Antoinette; the pagoda in the park of the Duke de Choiseul and in Het Loo in Holland. The garden of the type "Anglo-Chinois" with its natural, irregular layout, bridges, cascades and pavilions represents an important element in European 18th cent. romanticism.

*Furniture and Interior Design.* The interest in eastern motifs was very strong in England where they appear in conjunction with those of the Gothic (Horace Walpole's Strawberry Hill leased in 1747) to blend also with those of the French rococo style. Of broadest influence was Thomas Chippendale's *The Gentleman and Cabinet Maker's Director* (first edition, 1754) which in many designs shows the synchronization and fusion of the 18th cent. "Gothic Survival," the French rococo and the Chinese.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

*Lacquer.* First original coromandel lacquers, whole folding screens and other smaller objects were directly imported from China and Japan through Indian ports (e.g., Frederick the Great presented a whole room of coromandel lacquer to his sister in Bayreuth). Later lacquerwork was produced in England, where "Japanning" was done by craftsmen and fashionable dilettantes and where the term soon became a synonym for veneering and polishing; in Germany (Stobwasser in Braunschweig); in Italy (Venice); and in France, where the great "ébénists" decorated such pieces as writing desks, commodes etc. in imitation of East Asiatic lacquer. The *sedan-chair* which following a Chinese custom became fashionable in European high society gave further ample opportunity for lacquer decoration in the Chinese style.

*Ceramics.* Earliest attempts to imitate the effect of blue-white Chinese porcelain were made in the so-called "Medici Porcelain" during the Renaissance. These imitations were, however, merely a kind of stone-ware. Rare original pieces of Chinese porcelain were occasionally mounted in silver and gold by European craftsmen since the 15th cent. During the 17th cent. Chinese motifs were more or less faithfully copied on European "faience"; Delft-ware, for instance. The collectors of the 17th cent. did not yet discriminate in the inventories between original Chinese porcelain and the European imitations in stone ware. This explains the high figure of so-called Chinese pieces in possession of Augustus the Strong of Saxony and Poland; a collection said to have numbered no less than 60,000 pieces and used for the decoration of the "Japanese Palace" in Dresden (built by Poepelmann).

Boettger's discovery of porcelain in 1709, which was before that date a carefully guarded Chinese secret—was in the next 50 years followed by the founding of numerous porcelain manufacturers, patronized and often run by the European potentates, large and small, worldly and ecclesiastic. Mention can be given only to the most important: in Germany —Meissen, (Dresden), Nymphenburg, Hoechst, Berlin; in Austria—Vienna; in France—Sèvres; in England—Bow, Chelsea, Derby and Worcester; in Italy—Venice and Capo-di-Monte at Naples; in Russia—St. Petersburg. The decoration followed either Chinese originals or were free inventions in a pseudo-Chinese style.

*Glass.* Chinoiserie motifs are very frequent in Bohemian and Silesian glass of the 18th cent., cut as well as decorated with gold and enamel.

*Textiles.* (a) *Silk Weavings.* A few silk weavings of Spanish colonial make with the Hapsburg double eagle, but of East Asiatic design, dating from the 16/17th cents. are known. The next group is that of "Bizarre Chinese" patterns found on Italian (Venice), French (Lyon) and Polish (Sluck) silk and gold brocades of the first part of the 18th cent. The bulk of silk weavings with chinoiserie are of an "illustrative", pictorial character, portraying "pagodas", dragon boats, Chinamen with pigtail, and bells, etc., mostly woven in Lyon during the second part of the 18th cent. (chief designers: Pillement and De La Salle).

(b) *Tapestries.* Chinoiserie motifs at the beginning are often mixed with Renaissance grotesque; for instance, in the designs by Bérain found in the products of Beauvais ca. 1700. This factory and Aubusson favored throughout the 18th cent. the chinoiserie. In English tapestries might be found "indo-Chinese" grotesques after coromandel lacquer (Design: John Vanderbanc).

(c) *Laces.* Chinoiserie motifs are very frequent in the laces of all countries since the second part of the 17th cent.

(d) *Chints.* (Chintzes). The Indian name for printed cotton weavings or calico, first imported from India, later (last quarter of 17th cent.) copied in the European countries, esp. England. In spite of rigid laws limiting or forbidding the importation and fabrication of chintzes, and even the wearing of such stuff in England as well as in France, the "Indienne" factories prospered, supplying not only material for clothing but also for the covering of walls and furniture. Most important among them was the Indienne factory of C. P. Oberkampf in Jouis en Josas near Versailles (founded 1760), who sent not only agents to the East to collect originai motifs but also employed the best French designers of chinoiserie.

*Wallpaper.* In England the combination of chintzes and wallpaper being done in the same factory was common. The oldest document of the wallpaper industry in England figures in a patent given by Charles I in 1643 to Jerome Lanyer of London to fabricate "Londo-Indiana". Since then East Asiatic motifs have been preferred for the decoration of wallpaper.

*Metalwork.* Chinoiserie motifs are common in the design of metalwork during the 18th

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

cent., esp. on wrought ironwork for elaborate gates and fences.

*Ornament print.* The chinoiserie motifs used in the different crafts during the 17/18 cents. were chiefly furnished by the so-called "ornament print" (Ornamentstich) in which the artists of France lead Europe. We mention here: Bérain, Gillot, Andran, Watteau, Boucher, Huquier, Peyrotte, Bellay, the elder Huet and especially I. Pillement (1709-1808) whose designs were used for textiles.

References to China and the chinoiserie in European literature during the 17th and 18th cents., either enthusiastically approving or satirizing, are numerous. See Voltaire (*Essai sur les moeurs; Orphelin de la Chine*); Defoe, Horace Walpole, Pope, Lamb, Goethe, Gozzi (*Re Turandote* transl. by Schiller). The influence of Confucius' moral philosophy and his stress on agriculture as the foundation of the state left its imprint on philosophic thought and economic theory (physiocrats in France.) See Allen, B. Sprague, *Tides in English Taste,* 1937. 2 vol., esp. chapters X-XIII; Belevitch-Stankevitch, H. *Le gout chinois en France au temps de Louis XIV,* 1910; Cordier, Henri, *La Chine en France au* 18. *siècle,* 1910; Graul, Richard, *Ostasiatische Kunst und ihr Einfluss auf Europa* 1906; Guèrin, M. J., *La Chinoiserie en Europe au* 18. *siècle, Exposition au Musée des Arts Decoratifs,* 1911; Laske, F., *Der Ostasiatische Einfluss auf die Baukunst des Abendlandes,* 1909; Reichwein, Adolf, *China und Europa, Geistige und Kuenstlerische Beziehungen im* 18. *Jahrhundert,* 1923; Scheyer, Ernst, *Chinoiserien in den Seidengeweben des* 17. *und* 18. *Jahrhunderts,* 1928. See FURNITURE. —E.S.

**chintz** (Hind. *chint;* Skt. *chitra,* spotted or variegated). Includes chittes, painted calicoes, pintadoes, toiles peintes, perses, and indiennes. A cotton printed with all over patterns; sometimes glazed or calendered. See chinoiserie. —G.W.R.

**Chios, school of.** One of the most productive and influential schools of sculpture during the 6th cent. B. C. was located on the island of Chios. It may have been a representative of this school who made the Nike of Delos, and it is likely that the kore type was invented there and exported to Athens, where it became so popular during the time of the tyrants. Pliny records the names of four generations of Chiot sculptors, beginning with Melas and ending with the sons of Achermos, who were considered the most famous masters of their time. Characteristic of the Chiot faces are the oval contours, thin eyes, and engaging smiles. In metal work the sculptors of Chios were also outstanding; Glaukos of Chios is credited with having invented the soldering of iron about 600 B. C., and was famous for his relief designs in metal. —W.R.A.

**chipap.** See sipapu.

**Chippendale.** See FURNITURE.

**chiriji (Jap.).** Plain black lacquer sprinkled with gold dust.

**chiton.** The universal Greek garment, worn by both men and women. There were two types: the Doric and Ionic, with slight differences in style for men and women. The Doric was an oblong woolen cloth wrapped around the body and sewn or left open on one side, sleeveless, and fastened at the shoulders with buckles or pins, with a belt over which the garment was pulled out. The woman's garment sometimes had an overfold (peplos). The Ionic chiton was longer and fulier, made usually of cotton or soft linen; it had sleeves fastened at intervals by brooches or pins, and was more richly decorated. Chitons were worn in a variety of colors and were ornamented with patterned borders. They were distinguished by their simplicity of material and design; they gave the maximum freedom of movement, and were effective in following rather than impeding the contours of the body. Hence they were of the utmost value to artists, both sculptors and vase painters, who used them to reveal and accentuate the dignity of bodies in repose, the rhythm of ones in motion. Greek sculptors were skillful in representing the delicate variations in fold patterns, without monotony or harshness. In comparison, the Roman treatment was usually mechanical and unimaginative. —W.R.A.

**ch'i yun sheng tung.** See CHINESE ARTS.

**Chod art.** See CZECHOSLOVAKIA, ART OF.

**choir.** *Arch.* That part of a church accommodating the singers; more generally, the arm of the cross between the transepts and the apse.

**choragic monument.** *Gr. arch.* A small commemorative shrine built by a successful choragus (chorus leader).

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

**choral notation.** See NOTATION.

**chord.** Simultaneous sounding of several (usually more than two) different tones; harmony (q.v.). Chords have different degrees of tension as a result of the different degrees of tension which their constituent intervals have (see consonance; tension). Apart from these factors, the degree of tension in chords is conditioned by the location of the constituent intervals in relation to each other and by the context in which chords appear by virtue of their placement in the design, of voice leading, metrical situation, dynamics, etc. The term *chord* is sometimes reserved for chords built according to a particular principle; e.g., in intervals of thirds, of fourths, etc. —E.K.

**choreography** (Gr. *choreos-graphos*, dance-plan). At the time of its first use (ca. 1700), spelled choregraphy, it indicated the written pattern of dance steps, the notation of composed dances. It has come to mean, through the 18th and 19th cents., the actual composition, creation or design of dance movements comprising the structure of a ballet, irrespective of its ultimate graphic notation. See design; NOTATION. —L.K.

**chorovody.** The chorovody, or ballad-dances, form the most ancient group of Russian national dances. The dances of this class are closely interrelated and distinct from the other three fundamental groups, the trepak, kasatchy, and kamarienskaya. The chorovody are round dances, in which the dancers accompany themselves by singing ballads. A group of men and women move in a circle surrounding a solo dancer, usually a girl. The nature of the movement varies according to the content of the song, and may be definitely pantomimic or merely follow the general mood of the ballad. In either case, the motion approaches art dance in its expressive range and high technical level. —J.G.

**chou** (Ch.) Round wooden rod around which a mounted painting is rolled.

**chou shou** (Ch.) Ornamental ends of the rod around which a mounted painting is rolled.

**Christ and St. John.** Devotional image (q.v.) which represents Jesus' favorite disciple trustfully leaning his head against the body of the Lord who is seated beside him. The theme is an embodiment of the desire in contemporary mysticism to be enveloped in the protection of Christ as St. John was, or even to be in the latter's place. The subject is known only in the 14th cent. and in that region around the lake of Konstanz which was then the center of all mystical endeavor in central Europe. Its artistic formulation was brought about by the isolation of the central group from representations of the Last Supper. —R.B.

**chroma.** See COLOR.

**chromatic.** *Mus.* See idiom, B (4) and C.

**chromatic color.** See COLOR.

**chromatic notation.** See NOTATION.

**chromaticism.** See scales and modes.

**chromaticity.** See COLOR.

**chrome pigments.** The most common of these and the most important commercially is chrome yellow, a lead chromate, synthetically formed by precipitation. The tint can vary from a pale greenish hue to orange. In character the pigment is crystalline and is not entirely permanent to light. It began to be manufactured and used in the early years of the 19th cent. Chrome green is a mixture of this yellow pigment with Prussian blue. Chrome red, also a lead product, a basic lead chromate, is made by boiling a solution of potassium dichromate with white lead and a small amount of caustic soda. It is only moderately stable, being readily affected by sulphur gases, and has had little use as an artist's pigment. —G.L.S.

**chromo.** A chromolithograph.

**chrysanthemum.** See SYMBOLISM IN FAR EASTERN ART.

**chrysanthine notation.** See eastern chants.

**chryselephantine.** Several of the great cult statues in Greek temples of the 5th cent. B. C. were chryselephantine, i.e., made of ivory and gold. Notable among them were theAsklepios by Calamis, the Dionysus by Alcamenes and the Zeus at Olympia and Athena in the Parthenon at Athens by Phidias. The technique was probably imported from the Orient. In the Tomb of Tutankhamen in Egypt there are statuettes in which the flesh is ivory and the drapery and hair gold, and similar examples have been found in Mesopotamia and Crete. But Greeks made their cult statues on a tremendous scale. Phidias' standing figure of Athena was forty feet high, constructed on a framework of well-seasoned wood, the

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

drapery made of plates of gold riveted together, the flesh parts of ivory. His seated Zeus was nearly as high. Accessories of both figures were profusely decorated in relief. According to Quintilian, the impression of beauty which the Zeus gave seemed to add something to the revelation of religion, and Epictetus advised his disciples to see it before they died. Lacking adequate evidence for visualizing how these statues actually looked, we can at least surmise that the materials of which they were made, as well as the majestic forms, seen in the dim light within the cella of the temples, inspired awe and adoration in the worshippers. —W.R.A.

**chüan** (Ch.). The word for silk, the common medium for painting.

**chuan chou** (Ch.). A term applied to a standard style of mounting for paintings, when they are rolled on a round stick which is incorporated into the mounting at the bottom of the picture. —J.A.M.

**chūban** (Jap.). A term designating a woodblock print of medium size, vertical.

**chüeh** (Ch.). Sacrificial bronze vessel, three-legged, and with two extended lips for pouring.

**ch'ui-ying wen** (Ch.). Earthworm marks. A pattern sometimes seen in the glazed surfaces of pottery which simulate the tracks of an earthworm.

**chung** (Ch.). A clapperless bell with ornamental hanging device; a sacrificial bronze form.

**chün yao** (Ch.). Chinese pottery ware of the Sung dynasty. Heavy with thick opalescence glaze.

**Chumash art.** See California Indian art.

**churinga.** See AUSTRALIAN ABORIGINAL ART.

**churrigueresque** (Mex.). An organized decorative system with its own columnar order (see estipite), decorative vocabulary (see faldoncito) and compositional syntax; employed particularly for *retablos,* facades, doorways, etc. in the Valley of Mexico ca. 1740-ca. 1780. Inaugurated by the Sevillian Gerónimo Balbás in the *Altár de los Reyes* of the Cathedral of Mexico, 1718-1736. See MEXICAN ARCHITECTURE (Native); SPANISH ARCHITECTURE IN THE NEW WORLD. —J.McA.

**cibobe.** See sipapu.

**ciborium** (pl. ciboria, Med. Lat.). (1) A drinking cup, generally covered, from the Greek *kibōrion,* meaning cup-shaped seed pod of the Egyptian water lily (lotus); (2) a drinking cup made from or resembling this seed pod.

(3) *Art and Eccl.* (a) Any receptacle designed to hold the consecrated bread or wafers for the Eucharistic feast of the Christian Church, especially one shaped like a cup or chalice with a dome-shaped cover. (b) Any receptacle designed to form a depository for the vessels of the Eucharistic feast or other objects of sacred nature. Ciboria of this nature vary greatly in design, size, and materials used, ranging from elaborate designs in precious metals or marbles to small cupboards of simple workmanship and decoration set into a wall. Example, ciborium by Mino da Fiesole in Church of San Domencio, Siena. (c) *Early.* A fixed canopy of durable material, together with its supports, from which was suspended the receptacle containing the consecrated wafer of the Eucharist.

The name was soon transferred from the canopy to the receptacle itself, the canopy in the Western Church being called a baldachin (q.v.) or tabernacle. Much irregularity still persists, and the terms are often used as synonyms though incorrectly so. The use of the term ciborium has been further influenced by its early though mistaken connection with *cibus,* food. See EARLY CHRISTIAN ARCHITECTURE. —J.C.

**cicada design.** A spear-pointlike motive, resembling a conventionalized cicada (insect of the cicadidae family).

**cicerone** (It.). A sight-seeing guide.

**cicona.** See chaconne.

**cinnabar.** As the natural red sulphide of mercury, this is closely related to the artificially made pigment, vermilion. Cinnabar is an ore, somewhat duller in hue than the synthetic product. It was evidently known to ancient artists but may have been confused with the artificially made red lead. Pliny speaks of cinnabar as minium and the latter name became associated ultimately with the lead pigment. —G.L.S.

**cinnabar lacquer.** See tsuishu.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

**cinquecento.** Italian for five hundred, also abbreviation for *mil cinque cento* (1500). Therefore used in Italian chronology to designate the years whose numbers begin with 1500, that is the 16th cent., although this disregards the fact that the years 1500 and 1600 are the final years of the 14th and 15th cents. respectively.

In the arts the term cinquecento refers to the Italian styles of the High and Late Renaissance during the 16th cent. A. D. The term, however, designates a style quality rather than a time division, being particularly descriptive of the classic formalism of the first half of the 16th cent. and less appropriately applied to the latter half of the century when baroque (q.v.) elaboration, affection and stylization are clearly seen. This gives authority for including in the cinquecento artists such as Bramante and Leonardo da Vinci, though most of their work was done in the 15th cent.

The century is marked by the climax of the Renaissance in Rome, the decline of Florence as the leading center of activity and the rapid rise of Venice as the outstanding school of painting.

Individualism is a strong factor, particularly at the beginning of the century but there is a pronounced trend toward a more general style in which local schools are less easily discernible.

*Architecture.* The period begins with the maturity of the Italian Renaissance shown by the Roman work of Bramante (Donato Lazzari, 1444-1514), Baldassare Peruzzi (1480-1536) and Antonio San Gallo, the younger (1485-1546), and is marked by the complete understanding of classic form, both in mass and detail, as applied to 16th cent. requirements. Examples: *Cloister of Santa Maria della Pace* (finished 1504), *The Tempietto* (in courtyard of San Pietro in Montorio) (1502-1510), both by Bramante, *Palazzo Massimi* (1529) by Peruzzi and the *Palazzo Farnese* by San Gallo the younger (first two floors, 1517). In Venice and North Italy, designs show greater elaboration of surface treatment and materials. Examples: *Liberia Vecchia* (1536) by Jacopo Sansovino (Tatti), *Palazzo Grimini* (1549) by Michele Sanmicheli. A break with conservatism is seen in the brilliant designs of Michelangelo. Made chief architect of St. Peter's in 1546, his daring genius produced its choir, transepts and dome (model only), setting the style and scale of the finished building. His freedom in the use of established forms was both the symptom and the cause of the desire for innovation, which in its unorthodox use of structural motifs anticipates the dynamic and theatrical designs of the succeeding century. This trend was slowed by the restraint of Vignola (1507-1572) and Palladio (1518-1580); however, both men present a fine balance between Classic adaption and Baroque invention. Examples: *Il Gesu, Rome* (1568) (facade by della Porta, interior decoration 17th cent), *Villa Farnese at Caprarola* (ca. 1547), both by Vignola; *Villa Capra* (*Rotunda*), *Vicenza,* the *"Basilica"* (1549), *Vicenza, Il Redentore, Venice* (1576) by Palladio. The period closes with the completion of the dome of St. Peter's by Giacomo della Porta and D. Fontana in 1588 and the early work of Maderna and Rainaldi.

The century sees the full development of the Renaissance dome (that is, a domical vault resting upon a high cylindrical drum, supported by arches and pendentives, usually four in number and arranged upon a square plan), the use of the colossal order (a column or pilaster, extending through two or more stories) and an increasing emphasis upon group and site planning in which symmetrical balance is sought.

*Painting.* Cinquecento painting begins with the development of a formal, monumental design, which has been styled "the grand manner" and which seems to be an outgrowth of Florentine science combined with Umbrian space-composition. It is exemplified by the painting of Raphael (1483-1520) (*Stanza della Segnatura, Madonna di san Sisto*). Light and shade (chiaroscuro) as an aid to tonal qualities or dramatic effect rather than to the definition of form or atmospheric depth is emphasized by Leonardo (1452-1519) (*Cenacolo, Mona Lisa*) and Correggio (1489-1534) (*Holy Night, Jupiter and Io*). Paradoxically, with this increase of formal and monumental elements in design, the human figure becomes less impersonal and far more a denizen of this world. Parallels could be drawn with Greek art of the 4th cent. B.C. Mural decorations tend to transcend the limits defined by architecture. The sciences necessary to naturalistic representation are thoroughly understood and are used to create the illusion of a desired reality. (*"To create three dimensions where there are but two."* Leonardo da Vinci.) This characteristic anticipated in different manners by Mantegna, Perugino and Pinturicchio is seen in developed form in Raphael's Stanze (Vatican), the *Sistine Chapel ceiling* (*Vatican*) by Michelangelo

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

and the *dome of the Cathedral of Parma* by Correggio.

The most homogeneous school of painting is that of Venice. Due to preoccupation with form the central Italian schools, particularly Florence, did not take full advantage of tonal color, a quality peculiar to painting. Venice, with its eastern (Byzantine) heritage, made color a primary consideration. This accounts in a large measure for its preeminence in painting. Venetian characteristics, range, and merit of the cinquecento can be summed up in the life and work of Titian (Tiziano Vecelli, ca. 1477-1576). But three other painters equal or surpass him in certain limited phases; Giorgione (ca. 1478-1510) in subjectivism; Tintoretto (Jacobo Robusti 1518-1594) in emotional intensity and Veronese (Paolo Caliari, 1528-1588) in monumental decoration.

*Sculpture.* The century is so dominated by the work of Michelangelo Buonarroti (1475-1564) of Florence that all other efforts seem minor. This can be said in spite of the fact that his greater projects (*Tomb of Julius II, Rome* and the *Tombs of the Medici, Florence*) were never completed. His pronounced individualism, while conducive of a desire for massiveness on the part of imitators, is less typical of the century than the mannered elegance and stylizations of Jacopo Sansovino (1488-1570), *Bacchus;* Benvenuto Cellini (1500-1571), *Perseus* (Loggia di Lanyi, *Florence*) ; and Giovanni da Bologna (ca. 1524-1608), *Flying Mercury, Florence* and *Neptune Fountain, Bologna.*

In the cinquecento, scientific realism gives way to style and surface finish. The same general considerations that apply to both architecture and painting are equally applicable in the development of sculpture. See *Civilization of the Renaissance in Italy,* Jacob Burckhardt, 1909; *Renaissance in Italy,* J. A. Symonds, 1907-10; *History of Italian Painting,* F. J. Mather, Jr., 1923; *Handbook of Italian Renaissance Painting,* Lawrence Schmeckebier, 1938; *History of Sculpture,* Chase and Post, 1924; B. Jellicoe, 1925. —J.C.

**cinquefoil.** A form much used in Gothic tracery consisting of five arcs or foils separated by cusps.

**circulating exhibition.** See exhibition.

**circus** (L., from Gk. *kipos,* circle). (1) *Rom. antiq.* A structure composed of an oblong or elliptical area enclosed within rising tiers of seats for the exhibition of public spectacles of a sporting nature, particularly chariot and horse races; before the building of the Colosseum and other amphitheatres the circus also provided the setting for various military games and mimic battles, field sports, combats of animals and of animals with men. From this circumstance is derived the modern meaning of circus: a company of performers and animals, and the performances given by them. The circus existed from a very early period in Rome; at first simply an open space for such activities, seats for the spectators were introduced in the time of the kings; these were of timber and were frequently destroyed by fire. It was not until the 1st cent. A.D. that the circuses, by now primarily hippodromes, were built of stone or brick and took a definite architectonic form, though there was a Greek prototype in the *stadion* for the running of footraces Of the various circuses erected by the emperors within the city of Rome few traces remain, save that the shape of the Circus Agonalis of Domitian is preserved in the Piazza Navona. The most complete surviving example is the Circus of Maventius (311 A.D.) on the Via Appia, about two miles outside the city. This arena is 530 yds. in length, 86 in breadth. At the end nearest the Appian Way was a colonnade pierced with a monumental gateway over which was the loge of the exhibitor (*editor*); on either side were six *carceres* or barriers from which the chariots started. The ten rows of seats for the spectators, with accommodation for 18,000 run the full length of both sides of the arena and around the half circle at the far end, where there is a second triumphal gateway for the exit of the victors. Special boxes were provided for the emperor and for the judges. The arena is divided for about two-thirds of its length by a low wall embellished with statues and obelisks, the *spina,* and at either end of this barrier rise pedestals (*metae*) capped with three cones, goals around which the charioteers had to drive seven times to complete the hazardous three-mile course. The *spina* is placed at a slight angle to leave the entrance to the course from the

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

*carceres* wider than the exit; the colonnade containing the *carceres* was curved to place each chariot equidistant from the throat of the course on starting. The lowest tier of seats is raised and there is no protective moat separating arena from seats as there was in the later amphitheatres. The vaulted space below the seats formed a promenade in case of rain. Circuses were erected in various cities throughout the empire, of which traces remain at Orange, Tarragona, Anagnia and Istambul; there were timber circuses at Paris and Soissons. The magnificent baroque circus (*'Sferistereo'*) at Macerata (by Alcandri) was designed for the game called *pallone*. (2) An enclosed building with a permanent circular or elliptic arena surrounded by tiers of seats for equestrian, acrobatic and other performances, and acts by trained animals, common in the 19th cent., and still represented in Paris by the Cirque Médrano and the Cirque d' Hiver; the earliest of these modern circus buildings was erected in Blackfriars-Rd., London, about 1780. (3) A circular range of houses or buildings surrounding a public thoroughfare at the junction of several streets; the thoroughfare is hence often entitled by this name, as, Oxford Circus (1771), Piccadilly Circus, and others in London and Bath. —T.A.H.

**cire-perdue, cire perdue** (Fr.). A process of casting bronze statues, etc. in which the original figure is modeled in wax over a core, and wax flows out of the space between the core and the mould when heated by the hot metal which runs into its place. See METALWORK.

**cisele** (Fr. *ciseler*, to carve). Velvet showing a pattern of cut and uncut loops.

**citadel** (from Fr. *citadelle*, 1586, from It. *cittadella*, dim. of *citta or cittade*, from Lat. *civitatem*: literally, "little city"). The highest and most impregnable and commanding part of a fortified town, its walls containing the permanent buildings of the garrison; hence a citadel is a fortress rather than a castle, though sometimes used as a synonym for a fortress-castle. The term has been in use since the Middle Ages; by extension it is incorrectly applied to ancient strongholds, including the Gr. *akropolis* and the Lat. *arx*. In medieval times the citadel served as much to dominate as to protect its dependent town. Notable examples: Carcassonne, Aleppo, Cairo, the Alhambra, Badajoz, Burgos and Ludlow. —T.A.H.

**citadel-acropolis.** See acropolis.

**cittern.** See MUSICAL INSTRUMENTS.

**city hall, town hall.** The municipal building of a city or town containing the offices of the principal officials.

**city park.** Cee CIVIC PLANNING.

**city planning.** See CIVIC PLANNING.

**civic architecture.** The architecture of structures that house activities pertaining to common society, or perform public services. Capital buildings, city halls, law courts, and museums are typical examples.

**civic art.** See CIVIC PLANNING.

**civic center.** See CIVIC PLANNING.

**civic design.** See CIVIC PLANNING.

**CIVIC PLANNING** (incl. *TOWN PLANNING, CITY PLANNING, and REGIONAL PLANNING*). The art and science of designing for varied human uses large outdoor spaces is commonly known by the term "planning" preceded by a noun indicating the kind of area involved, as **site p.** or **subdivision p.** in the case of a district (usually residential) smaller than a municipality, **village p., parish p., town p.** or **city p.** if a whole municipality is involved, **regional p.** if a larger territory including several municipalities having problems in common but usually not coextensive with county or state political boundaries, is included, and **county p., state p.** or **national p.** if one of these entities is the subject of consideration. **Continental p.** and **world p.** have not been attempted up to the time of this writing—although there has been some international regional planning—but these will probably be a development of the future as a by-product of increasing international organization.

Because of the present active growth of concepts in this field no single term for the subject at large has thus far received general acceptance. In past usage the English-speaking world has not been unanimous. In the U.S.A. **city p.** has predominated, **town p.** being applied only to relatively small communities, while in Britain it has been customary to use **town p.** more broadly in reference to large as well as small municipalities. In both countries **regional p.** has been a comparatively new term and used by most writers in the restricted sense given above rather

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

than generically. **Land p.** has been used for inclusive purposes by some writers, but is not wholly satisfactory because it seems to imply the exclusion of bodies of water from consideration. **Civic art** has been used mainly with special emphasis on the architectural, landscape architectural and sculptural adornment of the community. **Civic design** is considered by many to be satisfactory as a generic term. **Civic planning** has been chosen as the heading of this article not because of any intrinsic superiority to the preceding term but because its resemblance to the traditional but inadequate **city p.** makes it more useful for reference needs.

Some of the boundaries of this field are well defined; others, where expansion is in active progress, are more vague. *Architecture* (q.v.) *landscape architecture* (q.v.) and *civil engineering* are commonly used in connection with planning enterprises, and in point of size or expense some projects of these three types exceed some of the fourth; but generally the contrast between the specialized character of the former and the more varied nature of the latter provides a ready means of distinction. On the other hand, while in the past **civic p.** has usually been concerned particularly with physical resources and arrangements there is now a marked tendenecy toward increasing attention to the relations between material and social conditions, having as a result the fading of sharp outlines separating planning from the social sciences.

The general purpose of civic planning may be broadly described as "the efficient adaptation of man's general environment to his needs". Practically all human acts are attempts at adaptation to needs, but most of them are concerned with the immediate rather than the general environment and are more or less impulsive in character—often far from well-considered and efficient. There has been considerable planning, but much of it has been ill-informed and short-sighted. For example, any decision as to the placing of a building may be said to be an instance of planning, and may serve the immediate purposes of the owner of the land, but if that site happens to be, because of special circumstances, the only suitable location for a highway, and consequently the building is later torn down, the placing of it there was short-sighted, wasteful, inefficient planning. When such mistakes occur in large numbers, as they are likely to in all communities where most of the planning is done only by private individuals, each in his own behalf, the expense becomes enormous. Few private citizens have enough information—and many have not enough altruism—to enable them to plan in the public interest. Therefore effective civic planning is usually done by specialists whose training, experience and careful study of the facts in each case enable them to use wise, impersonal judgment.

*RESOURCES PLANNING.* The most fundamental of all planning is that dealing with the major resources of mankind in earth, water, minerals, living matter, sunshine and air. Its problems are extremely complex, involving interrelationships among geology, geography, biology, and sociology in their broadest aspects.

Some geological conditions are within man's control in spite of their tremendous magnitude. Minerals are very important to his welfare in this machine age, and, once exhausted, they cannot be replaced. If he continues to use the limited available supply wastefully, the future consequences will be most serious. Reckless commercial practices are now depleting his heritage at a rapid rate. In many cases mines are so managed that future access to relatively poorer veins of metal or coal is permanently cut off for the sake of speedy exploitation of richer veins. Oil wells are drilled too near together because of rivalries between adjacent land owners, and the natural gas accompanying the oil, which in the public interest should be utilized at the same time, is often wantonly burned in order to make quicker profits from the oil. The speed of the process will cause much of the potential oil supply to become inaccessible in the future because of the premature release of gas pressure. Of course the insatiable demands of a war enormously aggravate these evils.

The facts of biology and of the interrelations between biology, geology, and meteorology are also of great importance to man. This is especially true of those involved in the **hydrologic cycle**—the perpetual circulation of water between earth and sky. If the earth is well clothed with vegetation a large part of the rainfall is absorbed usefully by the roots of the plants and then transpired slowly back to the atmosphere; or any of it which escapes this, is at least delayed in its journey to stream and sea so that no harmful erosion results; while if ground is bare, the water runs quickly down any slopes, forming ever-growing barren gullies, washing away precious top-soil which is sometimes deposited as troublesome silt in rivers and harbors, lowering the level of ground water, with con-

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

sequent drying up of supplies of water for drinking and other human uses, and often causing disastrous floods. Other sources of waste are the leaching or dissolving of valuable chemicals from bare topsoil, and the depletion of soils from excessive specialization on one crop.

Many individual owners need considerable guidance in the allocation of land to various uses. Areas of which people are trying to make a more intensive economic use than is warranted by the conditions, as, for instance, ground used for tillage which is too barren for good crops and so should be devoted to pasture or forest, are called **marginal** or **sub-marginal districts.**

The steepness of slopes, together with the amount of rainfall and the fertility or rockiness of the soil, should largely determine whether a given area can best be used for wood, grass, or tilled crops. If rainfall is scanty, even level areas should be left in sod, or serious wind erosion ("dust-bowl" conditions) will ensue. Sometimes a series of unusually wet years, coupled perhaps with unusual demand for agricultural products, has encouraged owners to plow land which later proves to be too dry for the purpose—even if **terracing**, or **contour plowing** (making furrows curve in level sweeps around hills instead of straight up and down hill which encourages erosion) is practiced—with immense loss as a result. **Over-grazing**—permitting excessive numbers of animals, especially the close-cropping sheep, to feed on pasture areas—has almost equal effects.

Forestry has its special problems arising from the slowness of trees in maturing, which tempts owners to sacrifice long-term advantage for the sake of immediate profit. The best practice is to cut trees only as they reach full size, leaving young ones to develop later, eliminating excessive underbrush and trash and, where needed, planting seedlings of preferred species. Such policies have long prevailed in Europe, but in North America a tradition of **clear-cutting** has been inherited from pioneer days when the virgin forest was considered by many as merely an impediment to the settlement of the country, and large wooded tracts have been denuded of all sizes of trees at a time, the debris being carelessly left making tinder for forest fires. These have destroyed any saplings which have sprung up and often the best parts of the soil itself, exposing great barren areas to erosion. The new growth which manages to survive is always inferior to the original wood. Communities which depend mainly upon the forest for employment of their inhabitants often become decadent or utterly abandoned "ghost towns" after the wood is cut.

Some owners voluntarily use good forestry methods but there is need for much education and some measure of public control over privately owned tracts, together with large additional purchases of land for public forests. Intelligent policy is especially urgent for woodlands on slopes draining into water supply reservoirs and into rivers which are important for water-power, irrigation, or navigation.

The control of floods caused by past mistakes in forestry calls for expert planning, as it involves intricate problems in the interrelationships of many natural and social factors. The most obvious remedy, the building of levees, is inadequate, and the most fundamental cure, the replacement of forests in the drainage basins upstream, is slow. The building of dams and the providing of reservoirs is expensive and often complicated by such problems as the removal of whole towns from the reservoir areas, but the benefits from the resulting flood control, navigation, irrigation, power, water supply, and recreation facilities usually make ample compensation. Swampy areas have sometimes been drained for the purpose of providing new agricultural land, or for mosquito control, and subsequently it has been discovered that they were more valuable for water storage purposes. Any radical change in natural conditions requires careful study from many standpoints to avoid such errors.

The discharge of untreated sewage and other waste matter into rivers and sea is a serious problem. A small amount of pollution in water is purified by oxidation but in too many cases the quantity is so great as to kill fish and other wild life and gravely to menace human health.

*INDUSTRIAL AND BUSINESS PLANNING.* Few of the materials taken from the earth are usable immediately in their raw condition. Good planning demands that any necessary processing be done with a minimum of effort. Manufacturing requires the combination of (1) at least one kind of material —usually several—, (2) labor, (3) power, and (4) shipping facilities. The less transportation is involved in bringing these elements together the greater the efficiency; so the problem of locating a given industry involves calculations of the comparative difficulties of procuring the different elements, together with such considerations as the availability and

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

cost of necessary land or floor space, opportunity for disposal of waste material, and adequacy of water supply.

Since many industries have similar requirements, they often find it advantageous to be grouped in districts where suitable facilities may be had. An opportunity for spur tracks, for instance, might attract a number of factories all of which have a similar need for shipment of their materials by rail. The more advantages in common there are the more this tendency toward segregation is accentuated. Manufacturers of related products find it mutually helpful to be in proximity.

This tendency often produces whole cities in which one kind of industry is so predominant that if business conditions in that specialty become depressed the community is much more seriously affected than if it were more diversified in its activities. Therefore extremes of specialization are not altogether advantageous.

Many manufacturing plants are very ugly in appearance, produce disagreeable smoke, smells, or noises, pollute streams with their discarded products, or poison the air with fumes which kill all vegetation in the vicinity. These evils may be unavoidable in some cases but many could be remedied with little expense, sometimes with financial advantage, as when chemical research shows how valuable by-products can be obtained from wastes. Industries necessarily obnoxious should not only be located at a distance from residential areas but also should be toward the leeward with reference to prevailing winds. The most efficiently managed factories are usually also the most attractive. The effect of pleasant conditions upon employees and prospective customers is becoming increasingly recognized by enlightened manufacturers as being of pecuniary as well as humanitarian value.

Much of what has just been said applies also to business, whose function is mainly the distribution of the products of industry. The advantages of segregation are obvious here too, facilitating comparison of prices and interchange of related goods and services. Usually there is a sharp separation between wholesale and retail activities, the former being advantageously associated with manufacturing, shipping and storage facilities, while the latter are commonly either grouped in large central shopping areas, with considerable segregation of similar goods and services, or dispersed among residential districts as small neighborhood centers of mixed types, or else placed beside heavily travelled highways in order to cater to motorists.

Offices for commercial administration, finance and miscellaneous other purposes are advantageously segregated also, sometimes near the wholesale business centers. Banks designed for the use of the general public usually are distributed like retail stores.

Public buildings serving essentially commercial functions, like a general post office or a custom house, should be in the commercial center of the city, and their efficiency should not be sacrificed for the sake of architectural ostentation. They, like all other structures, should be so designed as to function with a minimum of human effort, yet made as attractive as effective use permits. Beauty achieved at the expense of convenience awakens more annoyance than appreciation and so fails in its purpose.

Commercial premises are more likely to be aesthetically pleasing than manufacturing plants, partly because in most cases they have no stacks, condensers, and other such forms exposed to view and less waste material to be disposed of, and partly because they are to a greater extent in direct contact with their customers whose good impressions are of business value. But everything possible should be done to make both kinds of places more pleasant to the people who spend there so many hours of life.

*HOUSING.* Tastes differ greatly as to the amount and kind of residential space desired by different individuals, preferences ranging all the way from the solitude of the pioneer to the congestion of the apartment dweller. Most people however would probably agree fairly well upon a list of the characteristics of an ideal home, in spite of variation in their estimates of the comparative importance of the different items.

Such a list might include the following: (1) Healthfulness, with cleanliness, and abundant air, sunshine, beauty, and if possible some contact with nature. (2) Privacy, opportunity for restful sleep and a peaceful environment. (3) Easy access to educational, social, and creative opportunities. (4) Easy access to place of employment. (5) Convenience in use; ease and economy in maintenance. (6) Security of posession, at reasonable expenditure. (7) Protection against fire, disease and other dangers.

It is only too seldom that a home is to be found combining in large measure all these advantages. The city may furnish the first two only at high cost. A rural or suburban site

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

is likely to provide them inexpensively but may lack accessibility to work and society except at cost of tedious travel. Often there is a shortage of acceptable, moderately-priced housing accommodations of all types.

The poor are, of course, most seriously affected by this problem, often being forced to live in tenements which are over-crowded, delapidated fire-traps, lacking adequate plumbing, lighting, heating and ventilation and altogether unsanitary. Disease, vice and crime are especially rife in slum districts.

One line of attack upon these evils has been through **building regulations** passed by some legislative body requiring certain minimum standards of construction and sanitation. However, generally such rules can be applied only to a limited extent or not at all to structures already built at the time of adoption, hence many of the oldest and worst specimens of bad housing have escaped. It has been difficult to secure enactment and enforcement of adequate laws in the face of opposition on the part of landowners and others who profit by the continuance of the bad conditions.

**Zoning ordinances** (which will be described in more detail later) regulating uses and heights of buildings and the preservation of minimum surrounding open spaces, thus protecting the occupants' supply of light and air, also are only applicable to new structures in most localities, and often even then have not been stringent enough to accomplish much good to the slum dwellers.

A more effective remedy has been the formation of public or semi-public corporations which buy large tracts of land in slum districts, tear down or rebuild the miserable tenements and replace them with substantial, sanitary, pleasant dwellings having landscaped yards, playgrounds and nurseries for children and other attractive features or **amenities** with rents at considerably below commercial rates, often at less than cost.

Since these spacious developments usually accommodate fewer people than the congested arrangements they displace, this process, instead of relieving a shortage of housing, is likely to accentuate it. Many of the people removed from the old buildings tend to gravitate into some other slum, making it more crowded than before. Also there must be constant vigilance to prevent favoritism in the selection of families for subsidized dwellings, since people who are not genuinely needy often try to occupy them. Notwithstanding these drawbacks, most students of the subject agree that such **slum clearance** projects, although not a complete solution of the housing problem, are of much social value, since they do definitely get rid of many filthy old hulks which otherwise would disgrace the community many years, always finding some tenants wretched enough to seek their dubious shelter. If the worst slums are eliminated, even though some of their inhabitants do move to others, some progress has been made. Clearly, however, this policy needs to be supplemented with other measures, providing both desirable houses and means for using them.

One of these measures is the **decentralization** of industries—dispersing them among many small communities rather than **centralizing** them in the large cities. This enables people to live within short distances of their work in districts where the comparatively low value of land makes cheaper rents possible, crowded dwellings less likely and often permits the supplementing of family income through home gardening, either in individual back yards or in **allotments**—strips within community gardens. Yet in too many cases squalid conditions exist, especially near factories and mines, even in the country. Some industrialists have provided for their employees row upon row of poorly built, ugly tenements, all alike. Some have used their dual function of employer and landlord as a means of exploiting the workers. On the other hand, some have built well-designed villages with attractive architecture and landscaping, including home gardens and good economic conditions. Similar developments of various sizes and types, some large enough to be called **garden cities**, have been built by philanthropists, philanthropic foundations or corporations, cooperative societies or governmental agencies.

A fundamental cause of the housing problem is the high cost of building construction in comparison with the income of the people. Anything diminishing the former factor, such as prefabrication processes putting housebuilding increasingly on a mass-production basis, helps reduce the difficulties. Also new developments in cheap, rapid transportation tend to improve the situation by promoting the commuting of workers, thus giving them easier access to inexpensive home sites, and also encouraging individual home ownership which is by many considered desirable if financial and other circumstances permit.

However it seems unlikely that reduction of land and building costs will be enough to win the battle against bad housing unless an attack is also made from the other side—the raising of popular income. It is doubtful if

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

anything less than a great economic reform providing a substantial improvement in the distribution of wealth, together with an increase in the efficiency of education, stimulating people to use their available time and money more wisely, will suffice to actually eliminate wide-spread poverty and slums.

*PUBLIC LANDS AND BUILDINGS.* Even with excellent housing conditions there would not be sufficient space around urban and suburban dwellings to serve all the requirements of the inhabitants.

There is need for playgrounds, adapted in location, type and equipment to the various kinds of users. In large centers of population there is demand for athletic fields with elaborate provisions for seating and transporting great throngs of spectators.

Distinct from these arrangements connected with active play it is necessary to provide opportunities for quieter forms of outdoor enjoyment. **City parks** ranging in size from tiny plots at odd corners of streets to others occupying several blocks, usually more or less formal in design, make refreshing oases of green amidst the masonry. So-called **country parks** may be well within the congested part of a city yet perhaps be large enough for broad, informal landscape treatment, with public golf links, zoos, botanic gardens, and other spacious arrangements. It is particularly desirable that generous portions of the shores of rivers, lakes or the sea be kept open and developed for public use. Farther out from the population center may be still larger **reservations** (q.v.), **public forests** and **wild life sanctuaries** where natural conditions are encouraged, with few man-made features except roads, bridges, bridle paths, foot-trails, picnic facilities and shelters. Some very large reservations have cabins which are rented for brief periods to campers at nominal charge. It is desirable that as many as possible of the parks of a community be connected by **parkways** or **boulevards**—elongated parks enclosing highways usually limited in use to pleasure vehicles, the former usually informal in design, the latter formal—the whole comprising a **park system** in which one may walk or ride for long distances with beauty on every side. Planners aim to have some ramification of such a system within short walking distance of every city home.

Many of them also advocate that where possible a broad **green belt** of land surrounding each municipality be reserved for park, forest or agricultural use, through public purchase, zoning or other means, to provide spaces for the enjoyment of nature, for community gardens, and to keep the town from spreading shapelessly over the countryside, losing its identity and community spirit by merging with neighboring centers, and growing too large for the citizens to keep in close touch with their local government.

Often park functions can be combined to advantage with other uses. The parkways and boulevards just mentioned often provide important and pleasant traffic routes approaching or passing through a city. Cemeteries, especially if their monuments are not too obtrusive, the grounds around hospitals, colleges, and other large institutions, and those protecting drinking-water reservoirs, furnish agreeable landscapes for the enjoyment of passers-by and therefore blend well into a park system even though in some cases the public may not be permitted unrestricted entry.

However, care should be taken not to make incompatible combinations. A playground, for instance, may be adjacent to a park, provided there is considerable foliage or other insulation between them, but if the two are not well separated the noisy activity of the former will rob the latter of much of its value as a place of more quiet enjoyment. A park is often in danger of encroachment or even annihilation due to misguided civic leaders who look jealously upon its open spaces as sites immediately available without cost for public playgrounds, buildings, or other developments.

Frequently land least useful for other purposes because of irregular, rocky or swampy topography, and therefore comparatively inexpensive, is admirably suited for parks. There is great advantage in buying large tracts of such land as early as possible, before it is really required for use, and holding it for gradual refinement as need for it develops. The loss to the community in taxes by this policy is negligible in comparison with the savings effected in the cost of the land and the gain from the increase in valuation of neighboring properties.

It is desirable in purchasing land for park purposes to secure if possible complete topographical units, such as both sides of a valley or all the shores of a lake, in order that incongruous private developments may not spoil the landscape effect. Also it is best when feasible to have the territory terminate at public roads rather than private rear yards, for the same reason.

The placement of public buildings depends considerably upon their functions. Some,

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

such as civic administration buildings, require a central location; others, like hospitals or pumping stations, may well be on the outskirts of a city. If their uses are compatible it is often desirable that they be grouped in **civic centers** where their combined architectural effect if well designed and with good landscaping around them may be impressive and an inspiration to the community. Some buildings may well be associated for reasons of convenience as well as aesthetics, as schools with libraries. Others should be separated, as police or fire stations from educational or recreational centers. Here, also, misguided efforts to economize sometimes lead to the crowding of a new building onto the grounds of an older structure, with unfortunate results. Consideration for the possibility of future expansion, as well as of the present appearance, demands ample open space around most public buildings.

**Squares** or **plazas,** important and enlarged street intersections, often closely related to civic centers, have been important throughout the history of civilization as focal points of community life, where marketing and all kinds of political and social gatherings have taken place. In many towns and cities much effort has been expended on their adornment with fountains, sculpture, arcades, and other decoration. In some old villages, a well or fountain in the market-place is still the principal water supply for the local population. In some other parts of the world it is customary to have a grassy, partially tree-shaded **village green** or **common** nearby, serving as a park, playground and site for local festivities and meetings, faced by churches and other public or commercial buildings.

Many old-world squares, dating from medieval times, when even main streets were usually irregular and very narrow, give an effect of practically complete enclosure and intimate unity. The beholder's eye is attracted by the picturesque facades of the surrounding ancient buildings and is not tempted to rove outside. In contrast to this, squares formed by intersections of modern wide streets impress with their spaciousness and distant views. Much as we may regret the loss of the charming older art-form, it appears inevitable under present conditions and the best available policy would seem to be to take as much aesthetic advantage as possible of the **closed vista,** or view terminating at a center of interest such as an impressive building.

Another modern problem arises from the increasingly urgent need for parking spaces for vehicles. There is strong temptation to use squares excessively for this need. A better plan is to provide if possible other near-by areas expressly for the purpose—**off-street parking.** Sometimes neighboring streets not needed for very active use are designated especially for parking.

*STREETS.* Clearly it is necessary that adequate provision be made for the movements of people and goods between the different parts of a city or region—especially between squares and other focal points. The natural pattern for the main streets of a town to take is in general likely to resemble somewhat that of a spider's web, with some streets radiating from the center and others circumferential. Large cities have several centers. A free adaptation of this spontaneous type of layout to the local situation is more likely to be convenient and economical than any rigid artificial design, rectangular or otherwise. The great increase in motor-driven vehicles and consequent traffic congestion has made it more important than ever that **arterial,** or **trunk** main connecting **highways** or **thoroughfares** be as direct and level as is feasible, and much wider than most of the principal roads of earlier days.

Augmented speed has brought added dangers of collision. These are lessened if the number of intersecting streets is reduced to a minimum, if acute angles in the intersections are avoided, if pedestrians are required to keep in special footways, and if vehicles having different directions and speeds are sorted into different **traffic lanes** or designated pathways, preferably separated by substantial curbs and **islands** (spaces in a street made slightly higher than the roadway to prevent their use by vehicles), or in some cases by wider strips of landscaped space, the shrubbery of which not only is pleasing in appearance but also serves to shield motorists' eyes from the glare of approaching head-lights. At a junction of several busy streets a **traffic circle** is often made, consisting of a large central island, usually landscaped, about which traffic rotates, all in the same direction. Where two especially important highways cross it is sometimes worth the expense to either raise one above the other, making an **overpass,** or lower one beneath the other, forming an **underpass;** in both cases traffic making a right or left turn is accommodated by a system of curving ramps so designed that no car meets another going in the opposite direction.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

The resemblance of the typical plan of these ramps to the shape of a four-leaved clover has led to the name **clover-leaf** being applied to both of these types of intersection. In especially congested parts of some large cities highways are superposed, forming **high level** or **double deck roads** or **streets**, but the expense of such structures is enormous.

As a main highway extends out from a city, too often it becomes a center of **ribbon development**, lined on both sides by disagreeable urban-type buildings and also excessive quantities of outdoor advertising and commercial establishments intended for the attraction of motorists. In order to escape from this, from the tedium of following behind slow-moving, noisy commercial vehicles, and from the delays and dangers of collision at numerous intersections, most drivers of private passenger vehicles prefer to approach or leave the city by way of a beautifully landscaped parkway where these unpleasant features are prohibited. Thus many parkways originally intended for the enjoyment of leisurely strollers and riders have since become busy thoroughfares, providing attractive entrances to the city, but not without some sacrifice.

**Abutters**—owners of property *abutting* or bordering—on an ordinary street have the right to build driveway connections at practically any point they choose along their boundaries. In some localities they are allowed even to connect side roads to the main street with little or no control from public authorities. Since the many intersections resulting are a troublesome menace to commercial as well as passenger long-distance traffic, and since the former is not permitted to avoid the difficulty by using parkways, a demand has arisen for **freeways, express,** or **limited access highways,** fenced off from adjacent land except at occasional well-controlled junctions, on which either passenger or freight vehicles can go at high speeds with comparative safety.

Modern trunk highways usually **by-pass** or avoid all the smaller towns near their routes, being connected with them only by well-marked side roads, hence have sometimes been called **townless highways.** This prevents the dangers and interruptions which come from mixing high-speed long-distance traffic with local, permits the liberal use of low-cost land for the broad highway, and saves the peaceful country villages from complete spoiling of their charm.

Increasing attention is being paid in many localities to preserving and improving roadside beauty. The islands and other odd pieces of land incidental to designing for modern traffic conditions give many new opportunities for landscape architecture.

**Secondary** or **sub-arterial streets** usually lack the extreme width and elaborate separation of lanes characteristic of main artertes, but should be at least wide enough to allow an easy flow of movement in both directions when both curbs are fully occupied with parked vehicles. Their chief function is to gather the traffic of local streets and pour it into the main highways at well-organized junctions.

Under present conditions the crossing of a busy thoroughfare is a formidable undertaking. To minimize the number of such crossings, it is well to plan the areas bounded by main or secondary streets, when largely residential, as somewhat independent **neighborhood units,** each with its local school, playground, park, branch library, retail stores and other community equipment, the shops usually on or near the bounding streets, the school and playground centrally located—off the main streets to lessen danger to children from traffic. A unit should be large enough to require its own elementary school, but small enough to enable all the children to walk to the building—which often may serve also as a local community health, educational and recreational center for adults as well as young people.

In a well-planned residential neighborhood the local streets are quite different from main or secondary streets in many respects. They are varied and economical in layout and width, each especially designed to fit the needs of its section so that a maximum of communication service can be obtained with a minimum of street area. A moderate amount of irregularity is advantageous since it not only gives opportunity for especially interesting aesthetic effects but also tends to deter the entrance of through traffic thus shielding the neighborhood from much bustle and danger. A U-shaped street or a **cul-de-sac** (pl. culs-de-sac) or **dead-end street** connecting with another street at only one end, is often an economical means of providing access to irregular pieces of land. These are highly esteemed by many people as residential sites because they have so little traffic. The latter should be short to avoid undue inconvenience and fire hazard, and should be wide enough at the far end to permit easy turning of vehicles.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

Streets should avoid climbing or cutting through steep hills directly but instead should wind around them, avoiding dangerous grades and providing attractive building sites and easy connections with private driveways. They should not be so far apart that excessively deep building lots are produced, since these may later, if the land increases considerably in value, lead to the construction of rear dwellings and development of bad housing conditions. Where feasible, streets should not run due east-west or north-south since those orientations give poor exposures to sunshine in many of the rooms of the houses.

Overhead electric wires along streets should be eliminated so far as possible by running them either under the surface of the street or else overhead along rear lot lines. Good shade trees add greatly to the attractiveness of a street, but modern waterproof pavements make it difficult for them to grow on curb-lines, so a common practice now is to plant them on private lawns near the street, by arrangement with the owners.

*RAIL, WATER AND AIR TRANSPORTATION.* Congestion often makes street travel slow. Cars moving on rails and separated from other traffic can make much faster progress. The form of separation ranges in cost from (1) the surface reservation, which is very inexpensive but rarely feasible under city condition; through (2) the **elevated** structure, ordinarily over a street, which is usually noisy and unsightly; (3) the **open cut**, where the railroad is below the level of its surroundings, relatively silent and inconspicuous, but requiring expensive excavation and monopolizing its space; and (4) the **subway, tube** or **underground**, so expensive that only large cities can afford it, (5) to the **tunnel** under a river, harbor, or hill which is the most costly of all such undertakings.

These **rapid-transit** lines need to be coordinated with all other passenger-transportation facilities in the city—particularly with airports, railroad stations and steamship piers. Any such point should be considered an entrance gate to the community, and so designed that strangers will receive a hospitable first impression.

Planning future provisions for air travel is especially difficult because requirements are subject to so much change on account of the progress of invention. However it is surely wise to provide ample landing areas, since if they later prove to be larger than necessary the surplus space can easily be used in other ways, and to choose locations of convenient relationship to other modes of transport, avoiding if possible places frequently shrouded in fog or smoke.

Railroad stations for freight or express should be separated from passenger stations but closely related to industrial and warehouse facilities, and provide means for efficient transfer of goods from one mode of transportation to another with minimum handling. Some large cities have been troubled by an excessive number of terminals belonging to rival railways; great improvement has come from combining these.

The necessity of avoiding steep inclinations and sharp curves in railroad design has caused many difficulties when new lines have passed through an established town, streets being intersected abruptly, necessitating in each case either a dead-end often coming at an awkward location, a **grade** or **level crossing** causing many accidents, or a bridge which is expensive. The smoke, dirt, noise and ugliness often produced by railroads are also troublesome. Electrification, which eliminates some of these evils, has been slow of development of its expense.

*THE MAKING AND EXECUTING OF PLANS.* The processes of making and executing civic plans consist essentially of four types of activity: (1) gathering of facts; (2) formulating of plans; (3) legislative adoption; and (4) construction and enforcement.

The first and second of these usually have been done under the direction of a **planning board, planning authority** or **planning commission** composed of representative citizens serving without pay, appointed by the executive of the governmental unit involved or elected by popular vote. Such boards should be small, of unquestionable disinterested honesty and ability, with fairly long, overlapping terms of office to insure continuity of policy. They usually have needed to employ part-time one or more specialists to advise them and attend to technical details.

The collection of adequate data as to the past, current, and probable future physical, economic and social geography of the area is most necessary before a plan can be prepared. Such information needs to be kept up-to-date by frequent supplementary surveys.

The designing process should be accompanied by public hearings and numerous conferences with civic leaders for the sake of both the fruitful suggestions often obtained and the need for a wide spreading of information as

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

a necessary condition of the popular support upon which a plan so largely depends for its success.

In some localities school children have aided, under careful supervision, in gathering information in preliminary surveys. This not only has saved expense but has also given the young future voters civic education of great value. The formation of an "advisory council" of perhaps 100 leading citizens of the area to form a connecting body between the planning board and the general population has proved helpful in many places. Chambers of commerce, women's clubs and other community organizations have often assisted or even initiated planning movements.

In a democracy, plans ordinarily must receive some kind of legislative approval before they become effective. This may be piece-meal in form—even though the plan itself may be **comprehensive**, or take into consideration all important planning problems of the district—as when money for construction according to different parts of a plan is appropriated from time to time as need for each project arises; or in some places there may be formal adoption of a **master plan** as a whole, under a law which requires future conformity to the plan except in specified circumstances. In any case there is ample provision for amendments. All civic plans must be revised from time to time as conditions change.

Detailed legal provisions for putting civic plans into effect vary considerably in different countries and states but there are certain fundamental principles in common. One of the central problems in planning law is the reconciliation of the sometimes conflicting interests and rights of the community and the individual. One basic assumption, known as the **police power**, is that a government has the right and duty to make and enforce any regulation necessary to protect the health, safety, and general welfare of the public, without making compensation to any individual injured thereby. Another, called the **right of eminent domain**, is that the government and certain public service corporations, such as railroad companies, have the right to force individuals to sell property which is demonstrated to the satisfaction of a court to be needed for public benefit, at a price considered by the court to be fair, after a disinterested expert appraisal.

One troublesome issue is the extent to which legal recognition can justly be extended to aesthetic considerations. It is possible to demonstrate that, for instance, the building of an extremely ugly structure depresses the value of surrounding property, but the lack of agreement among alleged authorities on aesthetics as to what constitutes ugliness has made legislators and jurists reluctant to consider the problem. In some countries **architectural control**, the requirement that designs of buildings be approved by an official board of architects before construction is permitted, has long been in use; in others this would be considered an invasion of personal liberty. Some governments which have not adopted such control of private buildings do go so far as to require approval by an **art commission**, composed of recognized connoisseurs, of any design for a public building or monument before it is accepted.

Another approach to this problem is by way of **restrictions** written into real estate deeds which, being contracts, can include almost any provisions upon which the two parties agree. Common types prohibit certain uses of the property likely to be considered objectionable by neighbors, prescribe certain minimum open spaces around buildings, and require that the latter must have at least a certain minimum cost. Thus indirectly, by utilizing obviously measurable characteristics, a slight degree of aesthetic protection can be obtained from the law. But since the enforcement of private contracts depends upon private litigation many offenses go unchallenged.

However some sins against beauty are also demonstrable sins against public health, safety and general welfare; and, as we have seen, the government itself has the obligation under the police power to prohibit them and to enforce its edicts effectively.

Among these edicts are **zoning ordinances**, or **zoning by-laws**, which are based on the theory that different types of districts or **zones** should in the public interest have different regulations as to uses of property and spaces around buildings. For example, a city might classify its territory into the following **use zones**, and prohibit in each the building of any new structures which do not conform in use to the types permitted in that district: (1) "Single residence" zone, for houses containing one family (or cooking unit) only. (2) "General residence" permitting the above uses plus two-family houses. (3) "Apartment" permitting the above uses plus multi-family dwellings. (4) "Business" or "Shopping", permitting the above uses plus retail stores, offices, public garages, etc. (5) "Light

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

industry", permitting the above uses plus wholesale ware-houses, etc. and factories which do not cause special danger to the public, or obnoxious smells or sounds. (6) "Heavy industry", permitting any use. There are many variations in different localties. Small towns usually adopt a simpler scheme, perhaps with only three types, residence, business and industry. In most localities **non-conforming uses**, or buildings of a type not permitted in a zone in which they were built before the zone was established, have been allowed to be maintained but not enlarged. An **incidental** or **accessory use** is one which although different from the principal uses of the zone is inconspicuous, not detrimental to them, and commonly associated with them, as for instance a physician's office in a residential district.

**Bulk zoning** regulates spaces around buildings, prescribing minimum sizes for yards or courts or a maximum percentage of lot coverage, and maximum heights. The latter through insistence upon a certain ratio between height and horizontal **set-back** (q.v.), also sometimes called **envelope restriction**, in order to let in sunlight around sky-scrapers, has had important influence upon the architectural effect of many large cities. Bulk zoning also provides a means, too often neglected, especially in the United States, whereby a proper adjustment of traffic volume to available capacity of streets and rapid transit lines can be maintained. The combination of **use zoning** and **bulk zoning** is called **comprehensive zoning.** An **interim zoning by-law** or **ordinance** is one adopted hastily for temporary protection during the preparation of a permanent one. Strictly speaking, however, no zoning scheme is ever permanent. It is expected that all regulations and plans will require occasional amendment as new conditions develop.

The enforcement of zoning is the duty of the local official who inspects building construction. There is always need for **variances** or exceptions to be made in some individual cases with unusual circumstances where a literal enforcement of regulations would be impossible or cause undue hardship. These cases are decided by a **board of appeals**—a small group of local officials—after a public hearing of which neighboring property-owners are especially notified. One serious problem is the tendency of many boards of appeal to grant variances when they are not actually necessary, thus robbing the community of much of the protection which zoning can provide. Another abuse is known as **spot zoning**, the making of small zones of inappropriate type for the advantage of particularly favored property owners. These, like other civic evils, can be prevented by informed and alert citizenship.

When a zoning plan is being designed there is usually agitation from over-optimistic land owners to make business and industrial areas far in excess of the probable needs of the community. If the planning board yields to this pressure the land in question loses much of its value for residential purposes, and since only a small proportion of it ever is actually sold for the other uses, a frequent result is the creation of a **blighted** district—a term applied to any tract where values are depressed so low that it becomes a liability instead of an asset to the community.

Wise zoning tends to prevent blighted districts by forbidding the building of structures which are incongruous in use or bulk, thus stabilizing and protecting real estate values, adding the weight of public authority to the natural tendency toward that segregation which, as we have seen, is usually so advantageous to all concerned.

The minimum widths of front yards or **setbacks** prescribed by bulk zoning sometimes may have the incidental effect of preventing building upon space which later may be used for widening the street. The procedure particularly designed for this purpose, however, is the establishment of a **building line**, under the right of eminent domain instead of the police power. The owner can claim compensation, but since he still enjoys the use of his land it is usually nominal.

An important problem connected with executing plans for streets is the control of **platting.** When an owner of a large piece of land desires to cut it up into building lots, forming a **subdivision** or **residential estate**, he is required in a well-organized community to first submit his plan or **plat** to the planning board, or in some localities to a small group of officials known as a **board of survey**, for approval before he may proceed with the work. In the latter case the board of survey should have some members in common with the planning board or at the very least the two boards should keep in close touch, in order that all new streets shall be laid out so as to be consistent with the community plan.

No plan is complete unless it includes a consideration of how the work shall be paid for. A comprehensive plan should contain a tentative schedule of execution providing for priority of the most urgent projects, and dis-

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

tributing the program over a term of years so that the community will not have too heavy a burden of work or expense at any one time. Also it is wise to have a **shelf** or collection of detailed construction plans held in reserve against future periods of business depression when the execution of public works will help to relieve unemployment.

A widely accepted general principle for financing public works is that the burden of expense should be distributed among the citizens in proportions to their ability to pay and to the benefit they derive from the improvement.

Benefit may be apportioned with reference to time by considering how long the effect of the work will last. Regular annual maintenance expenses should obviously be paid for from current taxes; it is argued by some, however, that bonds may justly be issued to pay for major permanent improvements so that future citizens will share the expense, since they will share the benefits. On the other hand, interest charges on bonds often add so much to the total cost of a project that many governments have concluded that a "pay-as-you-go" policy, applied to all but the largest enterprises, is best in the long run.

Benefits may also be apportioned with regard to space, by laying special assessments called **betterments** upon land owners whose properties are especially increased in value by a local improvement, such as the abutters on a newly-paved dead-end street.

Sometimes parcels of land forfeited by their owners for non-payment of taxes are suitable for civic purposes, and the municipality may wisely keep instead of selling them. Some governments have been able to secure large parks or other improvements with comparatively little expense to the public, by means of **excess condemnation**—purchasing or taking by eminent domain not only the land needed for the project itself but also considerable additional land in the vicinity which is later sold at a substantial profit due to the increase in value caused by the improvement. Furthermore, the possession of a liberal margin of extra land has facilitated the planning of good connections blending the new development into its environment.

This is a practical illustration of the measurable worth of civic planning; but much more important are the innumerable other values which, since they are in terms of human happiness and well-being, are beyond measurement.

*HISTORY.* It is difficult to say when civic planning began. Man has probably always been gregarious, and the first groupings of huts into approximate rows or rings for convenience or defense might justly be considered such a beginning.

In practically all ancient towns security was a prime consideration, so they were characteristically small, compact and enclosed in walls, through gates in which, comparatively broad, sometimes splendid, processional ways led to a central market-place used for all sorts of public gatherings and surrounded by many of the principal buildings of the community. Other important structures were sometimes grouped on a hill to form a citadel or "acropolis". The populace usually lived in crowded hovels reached by narrow, crooked alleys and courts. Some of these very early cities show regularity of street patterns. In India remains have been found of highly developed cities which were flourishing at least 5,000 years ago, built in rectangular blocks. Kahun in Egypt was laid out in straight lines between 3,000 and 2,500 B.C. to house workers for the construction of a pyramid. Other Egyptian examples of formal planning were at Thebes, Memphis and Tell-el-Amarna.

Babylon, Assur, Ninevah, Jerusalem and Palmyra were representatives of ancient splendor, the first noted especially for its terraced or "hanging" gardens, the last for its magnificent colonnaded avenue. Neither Athens nor Rome were highly organized in general structure but the Acropolis of the former and the forums of the latter were among the world's finest civic centers.

The first city planner of whom we know was Hippodamus of Miletus, 480 B.C., who had considerable influence, particularly in the building of Piraeus, Rhodes, and probably Selinus and Priene.

Although early Roman cities were often irregular in pattern, those of later periods show the influence of the military camp in their conventional rectangular layouts. A similar relationship occurred in China.

In the Middle Ages, although there were some towns called "bastides" planned on rectangular lines expressly to house workers on monastery lands, most communities were very irregular in pattern within elaborate fortifications. Often they had so much picturesque charm that some modern writers, notably Camille Sitte, have attempted to revive the style for their own time, with limited direct success but with some indirect influence upon

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

the development of the planned irregularity of the neighborhood unit.

The Renaissance, with its enthusiasm for the classical, brought a return to the emphasis on symmetry and the monumental. First in Italy, under the encouragement of various popes, then in France, especially under the patronage of Louis XIV and the influence of his architect, Le Nôtre, designer of Versailles, streets were widened and straightened and new ones cut through, often radiating from, and so affording vistas of, imposing buildings, which were fronted by spacious plazas with fountains and other embellishments. In Germany, Karlsruhe and Mannheim, and in Great Britain, Edinburgh and Bath were examples of this formal style as were also Sir Christopher Wren's unfortunately ignored plan for the rebuilding of London after the great fire of 1666, L'Enfant's plan for Washington, and later the development of the great boulevards, parks and plazas of Paris by Haussman under Napoleon III.

The 19th cent., with its unprecedented advances in science, invention, industry and transportation, was a period of fundamental civic changes. There was a marked increase of world population. Many of the people, lured by employment in the new factories even at very low wages, flocked to the cities, causing great expansion and the development of additional slums and other social distresses; others made use of improved travel facilities to emigrate to frontier territories or colonies.

In the United States the need for rapid subdivision of the vast western lands caused the adoption of a wholesale mode of surveying based on latitude and longitude which in turn led to the unfortunate imposition of a rigid, expensive and inconvenient rectangular street pattern, in the worst possible orientation, upon most of the country.

European cities tore down their out-grown and obsolete fortifications, and in some instances, notably Vienna, made good use of the space for circumferential streets and parks. Most old-world parks and playgrounds have been obtained from former royal pleasure grounds. Americans, with no such inheritance, have been stimulated into greater—although still inadequate—activity in purchasing recreation spaces.

Toward the end of the century the invention of steel framing and the elevator made possible the development in the United States of the skyscraper, a great architectural achievement, impressive when surrounded with sufficient space, but producing intolerable traffic congestion when closely grouped in quantity. Subsequent efforts to relieve the pressure by widening old streets or cutting through new ones and providing rapid transit lines have failed because owners profiting from the increase in land values due to the congestion have successfully resisted the enactment of adequate restrictions, and the building of new skyscrapers has outstripped the provision of new means of circulation.

Much of the demand for rapid transit has come from commuters living in **dormitory suburbs** who seek to combine the advantages of town and country life at the expense of a long ride to and from their daily work. Most large cities also have **satellite** industrial towns in their vicinity, arising from the desire of manufacturers to locate on cheap, abundant land but near a large supply of labor and good transportation facilities. (Some writers use the word *satellite* as a synonym of suburb.)

The publication in 1898 of a book, *Tomorrow,* by Ebenezer Howard, marked a milestone in civic planning progress. He proposed the purchase of large rural tracts by limited-dividend companies serving the public interest and the designing of them according to the best known principles of civic planning as attractive self-sustaining communities with provisions for well-balanced development of industries, local business and spacious, healthful housing, including ample open areas for recreation and a surrounding agricultural belt. His ideas have been embodied successfully in the garden cities of Letchworth and Welwyn, near London, and have had wide influence elsewhere.

The advent of the automobile early in the twentieth century brought along with its numerous social and economic benefits enormously increased congestion to already inadequate city streets, and spread the trouble into outlying towns and intervening country roads. The first remedy to be tried was the widening of existing ways, and many a beautiful tree-shaded village center was ruined before the concept of the "by-pass" came to the rescue. "Ribbon developments" wove cities and their suburbs and satellites together into great, indistinguishable, monotonously unattractive masses, unrelieved by open landscape.

The urgency of traffic problems greatly stimulated civic planning movements, which, however, had begun earlier—the decade between 1865 and 1875 having been particularly notable for the passage of European laws con-

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

trolling town extensions and public health, the Chicago World's Fair of 1893 having stimulated the development of many civic centers in the U.S.A., and modern zoning having begun in Germany in 1894. The year 1909 was an important one on both sides of the Atlantic: it marked the passage of the "British Housing, Town Planning, etc., Act", which, with subsequent amendments, has been the legal basis of recent official planning in that country; and in the United States it saw the first meeting of the National Conference on City Planning, the appointment of a Plan Commission in Chicago, a report on Public Improvements for the Metropolitan District of Boston, foreshadowing the later development of regional planning, the beginning of university instruction in planning, at Harvard, and the first thorough-going zoning of an entire American city at Los Angeles. The time was ripe for unprecedented activity.

The approval by the courts of the Los Angeles zoning encouraged other municipalities to follow suit, and soon a wave of enthusiasm for zoning swept over the United States. By 1929, 754 communities of various sizes had been zoned, and 650 had official planning boards. There was also considerable highway planning. **Superhighways**—extra wide arterial roads—with separated traffic lanes and clover-leaf intersections were extensively constructed. Much interest was aroused by the designing in 1929 of Radburn, New Jersey, a new suburb of New York with a novel layout featuring cul-de-sac streets, footpaths and abundant open spaces, so arranged as to effect a virtually complete separation of pedestrian and motor traffic. This experiment has had much influence upon subsequent planning thought.

In England, although some new broad highways have been built, the majority of the roads are much narrower than in the U.S.A. The process of planning has been so rigorously controlled by elaborate laws that local initiative has been hampered, in the opinion of some critics. However, Britain has been a leader in the building of new housing villages, excellent in their sanitation and spaciousness.

In continental Europe and Latin America there has been continued emphasis upon monumental effects with grand avenues and plazas. In several countries the laws permit a considerable degree of architectural control, which has greatly promoted civic attractiveness. Many European ports have surpassed those of the U.S.A. in combining beauty with efficient utility in the designing of their water-fronts, although the coördination of docks with railroads has not been so successful in most of the countries. An exception is Germany, where there has been excellent comprehensive planning, including zoning and industrial housing. Sweden, Holland, Czechoslovakia and Russia have also taken considerable progressive action in this field.

Among the cities on other parts of the earth for which more or less complete plans have been made are: Adelaide, Alexandria, Calcutta, Canton, Jerusalem, Johannesburg, Khartoum, Manila, Nanking, Greater Shanghai, Singapore, Tientsin, Tokyo, and Ottawa. Canberra, Australia, and New Delhi, India, have been planned from their beginnings, like Washington. This bare list indicates how the municipal planning impulse has spread throughout the civilized world.

The history of the neighborhood unit goes back at least as far as about 793 A.D., in Kyoto, Japan, but its modern form was first given prominent notice in the "Regional Plan of New York and its Environs", published in 1929.

This ten-volume report was admirably representative of the metropolitan type of regional planning, comprehensively dealing as it did with the planning problems common to New York City and its surroundings, a territory lying in three states, extending to a radius of 40 to 50 miles and including 494 municipalities. The advantages of a large city and its satellites considering together their water, sewer, park and other problems were first officially recognized in the United States in 1890, when in Boston were established boards which later were merged as the "Metropolitan District Commission". Other cities which have done **metropolitan planning** include Chicago, Cleveland, Los Angeles, Philadelphia, Santa Barbara, and Washington. There also has been considerable of it in France, Germany, Great Britain, Italy and Sweden.

Another type of regional planning has developed in England, having the special purpose of preserving the character of areas especially notable for historical or scenic interest.

A third and more common type is concerned with the general economic and social development of a natural geographic unit, frequently a drainage basin containing a large river with its tributaries. In Germany there have been several enterprises of this sort, the one for the Ruhr district, including at least 1,470 square miles and 268 municipalities, being especially important.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

By far the largest undertaking of this kind which has been done up to the time of writing is the Tennessee Valley project, including about 40,000 square miles of territory, comprising parts of seven states, and having among its purposes the development of navigation, flood control, electric power generation, reforestation, the proper use of submarginal lands and the "economic and social well-being" of the inhabitants. The work has been planned and executed under the supervision of three directors heading the "Tennessee Valley Authority", a corporation established by Congress.

The achievement of these ends is a most intricate problem, involving the stoppage of erosion by scientific agriculture and forestry; the building of great dams and power plants; the **resettlement** of the people who have been living in the reservoir areas above the dams, as well as others from sub-marginal farms, assisting them to move into well-planned new communities; sanitation, including the prevention of malaria through mosquito-control; the planning for new transportation, industrial, business, educational, recreational and social facilities; and numerous other factors. In short, such a project embraces practically the whole range of civic planning and of the relationships of human beings with each other and with nature.

The contemplation of such a stupendous task gives one pause. Yet when one reflects that man has succeeded before with many other difficult assignments, that he has the benefit of much experience with previous planning, and of a rich fund of scientific research, one feels reassured, and confident that not only will he accomplish this with a reasonable measure of success, but will boldly move on to still vaster undertakings—national, then continental, and ultimately world-wide, in their scope. Thus may planning—not dictatorial but always under democratic control—adjust man's environment to his needs and help him to achieve enduring peace, happiness and progress. C. —T.I.C.

**clair-de-lune** (F.). A color term applied to the glaze of Chinese pottery which simulates the light of the moon; a light blue.

**clair-obscure.** See chiaroscuro.

**clarinet, clarionet.** See MUSICAL INSTRUMENTS.

**clarity.** In criticism, the elemental meaning of this term is the simple one of transparency. Clarity indicates that a work yields its significance quickly and easily; it does not obtrude itself, as a work of art, between its meaning for appreciation and the person who would appreciate it. —I. J.

**classical style.** Although the art of classical Greece was actually extremely varied, including work which may be characterized as romantic, impressionistic, and realistic (see Hellenic Art and Hellenistic Art), certain of its most characteristic qualities, generally accepted since as "classical", have influenced strongly the art of Europe in various later periods. Broadly speaking, these qualities are: (1) the representation of the healthy human form at its best, without distortion or abstraction, tending toward the heroic but engaged in normal human activity; (2) a strict sense of formal design, monumental and typical rather than trivial and individual, appealing to the logical demands of the mind more than to merely sensuous delight or romantic moods. Copies or adaptations of such Greek art have been made in many later periods and places, but, capturing the external form, they have usually failed to incorporate the conviction and radiance of the originals. Genuine classical art, although it subordinated detail to contour and mass, did not suppress it, but infused into the powerful forms the subtlety and glow of resilient life. The adaptations have often only a superficial resemblance, with the negative virtue of restraint rather than the positive one of vitality. Roman artists thus failed to make their multitude of copies live. Among later sculptors, the craftsmen in Gandhara, India, fashioned adaptations of classical facial types and draperies, curbing their own native rhythmic exuberance. The influence of classical sculpture also appears in Provençal Roman-

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

esque statues, in which the earth-bound dignity was inspired by Roman figures. In the Renaissance, Donatello realized in his less individualistic and dramatic work a classical dignity of form, and in France, Goujon was instructed by the more gracious classical reliefs. Under the influence of the Beaux-Arts and the French Academy in Rome, France became devoted to the classical ideal, and the sculpture by such men as Girardon and Coysevox, and paintings by Poussin, Lorraine and David, dealt with classical subjects in classical types of composition. The development of archaeological research in the 9th cent. led to great enthusiasm for Greek and Roman art, which was reflected in sculpture of the neo-classic school, led by Canova, Thorwaldsen and Dannecker, who filled museums and homes with coldly formal mythological figures. In modern times a closer understanding of the best Greek work has been achieved, and sculptors like Manship, Jennewein and Cecere in America, Bourdelle and Maillol in France, and Milles in Sweden, have reinterpreted classical themes and techniques with vigor and originality, being genuinely guided rather than confined by the classical tradition. —W.R.A.

**classic ballet.** A style of the academic theatrical dance employing pure movements of the traditional school, apart from character (theatricalized folk) dancing, or associative or mimetic gesture. The impression of the body in movement or repose is essentially linear, with the line of the silhouette, clean, sustained and noble, brilliant but measured, deliberate but never dead. —L.K.

**classicism.** A style incorporating the characteristics of classical Greek or Roman art by a process of intellectual and aesthetic amalgamation. Many civilizations throughout history, from India to Scandinavia, have taken over elements of Mediterranean art, especially when in search of a rational, harmonious and human centered expression of their own cultural values. The term, then, in distinction to the genuine "classical", includes an element of the derivative—yet, although derivative, it appears with the claim of the absolute and timeless validity of classical art.

We thus may speak of an Alexandrian classicism, an Augustan classicism, a Renaissance classicism, a Palladian classicism, etc., thereby describing an art in which the national and time components are submerged in the pattern of Greek (or Greco-Roman) art. From this derives also, the peculiar quality of classicism whereby its formal timeless characteristics often differ from the time-bound meaning to be expressed such as, for instance, a modern stock exchange in the shape of a temple or Pauline Bonaparte as a reclining Venus.

It must remain to some extent unexplained why Greek art could exert such a recurrent and stimulating but also often sterilizing influence on other civilizations. Besides the highly rational organization of classical art resulting in clarity of proportions, rhythmical composition and visual application of geometrical and biological laws, Greek art had been the first comprehensive expression of a civilization of the white people handed down in visible signs to later generations. All these characteristics have bestowed upon it the qualities of the exemplary, the normative and the ideal.

Besides this general usage of the term "classicism" there is the specific and more frequent one applying the term to the neoclassical revival of the second part of the 18th and the first quarter of the 19th cents. This revival also is known under the name of "neo classicism"' (early part of it in America: "colonial style"), while certain periods of it in the history of furniture are called sometimes "Louis Seize style" (up to 1790), "Directoire" (ca. 1800), and "Empire" (ca. 1810).

Since the early Renaissance (ca. 1400), classical aesthetics have increasingly taken possession of Europe; yet all efforts toward a pure application of classical forms and principles have been counteracted to some extent by the dynamics of national and time-determined self-expression as a result of which finally, the "Baroque Style" emerges. The energies of this style had spent themselves by the middle of the 18th cent. The fact that it had become a means of propaganda for church and dynasty made it also suspicious in the eyes of the rising middle class brightened by the light of "Reason".

The excavations at Herculaneum (1738) and Pompeii (1748) provided the theorists, archeologists and academicians with the longed-for samples of classical forms. The appearance of J. F. Winckelmann's *History of the Art of the Ancients* (1764) furnished the literary-inclined world with the necessary foundations.

Thus by the middle of the 18th cent. the baroque style divided into its two original components—the classical and the Gothic. The latter created the strange Neo-Gothic revival, the former, classicism.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

Its stylistic characteristics are those of Greco-Roman art but presented with the sophisticated asceticism of a refined society which yearned for lost simplicity. White, gold, soft blues, greens and yellows expressed the delicate sensualism of the era in an architecture and painting still connected by many ties to the previous rococo. Under Napoleon I the early Hellenic type of classicism changed to the more pompous Roman style known as "Empire". The forms became heavier, and accordingly, the color preferred was a deep red contrasted with gold. The imperial era wished to suggest a revival of the Augustan era.

After Napoleon's downfall, classicism became more and more an archeologically correct costume disguising the utilitarian purposes of modern city life until by the middle of the 19th cent. it had given way to the more ornate pseudo-Gothic, Renaissance and Baroque which the uncreative era of style imitations had brought about. Nowhere has classicism shown itself more conservatively preserved than in the U.S.A. with its classicist capital, Washington.

ARCHITECTURE. The conflict between the baroque and the neo-classical current appeared first in *France* at the competition for the facade of St. Sulpice in Paris (finished 1745). Meissonier's elegant Rococo solution, was defeated by the classical design of the Italian Jean Nicolas Servandino (1695-1766). Jaques Germain Soufflot's (1713-1780) *St. Genevieve* (1755-1790), better known as "Pantheon", was the era's first church built in the Roman design as a centralized, thermae-like building. Angle-Jacques Gabriel (1698-1782), the architect of the Place de la Concorde and Barthélemy Vignon (1762-1828), the architect of the "Madeleine", combined the baroque genius for large-scale planning with the sobriety and the archeological spirit of the new era.

Pierre Francois Fontaine (1762-1853) and Charles Percier (1764-1838), the court architects and decorators of Napoleon, exerted by the publication of their designs (1811) an international influence in spreading the "Empire" style. As a lesser-known but highly typical expression, the "architecture of reason" of Claude Nicolas Ledoux (1736-1806) may be mentioned in which architecture is reduced to the basic geometrical shapes of the universe.

In England the Palladianism of the previous era turned to Vitruvian purification by the publication of Stuart and Revett's *Antiquities of Athens* (1761-62). Robert Adam (1728-1792) belongs among the most influential and refined architects of the period creating private homes (Sion House, 1761); city blocks and squares (the Adelphi, Fitzroy's, London); and public buildings (University of Edinburgh, 1788, only in parts); in which every detail of the interior and exterior is harmoniously designed.

James Craig (✠ 1795) designed a new *Edinburgh*, one of the few neo-classically laid out cities of Europe, while John Wood (✠ 1782) continued the noble style of his father, John the Elder (1754) in Bath. Equally important as a city planner is John Nash (1752-1835), the architect of Regent Street.

Sir John Soane's (1752-1837) Bank of England (since 1788) bespeaks still the Greco-Roman earlier manner, while Sir Robert Smirke's (1781-1867) British Museum (finished 1855) and Harvey L. Elmes (1813-1847) St. George's Hall in Liverpool (since (1838) represent the drier but archeologically more precise later phase of classicism.

In *Germany*, the new epoch excels in the "Prussian Classicism" of Friedrich Gilly (1772-1800) and his student, Karl Friedrich Schinkel (1781-1841), the architect of the Old Museum (1822-28) and the Schauspielhaus (1818-21) in Berlin.

Leo von Klenze (1784-1864), the architect of Ludwig I of Bavaria, transferred the Hellenic puritanism of the Gilly School to the South of Germany and to Russia (St. Petersburg, Eremitage—1840-52).

In *Italy*, the theatrical Roman, still half-baroque classicism of Giovanni Battista Piranesi (1720-1778) aroused a romantic longing among the architects of Europe to study the classical ruins.

Giuseppe Piermarini (1734-1808), the architect of the Scala (1776-78), Pietro Bianchi (1787-1849), the creator of San Francesco di Paola in Naples (finished 1831) and Pietro de Nobile (1774-1854) later city architect of Vienna, exemplify the new style in its different phases.

Scandinavia, Russia and Poland reveal in their cities and palaces, the great and lasting influence which the neo-classical style has had in the civilization of the late 18th and early 19th cents., continuing the large scale city planning of the previous baroque era on a more sober and conservative scale.

The first monumental architectural style of the U.S.A. is neo-classical. The so-called colonial style of the southern mansions as well as the architecture of New England, and

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

the Hellenism of Washington, all express the Attic, Roman, and French-steeped traditions of the new democracy. Thomas Jefferson (1743-1826) himself presents the unity of the new aesthetic and political ideals in his plans for Monticello (1771), the Richmond state capitol (1785), and the University of Virginia (1817).

Charles Bulfinch (1763-1844), Benjamin Latrobe (1764-1820), and Thomas Walter (1804-1887), have systematized and spread the neo-classical style all the way from Boston to Washington. Theirs was the last sound architecture of America in the 19th cent.

SCULPTURE. Theoretically, sculpture should have been the foremost expression of the classicist era since it is in the plastic field that Greco-Roman art has found its utmost expression. Rational art sensually experienced should have recognized in the human figure the noblest symbol of the universe. But practically the vitality of the fine arts in this epoch was too low, the experience of a humanism in the nude too remote to bring forth the expected sculpture. The two leading artists came from the southern and the northern ends of Europe; yet both spoke a very similar artistic language.

The Italian Antonio Canova (1757-1822) represents the realistic, often sweet and sensuous style of the first part of the classicist current with great skill and an equal mastering of the monumental (tomb for Clemens XIII—Rome, 1792; tomb of Maria Christina —Vienna, 1805) and the intimate (Amor and Psyche—c. 1795; Hebe—1814).

The Dane, Berthel Thorvaldsen (1770-1844) exemplifies perhaps best the Winckelmann ideal of "Noble simplicity and tranquil grandeur". Trained in Rome, he tried to reconquer the pure Greek style of Praxiteles. The classicist theory of the all-important contour (see PAINTING below) and the ever-present consciousness of his great examples prevented him, however, from achieving a vital plasticity. His Jason (1801), his basreliefs of Alexander's pageant (1811), his Christ (c. 1821) seem typical.

Other sculptors of significance are the English John Flaxman (1755-1826) (tomb of Nelson, St. Paul, London); the Frenchman Edmond Bouchardon (1698-1762) (Amor with the Club, Statue of Louis XV); and Jean Antoine Houdon (1741-1828)—only partially a classicist (countless portrait busts, Diana, 1780); and the German Johann Gotfried Schadow (1764-1850) (crown princess Luise and sister, 1797).

In general one can say that in subject matter, the erotical-allegorical type of the rococo has given way to a purer mythological genre, that religious sculpture nearly vanishes, and that portrait sculpture is stylized according to the ideals of Greco-Roman portraiture. Peaceful statecraft supersedes the vain-glory of war.

PAINTING. A revolution in painting took place at the same time under the leadership of theoretical writers such as Anton Rafael Mengs (1728-1779) and J. F. Winckelmann. The hostility of the theorists against the sensuous quality of color combined itself with a new emphasis on design as the solid foundation of the arts. This theory became further strengthened by Flaxman's and others' publications of Greek vase paintings in pure contour style which created the idea of Greek art being one of pure linearism. This tendency toward linear expression found universal acceptance.

Ingres states: "Even the smoke must be expressed by lines." The linearism of the classicist style appears as a part of a general reduction of the pictorial means in order to come closer to the believed clarity and serenity of ancient art.

As to subject matter, the heroique and the virtuous historical genre, such as Diderot (1713-1784) praised in his "Salon" reviews, became the favorite of the day.

The *Parnassus* (1761—Villa Albani, Rome) by Winckelmann's friend A. R. Mengs, was the first fresco in the new style. It exerted profound influence on the transitional masters such as Jean Baptiste Greuze (1725-1805) and Angelica Kauffmann (1741-1807). The new concepts of purified form and ideal subject matter concluded a treaty with the concepts of the French Revolution in the person of Jacques Louis David (1748-1825). This fact partially explains the enormous success of pictures such as his "Oath of the Horatii" (1784).

Yet, Republican Virtue became Imperial Grandeur in the "Coronation of Napoleon" (1805) and David, the sans culotte, became the court painter of the emperor. Besides his many historical paintings, David excelled as a realistic portraitist (Madame Recamier, 1800) and as the powerful leader of the best attended painting studio of Paris. His ideals were continued and translated from the Roman into a more refined Grecian sensualism by his student, Jean A. Dominique Ingres (1780-1867). He is the greatest portraitist of the era, its subtlest draftsman and the most un-

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

compromising adherent to classicist theorems. As such, his influence prevailed throughout the 19th cent. with the masters of the neo-classical style.

Thomas Couture (1815-1879), Theodore Chasseriau (1819-1856) and Puvis de Chavannes (1824-1898) expressed the classicist doctrines in paintings and murals. Yet they fought an increasingly difficult battle against the naturalistic tendencies of the 19th cent.

In the other countries the classicist period has not produced great painters; which bespeaks perhaps, a certain exhaustion in the creative impulse of the visual arts. Sir Josuah Reynold's (1723-1792) eclecticism adhered only in parts to the rigid purity of classicism, while the American-born president of the Academy, Sir Benjamin West (1738-1820) raised American and English historical painting to classicist standards. Exclusively as draughtsmen, the sculptor Flaxman and William Blake (1757-1827), the illustrator of his own poetical writings, conformed clearly and purely to the ideals of their era.

In Germany, the religious art of the so-called "Nazarenes" under the leadership of Peter Cornelius (1783-1867) and Friedrich Overbeck (1789-1869), represented a blend of Romantic ideas with classicist form. Their academic teachings have exerted a widespread influence in Central Europe, especially in the field of fresco painting. Anselm Feuerbach (1829-1889), a student of Couture and Hans von Marées (1837-1887), seeker for greatness of concept and form interpreted the classical ideal for their naturalistic contemporaries. They remained tragically isolated.

The 20th cent. has seen new inroads of classicism. Pablo Picasso's (born 1881) linearism of the 1920's and at present, the so-called Neo-Romantic movement contain elements of Flaxman's and Ingres' art. It is the abstract in form and the abstracted in subject matter which are sought for in present day classicism. See Lionello Venturi, *History of art criticism,* 1936; H. J. C. Grierson, *Classical and romantic,* 1923; Hans Rose, *Klassik als Kuenstlerische Denkform des Abendlandes,* 1938; Gustav Pauli, *Die Kunst des Klassizismus und der Romantik,* 1929; L. —A.N.

**classic revival period, in American art.** See POST-REVOLUTIONARY ARCHITECTURE AND DECORATIVE ARTS IN THE U.S.A.

**classification of the arts.** All arts fall into seven overlapping groups:

1. *Useful arts,* serving purposes outside themselves.
2. *Fine arts,* distinguished by self-sufficient expressive power.
3. *Lesser arts,* such as, furniture, rugs, printing, jewelry, masks.
4. *Decorative arts.*
5. *Social, civil, and religious arts*: graces, manners, ceremonies, rituals, and community plans which enrich human intercourse.
6. *Sportive arts,* pursued for pastime and amusement.
7. *Cosmic art,* not man-made, natural forms viewed as divine expressions.

The **fine arts** have been organized according to many principles, notably the following:

1. The senses: Hegel, Volkelt, Külpe, Delacroix . . .
2. Kinds of imagination (visual, auditory, fanciful) condition formative, tonal, mobile arts: Vischer.
3. Medium: Bosanquet, Meumann: shaping, speaking, musical, mobile arts; T. M. Greene: representational arts (sculpture, painting), abstract (architecture, dance, music), symbolic (literature).
4. Degree of ideality: Schelling, Hegel: in symbolic art phenomenon preponderates over idea (typically, Egyptian architecture); idea and matter attain equilibrium in classical art (Greek sculpture); idea dominates in romantic art (painting, music, poetry).
5. Organic activity: Santayana, Dewey: automatic and shaping arts: expression through the human organism or through external materials.

(Adler's system below includes six other principles.)

The two following schemes perhaps succeed best in displaying the range, interrelations, and differences of the fine arts.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

Adler, developing suggestions of Urries, constructs a cycle-system of the arts which integrates eight principles of division:

1. The use of external tools distinguishes mediate arts (architecture, sculpture, painting) from immediate arts (mimicry, music, poetry) which are expressed in the natural materials of man's organism and speech. Five other vertical perspectives qualify these contrasting groups respectively:
2. Formative versus musical.
3. Spatial versus temporal.
4. Static versus dynamic: rest versus motion.
5. Visual versus auditory (music, poetry), visual-auditory (drama, opera), and visual-rhythmic (dance).
6. Apollonian versus Dionysian.

By introducing fitting intermediate stages between neighboring pairs, Adler organized the six primary arts (in italics) into two cycles of kinship:

a. *Architecture,* monuments and architectural sculpture, *sculpture,* relief*, graphic arts, *painting,* murals and polychrome facades*, architecture. (*Means transition between two and three dimensions).
b. Dance, *mimicry,* drama, epic poetry, *poetry,* lyric poetry, vocal music, *music,* opera, dance.

Further, two horizontal perspectives intersect Adler's circles according to:

7. Theme of construction: body (sculpture, mimicry, drama); soul (architecture, music); world (body and soul; painting, dance, poetry).
8. Mode of expression: concrete-objective-imitative (sculpture, mimicry, painting, poetry); abstract-subjective-concrete (architecture, music).

Külpe divided the arts into three groups by senses (brackets enclose suggested supplements):

I. Optic arts:
  A. Surface arts:
    1. Uncolored or monochrome: Drawing [Graphic Arts, Photography];
    2. Polychrome: Painting, Tapestry [Stained Glass, Mosaic];
    [3. With motion: kinematic arts: Silent Cinema, Lumia, q.v.]
  B. Solid [or three-dimensional] arts:
    1. Semi-solid: Relief and Intaglio;
    2. Completely solid: Sculpture, [Ceramic Arts];
    [3. With motion; Pantomime, Eurhythmics, Fireworks].
  C. Aggregate arts: surface and plastic effects:
    1. Tectonic Arts;
    2. Architecture, [Monuments, Landscape Design, Interior Decoration, Flower Art].

II. Acoustic arts:
  A. Of tones: Music;
  B. Of words: Poetry, [all Literature, Speech Arts];
  C. Aggregate arts: of tones and words: Song, Melodrama (recitation with music).

III. Optic-acoustic arts [often with costumes and architectural settings]:
  A. Of gestures and tones: Choreographic Art (dance with music), [with words: Talking Cinema];
  B. Of gestures, words, scenery: Drama, [Puppetry],
  C. Of gestures, words, tones, scenery: [Pageants], Opera.

See Leo Adler, *Zeitschrift für Aesthetik,* XVI, 1922, p. 258-61; B. Bosanquet, *A History of Aesthetics,* 1892; Oswald Külpe, Univ. of Toronto, *Psych. Series, II,* 1907, p. 1-21; E. Meumann, *System der Aesthetik,* 1919.

—R.F.P.

**Claude Lorraine glass.** A small reflecting surface for use principally in landscape sketching, this probably was a common implement of the painter's studio during the 17th and 18th cents. It was not a silvered mirror but a piece of black convex glass in which the weak reflection reduced the large scene to a small area and eliminated much of the fine detail.

—G.L.S.

**clausula.** See MEDIEVAL MUSIC.

**clavichord.** See MUSICAL INSTRUMENTS.

**clavilux.** A light projection instrument with attached playing console invented by Thomas Wilfred, president of the Art Institute of Light, for the performance of silent visual compositions in lumia (q.v.). The instrument consists of a varying number of projection units, arranged before a flat white screen and controlled from a keyboard with sliding keys. Each manual of keys contains three sets for form, motion and color. A special notation system of numbers on vertical staffs permits the exact repetition of a composition. Registers, not unlike those on a pipe organ console, permit the coupling of one or more projection units to any of the manuals.

The projection units have different functions and at least four are needed but any number

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

may be added. The large permanent clavilux installed in the Art Institute of Light recital hall in New York City contains 32 individual units. In general a unit consists of a lamp house, a form section, a motion section, a color section and a final objective lens. The light passes from an incandescent lamp in the lamp house through condensing lenses and cooling cells into the form section. Here the formless white beam is shaped into one or more forms, motion is added in the motion section, color in the color section and the result projected on the screen through the objective lens—all modifications of the initial beam of light being under the control of the player at the keyboard. By the use of two or more units it is possible to create a visual counterpoint of independent form, motion and color sequences. See COLOR; LIGHT.

—T.W.

**clay.** Now largely the working material of sculptors, this material, varying widely in its composition, has had many uses in the arts. It is the substance of pottery and terra-cotta and, when colored by iron oxide and other minerals, has furnished pigments for painters. Under the name can be put any plastic earth consisting largely of hydrous aluminum silicate. Attributes of clay are its smoothness, its fine texture, and its rather unctuous quality when mixed with water. See CERAMICS I.

—G.L.S.

**Clazomene ware.** See Ionian vases.

**clean.** Used in literary criticism to indicate that a work contains only the features that are necessary to it for the performance of its artistic functions, with no additional parts or material that are added on gratuitously as simple decoration. —I.J.

**cleaning of paintings.** See RESTORATION OF PAINTINGS.

**clear-cutting.** See CIVIC PLANNING.

**clef** (L. *clavis*). A musical symbol that determines the pitch and note. At the present time three clefs are in use the G, or treble, the F, or bass, and the C clef. The earliest of these, the C clef, first came into use as marking the single line first placed in relation to the *neumes* (q.v.) as an indication of relative pitch. The F clef came into use shortly afterwards and the G clef had to wait until the 15th-16th cents. before it became part of the staff. The C line of the early staff was generally yellow or green while the F and G lines were red. This early G clef (gamma) now obsolete, was below middle C, for G was the lowest note of the musical system in vogue at the time. Hence the term "gamut" for g was called ut (gamma ut).

The C and F clefs commonly were used in Gregorian Chant, the F clef being used in connection with the Second Mode and sometimes the Fourth Mode. The fact that the half-tone was directly below these clefs was a distinct aid to the singer. These clefs were movable and were placed on various lines of the staff which lessened or obviated the use of leger lines. Gradually, the clefs took fixed positions for specific voices and instruments. The C clef on the first line (lowest) was used for the soprano voice or "fiddle"; placed on the third line from the bottom it was known as the alto clef or viola clef; in turn the fourth line C clef became the tenor clef or cello clef.

The present day clefs bear little resemblance to their original forms and the intermediate steps in their evolution show interesting features. The C clef for instance was turned around to prevent a conflict with a similar symbol, a time signature. The thickening of the top and bottom and a lightening of the side stroke approaches the present day symbol. The present G clef or treble clef (on the second line) was not introduced until the 15th-16th cent. In this instance the association of G with "sol" gave rise to Gs as the symbol. This may be seen in Playford's "Dancing Master". The F clef (on the fourth line) commonly known today as bass clef went through a more drastic series, the original showing little resemblance to the original. An intermediate period shows some resemblance to the C clef.

Sometimes in the course of a composition the clefs may be changed or placed on another line. The latter is often the case in some of the melismatic Gregorian Chant Graduals. In modern compositions the alto clef used by the viola changes to the treble clef to avoid leger lines; the F clef used for the cello part may change to the tenor clef for the same reason. In regards to the tenor voice of a vocal composition present practice uses the notes as written in treble clef to sound an octave lower. Some publishers use a C clef on the third space to denote the tenor voice. —J.V.H.

**clerestory, clearstory.** That part of a church roof which rises clear of the roofs over the aisle and ambulatory and which is pierced with windows to illuminate the interior.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

**cliché.** A stereotype plate or similar reproduction.

**cliff dwellings.** In the American Southwest: A term applied to designate the houses in the cliffs of the arid region, the former occupants of which belonged, at least in the main, to the group of tribes now known as the Pueblos. Two general classes of cliff-dwellings are recognized, (1) the cliffhouse proper, constructed of masonry, and (2) the cavate house, excavated in the cliffs. —J.M.M.

**climacus.** See Mass.

**climax.** *Mus.* Approach to a point of emphasis, sometimes the point itself. A phrase accent being a point of emphasis, each phrase contains a climax, if one of very small dimensions. Complex climaxes are the result of carefully planning the relations of consecutive phrase accents. The climax plan of a composition is an important factor in regard to the articulation of the form. —E.K.

**clipeus** (L. *clipeus*). Large, round shield of the Greeks and Romans; specifically, the round bronze shield of the Roman soldiers distinguished from their oval hide-covered wooden shield. —L.T.S.

**clivis.** See **neumes.**

**cloison.** A term used in connection with cloisonné enamel (q.v.). It designates an interstice formed by the minute strips of gold which are attached to the metal background of an enamel work. These cloisons are then filled with liquid enamel paint, before the plaque is put in the fire. —L.L.

**cloissoné enamel.** A particular technique in enamel work. It consisted in applying the design by attaching minute fences of gold to the metal plaque which formed the background and was generally of gold. The interstices or cloisons (q.v.) were then filled with vitreous pastes of various colors. This technique is the one used in enamels of Byzantine origin and differs from the so-called champlevé enamel (q.v.). See ENAMELLING ON METAL. —L.L.

**cloister.** See monastic architecture.

**closed vista.** See CIVIC PLANNING.

**cloth** (1) *Book.* All woven cover materials including vellum, buckram, and linen, etc. This modern form of cloth binding was introduced early in the 19th cent., but cloth bindings have been in use for centuries. (2) *Theatre.* The painted cloth drops in a theatre. (3) See TAPESTRY.

**clothes.** See COSTUME ART; DRESS, EUROPEAN.

**cloth of gold** (Fr. *drap d'or*). Plain weave of gold thread. It is usually a silk or linen thread entwined with narrow strips of animal membrane which has been coated with gold leaf. The Romans used cloth of gold (Pliny). It was imported to Europe by Crusaders. —G.W.R.

**cloth of Tarsus.** "Cloth of Tars couched with perles". *Chaucer.* Tarsus in south eastern Asia Minor specialized in this fabric. It was a fine silk usually dyed purple. —G.W.R.

**cloud band.** A ribbonlike motive of conventionalized cloud forms.

**clouds and mist landscapes.** See CHINESE ARTS.

**clover-leaf.** See CIVIC PLANNING.

**Cluniac architecture.** Understood as the Romanesque churches and conventual structures of an international system of priories and monasteries ruled from the reforming mother house at Cluny (Saône-et Loire, France), founded in 910 and suppressed in 1790. The sober earlier works and the monastery plans have a considerable uniformity. Great advances in building technique, scale, and sculptured decoration were made by the French Cluniacs in the 11th cent. without producing a stereotyped inter-regional style. The third church at Cluny (1088-1130 and later) was the largest, boldest, and most highly evolved Romanesque building, but it failed to be an influential building because Gothic architecture was invented before it was finished. See Oursel, C., *L'Art roman de Bourgogne,* 1982; Evans, J., *Romanesque Architecture of the Order of Cluny,* 1938. —K.J.C.

**coat-of-arms.** See HERALDRY.

**cobalt pigments.** Among the important additions to the artist's palette in the early years of the 19th cent. was cobalt blue, discovered by Thénard in 1802. It is a combination of the metals, cobalt and aluminum, is moderately fine in grain, bright in color, and very stable. Earlier blues were derived from cobalt, notably that which appeared in ceramic glazes, and a pigment of the late Renaissance known as smalt. These, however, did not carry the

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

same name. A green made also from the mineral, cobalt, combined in this case with zinc, is as stable as the blue, but has less strength as a color. Cobalt violet is an anhydrous cobalt phosphate or arsenate, or may be a mixture of the two. Its hue is reddish violet, it is weak in tinting strength, and rather transparent. Like the other cobalt pigments, it is stable and unaffected by most chemical reagents. Cobalt yellow, often called aureolin, is a chemical compound of cobalt with potassium. It has fairly good strength as a color and moderate hiding power. In date it is somewhat later than the other cobalt pigments, for it appeared on the market in 1861. —G.L.S.

**cobblestone.** A rounded water-worn stone, as for paving.

**cochineal.** One of the many pigments made from dyes, this, called also *carmine lake* and *crimson lake,* is made from the dried bodies of an insect which lives on cactus plants in Mexico and Central and South America. The dye is extracted and precipitated to form a pigment. On different bases it produces tints from scarlet to purple. It is not stable to light, though its fugitive character is less evident when it is used with an oil medium. —G.L.S.

**coda** (It. tail). An additional termination to a musical composition, ranging from a few chords to an elaborate part.

**codex.** *Book.* A MS. volume. In the olden times, waxed tables fastened together. Pl., *codices.*

**coelanaglyphic.** *Sculp.* Indicating hollow relief.

**coffer.** A sunk panel in a vault, dome, or ceiling. See FURNITURE.

**coherence.** As a critical standard, this indicates a high degree of integration between the various aspects and elements of a work. A coherent work is one in which all of the parts reflect meaning upon one another, and in which there is, consequently, an easy transition across the work through all its dimensions. —I.J.

**coign.** See quoin.

**coil method.** See terra cotta sculpture, direct method.

**coin.** See quoin.

**colascione.** See MUSICAL INSTRUMENTS.

**colcothar.** See Indian red.

**collage** (Fr. *collage,* a pasting, something pasted). A term now generally accepted as the designation of certain pictures or other visual arrangements, sometimes Dadaist, but usually Surrealist. These are made, in part or entirely, of pasted pieces of paper, newspaper, wallpaper, chromos, illustrations, photographs, and other textured or figured material, which are assembled in a manner totally incongruous with ordinary phenomenal experience.

Sometimes arrangements are made of fragments of such materials, plus somehow related, drawn, painted, or three-dimensional passages; sometimes painted or drawn passages are added to, or incorporated into photographs, illustrations, and the like; sometimes whole cut-out images are inserted into the midst of already existing pictorial compositions; sometimes (according to Aragon) "the photography, pure and simple, of an arrangement of objects made incomprehensible by photography". A further variety is the **titre poème** (lit. **title-poem**) or cut-out poem, in which patches of writing or lettering are pasted into image-arrangements such as those described above.

It is held that the forcefulness of collage as a mode of expression derives from the novel, often bizarre and altogether unexpected, juxtapositions of the previously unrelated images, fragments of images, and stuffs, and through the psychological impact of the associations and fantasies which they evoke. (". . . we would come by chance, or as it seemed by chance, on [for example] the pages of a catalogue containing plates for anatomical or physical demonstration and found that these provided contiguously figurative elements so mutually distant that the very absurdity of their collection produced in us a hallucinating succession of contradictory images, superimposed one upon another with the persistence and rapidity proper to amorous recollections. These images themselves brought forth a new plane in order to meet in a new unknown [the plane of non-suitability]." M. Ernst).

By the Surrealists, who began making them ca. 1920, collages are considered (1) as a means of release of the fantasies of the subconscious, without dulling or inhibiting the process through the technical and mechanical

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

restraints necessarily imposed by the more traditional methods of painting and sculpture; (2) as transforming the commonplace, the insignificant, and even the contemptible, without altering their appearance, through juxtaposition with other images and materials, a process somewhat akin to metaphor; (3) as eradicating personal taste, style, and technical virtuosity, which were considered to be self-advertising, thus inevitably diluting the stimulation-potentialities of the image by obtrusive indications of facture and the personality of the maker; (4) as providing a means of objectifying their fantasies and visions to persons untrained in the traditional artistic skills; (5) as another repudiation of the traditional artistic aims and conventions, which were considered to be moribund.

Collage is differentiated from **papier collé** (pasted paper) in that the latter employs various materials and stuffs primarily for their plastic or formal values as texture or pattern, whereas the materials of collage are used primarily for their representative, indicative, and associative values. Papiers collés employ snippets of newspaper, stamps, marbleized papers, street-car tickets, sand, feathers, wire, and the like. As a form of sophisticated artistic expression, papiers collés appear around 1910-1911, in the cubist works of Picasso and Braque. This development was due, in part, to formal preoccupations, the need for pictorial elements meaningless but recognizable, and impatience with conventional artistic materials.

During World War I and later, the Dadaists employed the various cut-out and pasting techniques as the vehicles of their cynicism and mockery of contemporary pretensions, in society generally, and in art; there was no deliberate attempt to prod the subconscious of the observer. Positively, Dadaist activities in the pasting techniques must be seen as another useful extension of the resources for artistic expression, whatever other values they may be found to have.

The terms collage and **montage** are sometimes used interchangeably. Montage, however, is used more often in connection with (1) arrangements made entirely of sections of photographs fitted together (the term **photomontage** is sometimes used), and (2) in connection with the techniques of the motion picture (q.v.). Whereas the ensembles of papier collé are devoid of narrational intent, and those of collage are generally of devious symbolism and suggestiveness, those of montage are commonly of the nature of fairly direct pictographic expression.

The various techniques described have had great influence in various fields of artistic work: advertising art, illustration, packaging, store-window display, photography, typography, stage decoration, and many others have been profoundly affected. See L. Aragon, *La Peinture Au Défi*, 1930; M. Ernst, "Au-Dela De La Peinture", *Cahiers D'Art*, no. 6-7, 1936; G. Hugnet, "Dada and Surrealism", *Bulletin of the Museum of Modern Art*, vol. 4, no. 2-3, 1936. —M.S.F.

**coll'arco.** See pizzicato.

**collate.** *Book.* To collate is to compare. In ordinary binding it is sufficient to check the book by the signatures or pages; when there are insertions such as maps these must be collated with the instructions. In old books of value it is necessary to do more than this, to ascertain not only that the whole of the book is present, but that all that is present belongs to the book. See edition bindings. —H.E.S.

**collecting paintings.** See FORGERIES IN PAINTINGS.

**collector's mark.** A stamp marked or impressed on the margin of a print by the owner. The mark of a well-known connoisseur denotes that the print has, in his judgment, excellent qualities. —R.L.W.

**colofonia.** See colophony.

**Cologne, school of.** Although Cologne has been a famous center of art since the beginning of the Middle Ages we understand by the name "School of Cologne", the schools of painting of the 14th, 15th, and 16th cents. Shortly before the middle of the 14th cent. the paintings in the choir of the cathedral were created. In 1370 a series of frescoes was commissioned for the Great Hall of the Rathaus. Some fragments of frescoes, originally in the Hansasaal of the Rathaus, now in the Wallraf-Richartz Museum, are considered to have belonged to this work. Judging from these fragments, the work is among the most important paintings of the 14th cent. Another highly significant work of the late 14th cent. is an altarpiece commissioned by the nuns of St. Clara now standing behind the High-Altar of the Cathedral. Some of these paintings bear the marks of a really original and important master. Toward the end of the 14th cent. were created such

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

famous works as the *Madonna mit der Wickentblüte* and *Christ on the Cross, before the Madonna and eight Saints,* both in the Cologne Museum, *St. Veronica holding the Sudarium* in the Munich Pinacothek. Some historians tried to credit all these paintings to a personality, called "Master Wilhelm". In the Limburg Chronical of 1380 an artist by this name is mentioned "as the best painter in the German lands". There have been several masters called Wilhelm in the 14th cent. One of them "Wilhelm von Horle" settled at Cologne in 1358, and died before 1378. But the entire question of the authorship of these frescoes in the Rathaus and the St. Clara altarpiece is not yet and may never be settled. In any case the paintings of the Hansasaal, the St. Claren altarpiece and those around the Madonna with the vetch blossom belong to very different artists. The latter works and a number of paintings more or less closely allied to them are ascribed to Master Hermann Wynrich von Wesel, born before 1360. Probably a pupil of Wilhelm von Horle, he attained to great wealth and distinction, and died in 1414. The character of these paintings is indicated by softness, loveliness, enamel-like lucidity of color and a lyrical manner of narration. This line of works is concluded with the Little Garden of Paradise, now in Frankfurt, painted in the early 15th cent.

It is remarkable that Cologne was not in sympathy with the revolutionary movement of paintings in the manner of Multscher and Konrad Witz. Stephan Lochner, the main painter of the 15th cent., although conversant with the progressive development of his time, brought about a kind of counter movement to the naturalism of the 15th cent. Lochner himself came from the region of Lake Constance in 1430 to Cologne and died there in 1451. His main work is the *Altar of the Magi,* painted for the chapel of the magistrates, which now stands in the Cathedral. Dürer, on his voyage to the Netherlands, saw this work and was filled with admiration. Another important work of Lochner is the altar piece representing the last judgment, painted for the St. Laurentius Church. The individual pictures are now in the Museum of Cologne, Frankfort and Munich. Other well-known paintings are the *Madonna of the Rose Arbor* in the Wallraf-Richarts Museum, the *Presentation of Christ in the Temple* in the Hessisches Landes-Museum at Darmstadt, and the *Madonna with the Violet* in the Dom Museum at Cologne. The most important follower of Lochner was the "Master of the Life of Mary". He was closely related to the painters of the Netherlands, especially Dirck Bouts. He was the leading master during the second half of the 15th cent. He takes his name from a series of panels, representing the life of Mary, seven of which are in the Munich Gallery, and the eighth in the London National Gallery. A pupil of his was the "Master of the Lyversberg Passion". This name is derived from eight panels representing the passion of Christ formerly in the possession of the magistrate Lyversberg, and now in the Museum of Cologne. Another Master, belonging to the second half of the 15th cent. is the "Master of the Legend of St. George" ca. 1450-65, whose name is taken from the history of St. George, painted by him. There is also the "Master of the Glorification of Mary" (Meister der Verherrlichung Mariae). He is influenced by Lochner and painters of the Netherlands. His name is derived from the "Madonna in Glory" in the Museum at Cologne. Influenced by the Master of the Life of Mary and the Master of the Glorification is the "Master of the Holy Kinship" (Meister der heiligen Sippe) who worked from about 1480 till after 1510. His name is derived from the painting of the Holy Kinship with Saints and Donors in the Cologne Museum. Excelling by his mastery of technique was the "Master of St. Bartholomew". He drew this name from the representation of St. Bartholomeus and other Saints in the Pinakothek at Munich. He is also called the "Master of the St. Thomas Altarpiece", a triptych representing the incredulity of St. Thomas (1499-1501) at the Cologne Museum. The "Master of St. Severin" lived at about the same time. His name is derived from paintings in St. Severin at Cologne. Other paintings by him are: the *St. Andrew Triptych* for the confraternity of the Rosary, the *Adoration of the Magi* (ca. 1513), and *Christ before Pilate* in the Cologne Museum. He further designed the paintings for the stained glass windows of the north side of the Cathedral (before 1508). The "Master of the Legend of St. Ursula", who painted series of eighteen pictures representing the Legend of St. Ursula for the church of St. Severin, is to be distinguished from he Master of St. Severin although closely related to him in style. Bartholomeus Bruyn and his students brought the School of Cologne to an end. He was born in 1493 at Wesel and died in 1555 at Cologne. He worked for the chapter at Essen and was commissioned to paint the high altarpiece of the

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

collegiate church St. Victor at Xanten in 1529. But he is best known for his many portraits. He brought about the transition of the School of Cologne to the Italian manner of Renaissance painting. **Colonial brass.** See ENAMELLING ON METAL.

**colonnade.** A range of columns.

**colonnette.** A tiny, small column.

**colophane.** See colophony.

**colophonium.** See colophony.

**colophony.** Known commonly as rosin, colophony has little use as a resin ingredient in painters' varnishes. It forms a brittle film, easily discolored by exposure or by dampness, and easily scarred by friction. Mixed with oils, its mechanical qualities are improved. It is now most used as an ingredient in wax-resin mixtures for impregnating wood and for the relining of old paintings on canvas. —G.L.S.

**COLOR** is the general name for the non-spatial component of the sensation arising from the activity of the retina of the eye and its associated nerve systems.[1] Color may be further classified as **chromatic** or **achromatic** depending upon whether it does or does not exhibit hue. Hue is that attribute of certain colors which enables them to be classified as reddish, greenish, bluish, yellowish or purplish.

THE PHYSICAL BASIS FOR COLOR. The physical basis for color is light. **Light** has been recognized as a part of the great electromagnetic field, the visible radiations being of such magnitude that they must be measured in fractions of a micron (one thousandth of a millimeter), and falling within the range of approximately 380 to 740 millimicrons. Thus they form only a very small part of the total known electromagnetic emanations which range from the long radio waves through the thermally active infrared rays, through the visible light rays and the shorter actinically active ultraviolet and x-rays to the radium rays and finally to the shortest cosmic rays.

**Chromatic color** is seen when the total light rays are selectively separated. The separated bands of light begin at the red rays (wave length approximately 740 millimicrons) and go through orange (600 millimicrons), green (520 millimicrons), blue (460 millimicrons), to violet (380 millimicrons). The names here assigned to the respective **chromatic color bands** are those traditionally used for the **rainbow hues.** In the selective separation of visible light rays into chromatic color bands, a complete separation is practically impossible and thus a pure chromatic color sensation is rare.

The process of breaking up light into chromatic color can be accomplished by one of two major methods, **refraction** and **diffraction.** The resultant series of chromatic color bands is called a **spectrum.** A spectrum obtained by refraction is known as a **prismatic spectrum,** ane one obtained by diffraction is a **diffraction grating spectrum.** The latter is the more pure and constant spectrum. A prism bends light rays according to their respective lengths, the shortest being bent the most. The grating which is composed of minute interstices, operates on the principle of intercepting conflicting circular wave fronts of light by a white screen. **Monochromatic light** will appear wherever the crest of two commensurable rays have crossed and been projected onto the screen. The spectra will appear on either side of a white center with the shortest rays appearing closest to the center.

Another method of breaking light into chromatic color is by the **polarization of light.** This is utilized for the chemical identification of substances which emit characteristic chromatic color bands. Certain substances have been found to possess the power of forcing a light ray, which ordinarily would travel in one direction but would vibrate in many different planes, to vibrate in one plane. This process is known as polarizing light. If such a polarizing substance (e.g., quartz) is placed between two prisms, the rotation of the substance will separate white light into a temporal sequence of monochromatic bands.

It will be important for the colorist to recognize that not all visible radiations and consequently not all color come from the sun. There are **incandescent rays** from hot bodies such as the sun or incandescent filaments and there are **luminescent rays** from cold bodies such as fire-flies or fluorescent

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

tubes. Luminescent bodies are more efficient sources of light than are incandescent bodies. One type of luminescence is **photoluminescence** which is light due to the secondary action of short wave radiations acting upon fluorescent or phosphorescent materials. Until recently most practical artificial light sources were incandescent bodies. But in the future we can expect practical development in luminescent and particularly in fluorescent lighting. For various reasons, the chief of which relate to the distribution of spectral colors in the illuminants, luminescent lighting will greatly affect color work. It will be necessary to study as soon as possible how colors of incandescent and of luminescent light sources can be correlated.

An art of mobile colored light has been brought to a high degree of perfection by Thomas Wilfred who has invented the clavilux (q.v.) or color organ. Colored lights correlated with spatial patterns can be thrown upon the screen with this instrument.

THE CHEMICAL BASIS FOR COLOR.

When light is diffused through space some of it reaches our eyes and causes the visual sensation. Most of it, however, is absorbed by opaque bodies and thus loses interest for the colorist. Some substances are not entirely absorptive towards color but are either selectively or entirely reflective or transmissive towards it. Such a substance is known as a **colorant**, the chief of which are the pigments and dyes. Pigments are colorants that are insoluble in water whereas dyes are soluble. When mixed with a carrier the colorants become the paints, lacquers, varnishes, dyes and inks of commerce. The process of producing chromatic color in colorants is known as selective reflection for opaque colorants, selective transmission for transparent colorants or selective absorption as it would apply to both.

Chromatic color as seen by reflection or transmission has been altered qualitatively. The attribute of color especially affected is its saturation. Saturation is the second of the psychical or sensation attributes of chromatic color to be herein defined. Hue was the first. **Saturation** is that attribute of chromatic color which determines its degree of difference from an achromatic color of the same brightness. **Brightness**, the third and last psychical attribute, is that characteristic of any color which permits it to be classified as equivalent to some member of a series of achromatic colors.[1] With respect to the saturation of a color we find that transmitted and reflected colors are not usually as saturated as colors emitted directly from a light source. This is because they are not so spectrally pure.

The inherent chemical structure of a colorant is what affects its ability to reflect or transmit chromatic color. But other physical factors will affect its appearance. It will appear more saturated when its placement makes multiple reflection possible. Likewise different hue and saturation effects (**dichroism**) may be caused by the same dye at relative depths of solution. The **refractive index** of the colorant in relation to the refractive index of its carrier affects its appearance. The greater the difference in the indices of refraction the greater amount of light is reflected. But as any carrier is more dense than the air through which the light has been traveling, a coating of oil or varnish over a pigment will cause it to reflect less light although the light may be more spectrally pure. Pigments are classified as relatively transparent or opaque depending upon whether the indices of refraction of pigment and carrier are respectively similar or divergent. In the use of transparent paints the color of the under surface (**undertone**) and the depth of the color surface (**overtone**) are of importance. This is not true in using opaque paints.

Today the chemistry of the colorants is a very important and interesting branch of commercial chemistry. Until the 19th cent. most colorants were derived from nature. For instance an animal pigment was taken from the cochineal insect, a vegetable pigment from the indigo plant, a mineral or earth pigment from umber. The range was limited and few new colorants were added through the centuries. In 1856 Perkin in England produced the first organic dye and since then color chemistry has progressed rapidly. Every colorist should be enough of a technologist to understand the limitations and possibilities of his media and so a basic knowledge of the theory underlying color chemistry is important. The Research Laboratories of the International Printing Ink Corporation have published an excellent monograph on this subject.[2]

The real reason for the selectivity of a colorant to light is a matter of scientific conjecture. Colorants may owe this selectivity to one or more of their components (e.g., chromium whose compounds are always chromatically colored) or to their molecular structure (e.g., alizarine, $C_{14}H_8O_4$). Most of the latter class of colorants are complicated organic compounds and their molecules are built

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

around carbon in ring formations. **Chromophore** or color-bearing groups usually containing nitrogen, oxygen, hydrogen or sulphur are linked to these carbon rings and the whole is rendered stable by hydroxyl groups known as **auxochromes** or **color-fixers.** The process of establishing new colorants and duplicating old ones requires infinite research and laboratory exactness.

From the craftsman's point of view colorants are quite naturally thought of in pairs which are known as complementary. **Complementary colorants** are two which when combined in the right proportion will produce an achromatic color. Such complementation is due to the very simple fact that if colorant A subtracts all but a limited band of chromatic rays and if colorant B subtracts that limited band, then the result is the absence of chromatic color due to a uniform absorption throughout the spectrum. This same principle operates when any two or more colorants are mixed. The resulting color will be that of the rays to which none of the colorants are absorptive. This process has been termed **subtractive color mixture** because each colorant subtracts from the total reflected or transmitted rays. The end product of subtractive color mixture would theoretically be black. The mixture of colored lights is known as **additive color mixing** because each chromatic light adds to the total light rays and the end product is white light. **Complementary lights** are two which when combined in the right proportion will produce a white light.

When the number of available natural colorants was limited, their interactions could be easily and pragmatically learned. Venetian red and emerald green, for instance, were well recognized pigment complements. Complementation then could be neatly diagramed. Today with the infinitely greater range of colorants it is not so easy to predict colorant complementation or the results of colorant mixing. It is possible that chemical combinations may occur and that the new product may not have the selectivity represented by the subtracted selectivity of its components. It is likewise possible that a colorant may exhibit a hue which does not belong to the spectral rays which it reflects. For instance an aqueous solution of neodymium ammonium nitrate looks yellow but transmits only red and green rays. These combine by additive mixture to form a yellow sensation which Luckiesh[3] rightly calls a subjective yellow. Or it is likewise possible that two colorants may have the same hue and have different spectral distribution curves (q.v. color interrelations). The difficulty which colorists are now experiencing in predicting the results of colorant mixtures has its rosy side which we will discuss under color interrelations.

Complementation of chromatic light and colorants has application in **color photography.** Emulsions which correspond to the yellow, red purple (magenta) and blue green pigments are superimposed in order upon a sensitized film which controls purple blue, green and red light respectively. In effect the picture is taken in three lights which are complementary to the emulsions and the image appears in the same colors as the emulsions. By further example of complementation when projected by a white light onto the screen it appears in its original colors.

THE PHYSIOLOGICAL BASIS FOR COLOR. The human eye has two distinct functions, transmitting the sensation of light and transmitting the sensation of form. The transmission of light is allied with the transmission of chromatic color. All visual sensation is dependent upon the functioning of the light transmitting mechanism. But light may be transmitted without the transmission of chromatic color or the transmission of form. These several sensations require specialized mechanisms in the eye. Thus it is not idle talk to separate form and color, or to separate chromatic from achromatic color. Many animals have eyes which limit their visual sensations to one or another of these.

This article is not concerned with the reactive media of the eye insofar as they effect point to point vision. It is discussing the **photoreceptors of the eye.** These are minute cells, some shaped like nine-pins and called **cones,** and some shaped like elongated cones and called **rods,** which are found in the second layer of the innermost coating of the eyeball, the retina. The retina, with its backing of pigmented epithelium is really an expansion of the fibers of the optic nerve and it lines all but the extreme front of the posterior chamber of the eye. The 30,000,000 rods, and the 7,000,000 cones are not uniformly distributed over the retina. Near the posterior end of the axis of the eyeball is the region called the **fovea centralis** where direct vision is centered. This contains only cones. Near the periphery of the retina there are only rods and the proportion of each type of cell varies in ratio to its proximity to each area. Each cone is connected to a single nerve fiber whereas several rods may share one nerve

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

fiber, all of which send their impulses via the optic nerve to the brain.

Electromagnetic waves reach the eye but those below 380 and above 740 millimicrons are absorbed by the media of the eye through which they must pass before reaching the retina. A small proportion of light rays are likewise absorbed by these media, which consist of the **cornea** (a frontal continuation of the outer sclerotic coating), the **iris** (a frontal continuation of the second or vascular coating) and the lens and humors of the eye. The absorbed infrared and ultraviolet rays may in cases of extreme intensity prove very injurious to the several parts of the eye.[4]

The difference in the distribution of the rods and cones on the retina indicates a difference in function between the two. It is believed, on the evidence of their greater receptivity to images seen in dim light, that the rods (containing a reddish substance, the **visual purple**, which bleaches on exposure to light) are only capable of transmitting sensations of achromatic color and of functioning at a low illumination. The cones are believed to transmit chromatic color sensations and to function for distinct vision. The fact that chromatic color sensing is unequally distributed over the retina and that its distribution bears some relation to the distribution of the cones, has aided this theory. By means of an apparatus called a **perimeter** it is possible to determine the zones or distances from the eye at which various color sensations are perceived. The extremities of the visual field are sensitive only to the achromatic sensations; except for these margins the entire field is susceptible to blue and yellow and only the *fovea centralis* to red and green. This selective sensitivity of the visual field is likewise linked conjecturally with **color blindness**, of which the most common form is the so-called **red-green color blindness.** In this form both red and green appear a yellowish grey to the observer. Red-green color blindness occurs much more frequently in males and is testimony to the fact that in genetics color vision is a sex linked characteristic. The second type of color blindness, known as **monochromatic blindness**, in which there is complete absence of monochromatic color sensation generally occurs when there is complete destruction of the *fovea centralis* and so it is probably an accompaniment of loss of cone function.

**Theories of color vision** are in a conjectural state. The **Young-Helmholtz**[5] (Thomas Young, 1773-1829; Hermann von Helmholtz, 1821-1894, physicist) theory is perhaps best known. It assumes that different cones have nerve fibers giving rise to qualitatively different sensations based on the physical primacy of red, green and blue. (Primary chromatic colors whether in lights or colorants are those from which all other colors can supposedly be made.) There is no anatomical evidence that these sets of nerves are present or that nerve fibers can transmit qualitatively different impulses. The theory correlates with the facts of additive light mixtures and it agrees with the data expressed in the **Koenig sensation curves** where the various light rays were charted according to the sensations which they stimulated and where the sensations fell into three distinct groups, red, green and blue.

The **Hering**[6] (Ewald Hering, 1834-1918, physiologist) theory of color vision assumes six fundamental coupled sensations, black and white, blue and yellow, green and red. There is imagined in the retina three distinct substances each capable of anabolic or katabolic reactions under the influence of radiant energy. The anabolism of each of these substances creates the first of each of these paired sensations, the katabolism the second. This theory accords well with the fact of zoned retinal sensitivity and with the fact that black and white are distinct sensations.

The **Ladd-Franklin**[7] (Christine Ladd-Franklin, 1847-1930, psychologist) theory supposes that a photochemical substance exists in the rods. Upon dissociation it causes the grey sensation. In the cones the grey molecules undergo two stages of further dissociation. The grey molecules contain two groupings. The dissociation of one of these causes a yellow sensation, of the other a blue. In the second stage of dissociation the yellow grouping is divided into two new groupings, the dissociation of one giving rise to the red sensation and of the other the green. It is thought that the degree of dissociation is due to the wave length of light impinging upon the photochemical substance.

There are other theories of color vision, notably the so-called **Duplicity theory** which is associated with the name Von Kries (Johannes von Kries, 1853-1928, physiologist). It attempts to separate chromatic from achromatic color vision on the anatomical evidence of the rods and cones.

In completing the discussion of the physiological basis for color vision we must consider the eye as a refractive instrument containing a lens and other refractive media whereby point by point vision is made possible.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

For this purpose the chief fault of the eye for chromatic vision is its lack of achromatism. All the rays of a continuous spectrum cannot be focused on the retina at the same time. If the long rays are focused on the retina the short rays will be focused in front of the retina and vice versa. The mixture of the two rays not distinctly focused will cause the image to have a violet fringe known as the **dispersion circle.** The achromatic lens is made by combining a convergent lens made of crown glass (more convergent for blue) with a divergent lens of flint glass (more divergent for blue).

THE PSYCHOLOGICAL BASIS FOR COLOR. The psychological aspects of color can be discussed under two headings. The first is concerned with receiving chromatic color sensations which have not emanated from corresponding spectral rays. One of these subjective sensations has already been discussed in the discussion of additive mixtures. Another example of subjective color sensation is when the chromatic color can be perceived when gentle pressure is applied to the closed lid over the eyeball or when a controlled current of electricity travels from the forehead to the hand of a patient who is seated in a dark room. The reason for this phenomenon lies in the excitation of the retinal nerves by pressure or by electricity. **Subjective color** can likewise be obtained by rotating achromatic discs (Benham's discs). This is due to an abnormal state produced on the retina by the alternate exposure to light and darkness.

**After-images** and **contrasts** are the principal ways of seeing subjective color. After-images refer to the experience of a color sensation after a color stimulus has been withdrawn. After-images are of two sorts, positive and negative. The former are the same color as the stimulus and are seen when the eyes are closed after looking for some time at an intense stimulus. The latter are complementary to the color of the stimulus and are usually seen when the eyes are directed toward a neutral tone after looking for some time at an intense stimulus. The reason advanced for positive after-images is the persistence of the chemical process in the retina after the stimulus has been withdrawn. The process of retinal fatigue is usually given as the reason for negative after-images.

Contrasts are closely allied to negative after-images. The only difference lies in the fact that negative after-images are projected upon an achromatic surface whereas contrasts are projected upon other chromatic surfaces thereby altering them in kind, e.g., in hue, brightness or saturation. Contrasts are subjective color phenomena whereby color sensations are being changed not by direct alteration but by controlling the color which lies adjacent. M. Chevreul,[8] one of the most famous and earliest of the theorists on color combinations, studied the subject of color contrast thoroughly and although his deductions were not proven by experiments of modern scientific exactness, nevertheless his perceptions were keen, his methodology was objective and his general laws of contrast stand the test of time. The fundamental **law of contrast** states that whenever the eye sees two contiguous colors at the same time they will appear as dissimilar as possible. In hue contrast adjacent hues (similar wave lengths) are pushed apart in hue and weakened in saturation, whereas dissimilar hues are pushed apart and strengthened and complementary hues are unaltered in hue but strengthened in saturation. Rood[9] illustrates this diagramatically. The reason for this is that each color is affected as though the after-image of the contiguous color were projected upon it. By contrast strong saturation seems stronger and weak saturation weaker in contiguity. Brightness contrast leads to the phenomenon called **induction** whereby in a graded series of grey papers the edge of a lighter strip that is adjacent to a darker one will appear lighter than the other edge of the lighter grey strip.

For the best demonstration of contrast two colors should be alike in the two attributes which are not expected to exhibit contrast. Likewise the spacing of colors is an important factor in color contrast. Hues which possess similar wave lengths operate according to the law of contrast if they are spatially isolated (e.g., spaced relatively far apart). If, however, they are spaced in narrow striped sequence, they strengthen each other because of the additive mixture of their reflected light rays. The same holds true for dissimilar hues which act according to the law of contrast when widely spaced in color areas and which exhibit the opposite effect and appear neutralized when the rays are diffused from a narrow striped sequence.

Another observable fact with relation to subjective color is in a sense the reverse of the phenomena of which we have just been speaking. **Color constancy** is the phenomenon whereby colors when placed in various illuminations seem to preserve their identity and to remain unaltered. This is a subjective color phenomenon in the sense that the color which

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

the mind registers is not the color which the objective photographic plate registers. To date Katz[10] has done the chief experimentation in this field and has worked only with achromatic color. The basic experiment in color constancy is important and is as follows: Forty-eight squares of the achromatic color series were arranged upon a sheet of grey cardboard and were placed in such illumination as one would find at noon in the summer under a slightly clouded sky. This type of illumination is known for experimental purposes as **normal illumination.** The observers characterized each of the colors in a definite way in language, e.g., white, black. The experiment was then repeated at one-fifth the illumination and to the observers there was apparently no change in the colors. Thus by absolute standards of judgment color constancy within the limits of a one to five ratio in change of illumination seemed to be a fact.

When the comparative method was used, when two identical series of achromatic papers were viewed simultaneously at different levels of illumination, the illumination appeared to alter the color slightly although not in a comparative ratio. When the observer matched a "greatest whiteness" paper five metres away with one of a similar series of achromatic papers held in his hand, it was found that by photometric measurement the paper selected was reflecting approximately twenty times as much light as the more distant paper. The two papers were judged equally white but a difference was noticed between the two papers and Katz calls this difference one of **pronouncedness.** This Katz calls the fourth dimension, or more correctly, the fourth attribute of color. The colors near white vary as white in exhibiting pronouncedness. In other words the dimmer the illumination the less their pronouncedness. With the greys a region is reached where it is difficult to tell whether the more highly illumined or the less highly illumined show the greater pronouncedness. And for the blacks and the colors near black, the less the illumination the greater the pronouncedness.

These experiments in color constancy have led to two definitions. **Apparent color** is the immediately perceived color as seen at any time in any illumination. **Genuine color** is the color as seen only under the conditions of illumination described as normal. The colors which maintain their qualitative character most stably are the whites and the colors near white. The darker colors become the greater the differences that illumination will make between their apparent and their genuine colors.

Rood is one of the few observers who comments upon changes brought about in chromatic color by differences in illumination. He observes that a bright illumination causes all chromatic colors to appear more yellow and a dark illumination causes them to appear more blue. He explains this on the basis of the Young-Helmholtz theory of color vision. Mr. H. Barret Carpenter,[11] a worthy disciple of Rood, illustrates this law in his illustrations of objects as they show what he has termed "the natural order of colors."

There is yet another effect which changes in illumination bring to a color, known by the name of its discoverer as the **Purkinje effect.** At lowered illuminations the maximum of the luminosity curve has shifted toward the shorter wave lengths. At normal illumination the maximum of the luminosity curve is at about 550 millimicrons (a warm yellow). **Luminance** or the psycho-physical quality of appearing to reflect light, does not correlate directly with brightness but is the result of the product of brightness and hue. The reds and the violets are hues of low luminance. But according to the Purkinje effect if two hues of short and long wave length respectively are produced so as to have equal luminance at normal illumination, then as the illumination drops the hue of short wave length would appear to have more luminance. Thus the maximum of the luminosity curve would shift to the green yellows at lower illumination.

The psychologist has likewise defined the **modes of appearance of color.** In so doing he has left the field of subjective color and is discussing the second large heading, namely **objective color,** color emanating from spectral rays, as the mind perceives it. The most important modes are those of surface colors, film colors and volume colors. **Surface colors** are those which appear to have a surface in which the color lies. **Film colors** lie in a plane which is extended in space and which does not in the same sense possess a surface. A film color always has a frontal parallel character whereas the orientation of a surface color is always that of the surface upon which it lies. Surface and film colors may be further qualified with respect to their appearance of being seen through transparency. **Transparent film colors** are film colors as viewed through a piece of colored gelatin. This is different from the first or space-delimiting film color

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

which is as though it were extended through space in the form of a bi-dimensional plane for which it functions as a rear boundary. **Transparent surface colors** are transparent colors which are obtained through the medium of opaque objects. For instance, if one eye is fixed on a point and a colored opaque cardboard is introduced at about half the distance before the other eye, the fixated object will give the impression of being seen through the color of the opaque object. Thus transparent surface colors present a texture derived from the opaque objects whereas transparent film colors do not present any texture. **Volume colors** fill three dimensional space and, like the color of a fog which is apperceived only as long as objects can be seen through it, they should be transparent. Volume colors can be seen in colored glass and colored transparent liquid.

There are other modes of appearance of colors which are less fundamental than the above. **Mirrored colors** are seen when the surface of an object is smooth and the light reflected from it is of such a nature that we can recognize images by it. When the surface is not in itself colored then the mode of appearance of the color of the image is that which was presented by the original object. Thus we seem to see mirrored objects behind rather than through the mirrored surface. But when the color of the mirroring surface is visible, the reflected object is seen behind that surface but through the color of that surface.

**Luster** is another color mode which a color assumes when the surface of an object is smooth but the reflected light is of such a nature that we cannot recognize images by it. Luster can take on different appearances such as the luster of silk or of metals. This does no mean that this type of luster is restricted to the kind of material which has given it its name but that it is most commonly seen as associated with this material. Luster has certain characteristics. It appears only on an object; it exceeds the color of the object in brightness; it partially destroys the surface structure of the object and it is apprehended as being distinct from the color of the object and as lying in front of the object. **Glitter, irridescence** and **opalescence** are terms used to refer to the luster of specific kinds of objects which are moved about. The research laboratories of the International Printing Ink Corporation have used the term luster, as though it were synonymous to the effect of bronze as duplicated by certain inks and they do not mean luster light. Katz describes various kinds of luster in detail and Birren 12/ illustrates Katz's types with colorants.

Luminosity is a color mode which has been variously described. To Katz and the psychologists it is the mode of appearance which is obtained when film colors are of greater brightness than their surroundings and when there is no definite defined figure. **Glow** is the same mode of appearance when there is definite defined figure. According to the Optical Society definition luminosity is a substitute for the older term, **visibility**, or the luminous efficiency of radiant energy. It is a correlative of light when one wishes to call attention to this particular attribute of light. The psychological and psychophysical definitions both contain the idea that luminosity describes emitted rather than reflected light and is thus the appearance of illumination.

Another field of psychological observation in objective color work is concerned with the effects that colors have upon the observer. It relates objective color to subjective effects. It is apparent, for instance, that certain hues seem to advance and to make objects seem nearer while other hues recede and make objects seem farther away. Likewise the hues of long wave lengths seem warmer than the hues of short wave lengths. The first phenomenon is probably related to the lack of achromatism of the eye and the second is probably due to the association with the colors of fire. Actually the hue exhibited by intense heat is white and blue rather than red. The fact that white reflects light and black absorbs it affects the actual warmth of these tones.

Again the psychologist is concerned with the effect that colors have upon the moods of the observer and he is interested in the color preferences of the observer. Much investigation along this line has been carried out by commercial interests and much valuable material of a pragmatic nature has been discovered. The material which the pure science of psychology has collected has not yet been of sufficient scope to formulate into general laws. Excellent bibliographs of this material are available[13] and the reader is referred to them for added study in this field. In addition to these two legitimate types of sources on this subject much material has been published which smacks of quackery. It is a ripe field for this sort of thing for there is the suggestion of occult powers in

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

anything which is mysterious and is connected with man's emotions.

Humanity is apt to endow the things which it does not understand with many powers. Thus tertiary qualities or human and superhuman qualities have been projected by man into colors. From this it is only one step farther to accept the color as the symbol for this quality. Red, for instance, was the symbol of health, power and anger. Green symbolizes hope, immortality and victory. Then the color symbol became associated with the god who symbolized this quality. White was the symbol of Jupiter. This close association of color with the religions of primitive peoples retarded scientific investigation of its nature until the time of the rationalizing Greeks. The important hypotheses which they set forth lacked experimental proof and were forgotten for many centuries but they held the kernel of the scientific truths about color which have been discovered from the 16th cent. to date. In our day color symbolism has lost much of its meaning but powerful vestigial evidences remain in marriage and mourning colors, ecclesiastical and academic colors and even in sporting colors.

INTERRELATIONS IN COLOR WORK. Much of the difficulty in color work has been caused by the fact that the interrelations between its various aspects were not understood and defined. The fields which must be correlated are: color as radiant energy (the physical field); color as sensation (the psychical field); and color as the sensation of light (the psycho-physical field). In addition, colorant chemistry is part of the picture.

A word of explanation will show the reason for the fundamental three-fold division. Color is a form of radiant energy. Its rays can be measured in length and in the amount of energy emitted. A quantitative expression for the radiant energy at each wave length can be plotted on a graph in which the abscissus is the wave length and the ordinate is the energy radiated. Such a curve is called an **energy emittance curve, an energy transmission curve or a radiometric curve.** It is the basic data, the physical measurement data on which rest all photometry and all colorimetry.

This radiant energy would be a reality and a potentiality in our universe even if man were not equipped with eyes. But because he has a visual apparatus, a limited band of radiant energy possesses for him the quality of luminance or it becomes luminous energy (light). Now he wants to know not the absolute amount of energy of the electro-magnetic rays but the amount of energy at each wave length relative to some standard source of luminous energy. He wants to know a physical measurement but he wants to relate it to a light sensation with which he is familiar, which comes within his experience. Thus we have a psycho-physical aspect to color. Such a psycho-physical measurement is found in the spectral distribution curve in which the abscissus is the wave length and the ordinate is relative to the energy of a specified wave length of a known illuminant. As light is likewise seen by transmission and by reflectance we have spectral transmission curves in which the wave length is plotted against the percentage of the incident ray which is transmitted and spectral reflectance curves in which the wave length is plotted against the percentage reflectance with respect to a standard white substance like magnesuim oxide which has a reflectance of approximately 98% throughout the spectrum.

We have already seen that the visual judgment of color depends upon many factors. But after all it is this visual judgment of color which is the final concern of the artist and the colorist for upon it will rest all subjective effects. This is the sensation aspect of color work. In so far as the visual judgment of a colorant is affected by a luminant the result can be determined by multiplying the energy emittance curve of the illuminant by the spectral reflectance curve of the colorant. The result is the energy distribution curve for that colorant under that illuminant.

Mention has been made of primaries and complementaries in lights and pigments. The psychological primaries are called red, yellow, green and blue as well as the achromatic black and white. The reason given for their primalcy is that they are unique sensations and that all other pure color sensations resemble one or another of these. In complementing sensations, yellow is coupled with blue and red with green. They are called complementaries because under proper viewing conditions they are the only sensations which will not alter each other except to give the utmost sensation of brilliance. Luckiesh has described an apparatus for viewing light complementaries. After-images are an index to sensation complementaries. Colorant complementaries can be discovered by colorant mixture and if the results are at present often indeterminate, that very fact is instant

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

of the many new colorants which are continually being developed. Consequently it may soon be possible to produce a diagramatic system of material colored standards where the various kinds of complementaries exhibit the same hues. Theoretically this should be true.

The Optical Society of America under the auspices of the Inter-Society Color Council has been working for some time in an attempt to define and correlate interrelated terms used in color work.[1] Their latest recommendations are as follows: In considering achromatic color, radiant energy in the objective physical field correlates with luminous energy (light) in the psycho-physical field, and with color in the subjective psychical field. Calling these fields A, B and C respectively, radiance emittance in A is described by the radiant energy transmission curve (radiometric curve); luminous emittance in B is described by the spectral distribution curve and achromatic color in C is described by its sensation attribute. The corresponding attributes are radiance in A, luminance in B and brightness in C. For chromatic color we again speak of radiant energy in A, visual energy in B and chromatic as well as achromatic color in C. The attributes are the spectral composition plus the radiance in A, either the tristimulus values (q.v. color determination) or the dominant wave length, colorimetric purity and intensity in terms of reflectance, transmissance or luminance in B, and hue, saturation and brightness or brilliance in C. Relative brightness may be expressed as value or lightness. Chromaticity is a combination of hue and saturation.

In naming the sensation attributes not all colorists are in agreement. The Munsell nomenclature uses chroma for saturation and value for brightness. Prang charts use intensity for saturation. Birren uses tone as synonymous with an unsaturated color. Tone should more properly be reserved for the designation of any color considered with respect to its attributes but indefinite as to the characterization of its attributes. Tint and shade may be defined respectively as any color tone which has more or less brilliance than it would have in its spectral hue.

COLOR IDENTIFICATION. Color identification is dependent upon measurement and systematic specification. It utilizes certain instruments for measuring and translates the measurements into specifications with reference to the fields of color work.

Spectroradiometry is basic to all absolute photometry and colorimetry and all other types of measures can be obtained from the spectroradiometric curve. However spectroradiometry is still a difficult process with the available instruments.[14]

When spectroradiometry is abandoned for comparative measurement, the first essential is a standard set of viewing conditions. These were furnished in 1931 by the International Commission on Illumination and consist of specifications for a standard white light and for characteristics of the eye of the standard observer. There are two types of instruments which give comparative spectral energy distribution data, the spectrophotometers and certain of the visual colorimeters. The **spectrophotometers** are instruments so arranged that the intensity of rays of the same wave length in a known and unknown spectrum can be quantitatively and photometrically compared. The results may be given in terms of the already defined spectral distribution curve (comparative luminance at each wave length) or they may be translated into the simpler psycho-physical specifications known as the tristimulus values.

To understand the tristimulus values which was the type of color determination standardized by the I. C. I. in 1931, we must go back to the Young-Helmholtz theory of color vision and assume the existence of the three sets of nerves particularly sensitive to red, green and blue overlapping bands of the spectrum. The I. C. I. then charted and standardized the sensitivity curves of these nerves (q.v. the Koenig sensation curves). These curves are plotted on a diagram where the abscissus is the wave length and the ordinate is the relative sensation produced at that wave length by a primary light source. The I. C. I. spectral sensitivity curves are based on color mixture data and although the presence of these nerves has not been confirmed, the spectral sensitivity curves are adequate as an aid for color mixture determination.

**Tristimulus values** are the values which indicate the degree to which the red, green and blue nerves are stimulated by a color with respect to the degree (100%) in which they are stimulated by a pure white material. They are strictly sensation values in that they represent a formula which if duplicated should provide the same sensation. They are related to definite physical measurements so they are psycho-physical values. They are obtained by multiplying the energy distribution curve of the standard white light by

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

the spectral reflectance curve of the given material (obtained by the radiometer or spectrophotometer to get the energy distribution curve of that material which in turn must be multiplied by the three primary light sensitivity curves. In tristimulus symbols, X is the value for the red primary. Y is the green primary and the photometric quality and Z is the blue primary. There are other tristimulus systems besides the I. C. I. system and work is in progress to coordinate the various tristimulus systems.[15]

Another system of psycho-physical identification and specification of color is the **monochromatic plus white system.** These specifications may be obtained from the tristimulus specifications or they may be found on a visual colorimeter. This system is based on the matching of the unknown against a monochromatic light whose wave length can be varied throughout the visible spectrum and a source of white light. Every color except purple can be so matched and purple can be specified in terms of its complementary green. The monochromatic method gives a specification in terms of dominant wave length and colorimetric purity. The dominant wave length of a light is the wave length of the monochromatic light which must be added to the white light in order to match the unknown or, in the case of purple, it is the wave length of the monochromatic light which must be added to the unknown in order to match the white light. The ratio of the amount of monochromatic light to the amount of white light represents the **colorimetric purity.** Thus spectral colors have a purity of 100% and achromatic colors 0%. The brightness factor, if used, must be obtained directly from the Y tristimulus value. For instance, if the Y value is 17, then the brightness factor is 17%. This method of designation is often used not because of simplicity of execution but because it provides measurements in terms which are more easily visualized in relation to the sensation attributes of color. The dominant wave length correlates with a diagramatic hue angle and the purity factor correlates with a saturation radius whereas the luminous intensity (brightness) factor can be related to a polar axis. It can be seen that neither the tristimulus values nor the monochromatic plus white values give positive physical color identification. Consequently they might provide two colors with the same specifications which would not have the same physical measurements and so would appear different under different viewing conditions.

There are **visual colorimeters** which by utilizing mixtures of the three primary lights can give measurements yielding the tristimulus values directly. These are still farther removed from relation with the spectral distribution curves and so possess the limitations of purely sensation measurement.

**Color temperature meters** can measure color positively and visually but are of limited application for the color must fall exactly on the Planckian locus in order to be located by one point. The Planckian locus is the locus or energy radiation curve of an ideal theoretical body which emits more energy at each wave length than any other body at the same temperature.

COLOR SYSTEMS AND BASIC DIAGRAMS. In speaking of color identification mention was made of systems of color identification. In the following paragraphs we are concerned primarily with color systems. A **color system** is one providing a specified match for any color to be specified in terms of lights or of colorants.

Inasmuch as systems involving light specifications cannot easily be illustrated they are expressed in graphs or diagrams. The tristimulus specifications resulted in the **triangular diagram.** Clerk Maxwell was the first to describe such a triangle. He obtained his tristimulus values in an elementary manner by rapidly rotating chromatic discs known as Maxwell discs. On the Maxwell isosceles triangle the primaries are at the angles and a color is plotted by erecting three perpendiculars to the sides which are proportional to the tristimulus coordinates.

The monochromatic plus white specifications lead more naturally to the diagram of the **color solid.** As already mentioned, the dominant wave length specification can be expressed by an angle and the colorimetric purity by a radius. Brightness can be graphically described in either the triangular or the solid diagram by relating the chromaticity plane to an achromatic pole. Brightness in the triangular diagram is usually expressed directly from the green (Y) specification.

Systems of material standards (colorants) are more comprehensible and more usable for the average colorist. Some such systems utilize transparent media as standards. Among these are the **Lovibund glasses** consisting of three sets of primarly colored glasses from which by the subtractive method of mixing any color can be matched, and the Arny solutions whose concentrations are adjusted to produce the color match.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

Other systems of material standards utilize pigmented or dyed surfaces. With these there can be no automatic and inherent system of designation unless the standards have been coordinated with the tristimulus or monochromatic plus white specifications. Usually the systematic aspect to the color specification is somewhat arbitrary although related to the method of measuring the standard surfaces.

Some so-called color systems of pigmented or dyed surfaces fail in two basic requirements of a system. Their pigmented surfaces are not carefully standardized and highly permanent and the number of these standard surfaces is not large enough to represent the considerable number of possible surface colors.

One color diagram which could scarcely be called the basis for a material standards color system is the six and twelve hue **color circle of Chevreul.** Yet it is important because it is preserved today in the standard papers and colorants published by the Prang Company and by other companies. The names given to the six hues, red, orange, yellow, green, blue and violet are probably the most popularly used color names today. Using Prang colorants, the spacing of the hues on the diagramatic circle provides a quick clue to colorant complementation.

The **color system of Wilhelm Ostwald**[16] (1853-1932, physio-chemist) is of importance. Ostwald's work is based on the Hering color vision theory and his diagram follows the color rhomboid concept of the psychologist, E. B. Titchener. Ostwald arranged twenty-four hues around the equator of his solid so as to place the psychological complementaries opposite each other. He likewise claimed that these were optical (light) complements. His hue circuit exhibits an interesting correlation of these two sets of complementaries. The equator circumference hues possess the greatest spectral reflectance. Above the equator the hues are progressively mixed with white and below with black pigment. Every color is specified and located on the solid by a number (hue) and two letters (percent white and black respectively). By subtraction from 100% the percent pure color is derived. Thus the specification of a hue should not only locate it on the solid but should approximately indicate its pigment composition.

The Ostwald system is of such importance as to have elicited spectrophotometric measurement of its standards by various investigators and to have called forth studies on its correlation with various tristimulus systems.

Ostwald[17] himself originally published one hundred sixty-eight material standards and the English translation[16] of his work has given a more regular set of the same standards.

The **Munsell**[18] **system** (Albert Munsell, 1858-1918, artist) presents the most complete index of material standards to date. Mr. Munsell's original plan for this system was that it should conform to a purely psychological requirement and, at the same time, that the assignment of the notations should be based upon a reproducible system of psycho-physical measurement. There are many who believe that despite the difficulties inherent in perfecting such a system, the Munsell system comes closest to its attainment. It is used as the basis for standardized color work by the National Bureau of Standards and by many commercial enterprises. It is the object of continual critical study and revision by the Optical Society of America in conjunction with the Inter-Society Color Council.[19]

The Munsell system bases its diagram on the idea of an approximate sphere. The hues at maximum spectral reflectance are placed on the surface (or out from the surface) of the solid at their spectral brightness levels. Ten hues (five principal) were chosen (to coordinate with the decimal system) which would at equal saturation and brightness spin to a neutral grey. The placement of the hues is in accordance with optical (light) complementation.

A Munsell color is designated by a hue name (an objective rather than an associational terminology was used, e.g., yellow red rather than orange), a number which closely parallels the square root of its luminous reflectance (value) and a number which is proportional to its colorimetric purity (chroma).

A psychological color diagram (not a system) is the circuit of material standards which Mr. Birren calls the **Rational Color Circle.** It consists of thirteen hues which he claims have uniform psychological sensation steps between each other. The complementation thus bears no relation to light or pigment complementation. His nomenclature, which closely follows Ostwald's, uses associational terms, e.g., ice-blue, leaf-green.

There are several other arbitrary systems of material color standards which should be mentioned because they continue to serve a useful although somewhat limited purpose. Color dictionaries give us popularized color names in terms of material standards. The dedetermination of the Munsell notations for all color samples in the Maerz and Paul Diction-

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

ary of Color[20] has been begun by the Inter-Society Color Council. The Textile Color Card Association publishes seasonal cards for its members.[21] It is the accepted authority for color names in the textile and allied industries. The Ridgeway Dictionary[22] was prepared in 1912 for the identification of colors in natural science. Today commercial color interest have coded color terminologies of their own which are usually coordinated basically with the Munsell system.

A method of designating colors which possesses qualities of both a color dictionary and of a color system is the ISCC-NBS method. It is the joint product of the Inter-Society Color Council and the National Bureau of Standards. The designations of about eight hundred colors are non-numerical but are systematic. The boundaries between color group names have been adjusted so as to accord as closely as possible with common usage and have been expressed in terms of the Munsell color system.

COLOR COMBINATIONS AND COLOR FORM. All this preliminary discussion from the artist's point of view would be useless if it gave him no clue to color combining and to color form. One difficulty in arriving at any theory of color combining is due to the many variables, both physical and psychological, which the subject presents. Absolute objective standards in the stimulus, as well as controlled conditions of viewing and objective standards of judgment are difficult to obtain. Conceptual principles, however, can and have been set down which are in the nature of prescriptions to be followed in ord r to gain certain kinds of results. Leonardo da Vinci examined some of these. Chevreul formulated the first systematic attempt to cover the subject of color combining. From his laws of contrast and harmony has stemmed the conception of monochromatic, analogous, complementary and triadic color schemes which are to be found in most modern textbooks.[23] Chevreul suggested the operation of his laws in terms of the three sensation attributes of color whereas many texts limit their discussion to hue. However the conception of **balanced colors**[24] whereby areas, brightness and saturation are so related that with given hue combinations an optical complementation by disc mixture results, is probably derived from Chevreul's laws and from the facts of the Maxwell disc mixtures.

Ostwald based his color harmonies on the **Ostwald color rhomboid.** Birren's work is based on Ostwald's. The basic conception is that harmonious colors have some underlying compositional factor which renders them allied. In the Ostwald harmonies this is the pigment factor, such as per cent black or white.

Carpenter has done work which illustrates the use of values (relative brightness) in handling analogous hues. The eye is more accustomed to the spectral order of values but in reversing this order more arresting effects may be produced.

Graves[25] has indicated nine paths through the Munsell solid which he calls color scales. A **color scale** would be a series of graded colors which would progress systematically by continuous variation with respect to one or two attributes of the component color. Graves, in scale 9, has a séries wherein no attribute of the graded series is held constant but the progression is by systematic differences in all three attributes.

Birren uses the term, **dimension,** to describe the direction in which the eye is attracted along such progressive paths. **Notan** usually refers to such a progression in a value scale which is introduced for the sake of design, as in Japanese art, rather than for the sake of representational modeling. **Chiaroscuro** refers to the use of value progressions for representational modeling as was customary in Renaissance painting. In speaking of dimension Birren introduces the idea that to follow along the path of a scale produces a smoother effect than to jump backwards and forwards. Graves likewise mentions the concept of **color chords** and illustrates a limited number of such. A chord might in a broad sense be thought of as a progression on a color path or scale which has larger color intervals and where these intervals may have other proportions than are found in the repetitive spacing of a scale.

All of these concepts have made important contributions to the study of color harmony and color form. **Color harmony** is really a psychical phenomenon meaning a group of colors which seem pleasant when viewed together. Science is searching for the psychophysical basis, if any, for this phenomenon. **Visual aesthetic form** involves the selection and arrangement of the components of the visual arts (color, the appearance of texture, and the spatial component) into an orderly arrangement or composition. Thus it is easily seen that at present the basis for judging form can be more objective than the basis for judging harmony. Design is described by Dr. Thomas Munro[26] as one of the modes of

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

composition in a total form wherein the details are organized so as to emphasize orderly arrangement (repetition, variation and contrast) among component traits. A component trait is a trait of a component with respect to which it can be compared with other traits which are like it in kind; e.g., in Munsell nomenclature the color red is a trait of hue, 8 is a trait of value. **Color form** is the design aspect of color so composed as to mesh with the design aspect of the other visual components in the total aesthetic form. Few colorists have considered the problem of **color design form.** Once again we refer to the conception of balanced colors as making a contribution to this subject because the concept of balanced colors relates colors to areas. Graves has made a contribution in relating his color chords to areas.

Although it is very doubtful and probably not especially desirable that many artists should synthesize color form by rote, nevertheless a background knowledge of how this can be done, such a knowledge as comprises a knowledge of the various bases for color and of the concepts of color harmony and of its integration into aesthetic form, should be helpful to every colorist. This is particularly true for such visual arts in which the design organization is of relatively great importance, namely the decorative arts, the theater arts, interior design and architecture. Colors take their places in color form in accordance with the way in which the color traits are organized and with the way in which the organization integrates with the organization of the traits in the textural and spatial components. This statement is broad enough to bear no exception and particular enough to indicate a definite line of reasoning. Armed with color knowledge and this basic concept we will still have color geniuses and colorists who do mediocre work.

**color in architecture.** Color has been used as a conscious element in the design of buildings for various purposes and with varying degrees of skill by nearly all civilizations. It is in-

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

separable as a negative element in construction of any sort, for no building material is devoid of color, whether or not employed with recognition of this characteristic. As an optical phenomenon—a property of the reflection, diffraction, diffusion or absorption of light, its transmission and our sensory perception of it—color is not a strictly structural element in architecture, nor is material color generally so conceived by architects. It is therefore exceptional in the history of architecture to find color considered and used as a major, primary factor in design, save as a function of light and shade; the customary practice has always been to apply color as a decorative adjunct, to treat it as an accessory material related only distantly and vaguely to fundamental design. Material color is of architectural utility in any form in which it may be applied or attached to the surfaces of a building or may inhere in the structural materials themselves, as, stone, wood, and compositions in which pigments may be mixed. The most widely used materials and composites of aesthetic value for their qualities of color are: glazed tile, first employed in the early Mesopotamian cultures, later an important decorative element in Gothic and Dutch Renaissance buildings; sheets or thin slabs of stone, as, marble, porphyry, malachite, lapis lazuli, extensively used in the more luxurious Roman and Renaissance architecture in flat areas or composed patterns for inner and outer walls and floors or as translucent panels; strips or slabs of wood chosen for color and grain for use in floors, ceilings and wall panelling, first extensively developed in the Gothic age, constantly refined in subsequent periods (marquetry, etc.), and restimulated in the 20th cent. by the invention of methods for producing large sheets of malleable, veneered plyboard; wood is further suceptible to painting and carving to increase its tonal values; brick, the color values of which are notably increased by age, the chemical effects of weathering, and the modifications produced by the lichenous growths for which it is frequently host; glass and stone mosaic, employed notably in Roman and Byzantine buildings; sheets of glass and mirror, whether colored or plain; and pigments in various forms; as paint or tint applied flat to wall surfaces or mixed in plaster and concrete; enamel, applied flat to wall surfaces; burned, as accidental or deliberately introduced earth colors into floor and roofing tiles, a method in universal use from very early times in oriental as well as western architecture; as lacquer, conspicuously used in Chinese and Japanese architecture; as polychrome, a decorative expedient developed notably in classic Greece and in Gothic architecture, where it is usually applied directly on stone or wood; and as fresco, for the decoration of interior and exterior plaster walls and ceilings, practised throughout Europe and Asia from Egyptian times to the present. Modern experiment has developed a new source of color with vast architectural implications, light itself, produced by artificial means, which is suceptible of infinite changes, combinations and permutations. The fundamental importance of color in architecture is both psychological and technological; it has always been used to increase the comfort and aesthetic pleasure which buildings can provide; it is now also an important factor in increasing the utility of buildings through correcting the quantities and qualities of available light, whether natural or artificial. The major uses of color in architecture are: to induce the feeling of warmth or coolness; to decorate otherwise barren spaces; to modify apparent size, either through the progressive and recessive qualities of color itself or through illusory decorative treatment; to indicate function, particularly where certain colors are associated with a ritual significance; to create or simulate an atmosphere of luxury; to heighten emphasis and drama; to provide a subtle counterpoint to the bolder rhythms of architectonic forms; to produce harmony in the spatial relations of buildings with each other and with their landscape settings; and to provide the most efficient and restful reflective or absorptive surfaces in places requiring extended visual effort.

**comb.** *Book.* A comb-like tool with teeth used for marbling edges, end papers, etc.

**comb dovetailing.** See TAPESTRY.

**combination tone.** See ACOUSTICS.

**comic element in music, the.** The most rudimentary variety of musical humor may be compared to such primitive practical jokes as those involving an unexpected ducking, sitting on a tack, and the like. The essence of these performances is a sudden and disconcerting physical shock. Such is the unexpected forte chord which interrupts the gentle course of the slow movement of Haydn's *Surprise Symphony* and furnishes the reason for the title.

Even in this example we can see the germ of the next type of which the essential characteristic is incongruity. In Saint-Saëns' *Carnival des Animaux,* for example, the elephant is depicted by the double bass which plays the melody of the Berlioz *Dance of the Sylphs* from the *Damnation of Faust.* Admittedly this passage is funnier if the listener knows the title of the tune quoted, but the unsuitability of the hollow and ungainly tone of the bass to this dainty waltz theme is clearly the core of the jest. In a less obvious manner, the ironic treatment of traditional dance forms was a favorite game with composers in the 1920's and one which may be exemplified by such pieces as the Polka from the Shostakovich Ballet *The Golden Age.* Here the humor lies in the dissonant and irrelevant harmonies applied to the familiar rhythms of a dance form which has become banal by repetition. It is the art of caricature applied to music, the distortion of a familiar profile. This factor of musical exaggeration may also be detected in music of earlier periods. We find it in the baroque fiorituri of the tenor who takes the role of the cantor in the *Hebrew School* of J. C. Seyfert. This is perhaps a vicious anti-Semitic jest in music, but it is pertinent to our topic because it pushes a real characteristic of certain songs of the Synagogue, a florid and highly ornamented melodic line, to the point of caricature. The same

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

quality reappears in the delightful aria from the *Marriage of Figaro* by Mozart in which Figaro demonstrates the life of a soldier to little Cherubino who promises to be a most unwilling recruit. This is set to martial music which is amusingly at variance with the stage picture.

Operatic music, from the earlier music in buffa style to more recent examples, owes its effect more to the dramatic situation, to tricks of delivery, to stage business than to musical humor of a specific kind. Composers in this style, however, learned to employ a bubbling, vivacious, and voluble style which is indeed the musical counterpart of verbal wit and which finds a classic expression in Figaro's air *Largo al factotum* from Rossini's *Barber of Seville*. This characteristic of volubility finds a characteristic expression in the patter song. A most amusing early example is the duet of the two lawyers from Lully's music to Moliére's *Monsieur de Pourceaugnac*. The pompous lawyer drones out a solemn succession of syllables in the bass while at the same time the voluble lawyer, the tenor, with breathless haste quotes every known legal authority. Devotees of the Gilbert and Sullivan operettas will recall other felicitous examples of the patter song besides the well known, "I am the very model of a modern major general."

Humor was not a salient characteristic of Wagner's genius. Where we do find it, as in the character of Beckmesser in the Mastersingers, it is marred by the almost sadistic completeness of the retribution which Wagner visits on the poor man. The treatment of the character throughout is in the vein of caricature. A charming and truly humorous effect occurs in the pantomime, in Act III, when Beckmesser enters Sachs's study. The orchestra quotes ruefully the melody of Beckmesser's unlucky serenade of the previous night and also the theme of the beating which the had suffered at the hands of the indignant David. Here we find a humorous use of the Wagnerian "leading motive."

Elsewhere in musical literature quotations frequently have the character of a riddle, the answer to which lies in the associations aroused by the title or the text of the tune. Sometimes the humor of quotation is musical as when Debussy quotes the opening bars of the Prelude to Tristan and Isolde in his *Golliwog's Cakewalk*, maliciously transforming the melancholy passion of the original into the sentimental idiom of the popular song. Sometimes the humor lies in factors associated with the music rather than in a purely musical effect. Thus Schumann's pointed reference to the Marseillaise in his *Faschingschwank aus Wien* is a joke at the expense of the censors who, though the performance of the tune was forbidden in Vienna, were unable to detect Schumann's rather obvious allusion to it. In the banqueting scene in Mozart's *Don Giovanni* the wind band on the stage quotes an air from Mozart's own *Marriage of Figaro*. Leporello comments tartly, "There's a tune I have heard only too often." Here we smile to hear Mozart disparage Mozart and at the same time neatly draw the attention of the audience to the enormous popularity which the *Marriage of Figaro* had enjoyed. In both of these cases the key to the jest lies in the associations of the tunes rather than in the music itself. —C.W.H.

**comic opera.** See opera.

**comic skit.** See RADIO DRAMA.

**command of hand.** See calligraphy.

**commedia dell' arte.** See THEATRE.

**commercial art.** Art subordinated and adapted to the uses of commerce, e.g. advertising layout, package design, bookjackets, decorative designs for wall papers and textiles, and magazine and calendar illustration. In the broadest sense includes interior design, industrial design (q.v.), and painting or sculpture executed primarily to meet the demands of a popular market. —L.D.L.

**common charges.** See HERALDRY.

**communion.** See MEDIEVAL MUSIC; Mass; Psalmody.

**comparative aesthetics.** See AESTHETIC INQUIRY, CURRENT TYPES OF.

**comparative musicology.** See MUSICOLOGY.

**compartment ceiling.** A ceiling divided into panels, sometimes deeply sunk or coffered and generally surrounded by mouldings.

**compass.** The drafting tool, compass or pair of compasses, has a long history and a regular utility in the studio of the painter and of other workers in the arts. In its simplest form, it was probably known from the earliest classical times. Similar to the compass is the proportional divider, used for laying off relative measures in scale. Sketches of this instrument are found among the notes of Leonardo da Vinci. —G.L.S

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

**complementary colors.** See COLOR.

**complementary color scheme.** See COLOR.

**component.** An element in a work of art, or in aesthetic form; one of the factors which, when interrelated, produce an artistic composition; one of the ingredients or means which the artist uses—not a physical means such as paint or marble, but a type of psychological experience which he aims to convey or arouse. Linear shape, color, and other attributes of visual perception are components in painting and other visual arts. Some components are simple or *elementary,* such as pitch and timbre in music; others complex or *developed,* such as melody, harmony, and counterpoint. —T.M.

**composite order.** An order developed by the Romans based on the Greek Corinthian. The principal variation was the adaptation of the large volutes of the Ionic order to the capital of the column. —O.M.S.

**composition** (L. *componere,* to put together). (1) The putting together and organizing of components in a work of art; or a product of such organization. There are four principal modes of composition: *utilitarian, representative, expository,* and *decorative* or *thematic.* (qq.v.). Four different types of factor in art result from these modes of composiiton; they may coexist (in varying proportion) within the same work of art. —T.M.

(2) To *compose* a dance is to give a movement form, as significant design, to what the mind has created. Composition is the way in which inner experience is brought into existence by technique, not only as skillfully executed movements, but also as an artful relating to these movements so that their organization results in a dance symbolizing unity between content and the form of its expression. See design. —M.N.H'D.

**compound fabrics.** See weaving.

**compound interval.** See interval.

**compound pier.** A pier consisting of a masonry core to which are applied or on which are clustered colonnettes, pilasters, etc., these applied members serving as supports for the arches and ribs of a vault.

**compound plain woven carpet.** See carpet structures.

**comprehensive plan, zoning.** See CIVIC PLANNING.

**concave relief.** See relief sculpture; negative carving.

**concentric.** Having the same center but not necessarily the same radii.

**concentus.** See accentus, concentus.

**concertante.** A display piece for two or more solo voices or instruments, with accompaniment.

**concertina.** See MUSICAL INSTRUMENTS.

**concertino.** (1) A small concerto. (2) The principal player.

**concerto.** A composition in sonata form for a solo instrument with orchestral accompaniment.

**concert overture.** See overture.

**conch shell.** See SYMBOLISM IN FAR EASTERN ART; MUSICAL INSTRUMENTS.

**concord.** *Mus.* Same as consonance (q.v.).

**concourse.** A large space usually enclosed which accommodates a large number of people, such as in a railroad station.

**concrete.** An artificial stone the usual ingredients of which are cement, sand and broken stone or other aggregate. When the ingredients are mixed with sufficient water the plastic mass may be poured into forms. The setting of the cement causes the mass to become hard. —O.M.S.

**conductus.** See MEDIEVAL MUSIC.

**cone.** Stack or funnel of kiln. See CERAMICS I.

**cone of vision.** See PERSPECTIVE.

**cones.** Clay pyrometric measures of heat, established by Seger. See CERAMICS I; also COLOR for reference to cones of the eye.

**confessio** (L.). *Eccl. Arch.* The crypt or shrine, or the part of the altar, or occasionally a large subterranean chapel in which the relics are placed.

**congo art.** See AFRICAN NEGRO ART.

**conical mound.** See Eastern North American Aboriginal Art.

**conical projection.** See PERSPECTIVE.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

**conjugate vanishing points.** See PERSPECTIVE.

**connoisseur** (F. *connaisseur,* formerly *connoisseur,* fr. OF. *conoisseor,* fr. *conoistre,* to know, fr. L. *cognoscere,* to become acquainted with). In art, one who has a trained and discriminating judgment of what is rare or choice, developed by the combination of historical knowledge of the art in question, practical understanding of its technical characteristics, and critical acumen in esthetic judgment. Connoisseurship may be described as the ideal goal of the historian of any art. See history of art. —L.D.L.

**consignatorium.** See EARLY CHRISTIAN ARCHITECTURE.

**console.** *Arch.* A projection or bracket for supporting a weight, usually formed of volutes or scrolls in an S-shape; a corbel.

**consonance, dissonance.** Antithetical terms designating the relatively small (consonance), or relatively high (dissonance) amount of tension which an interval between two simultaneously sounding tones has by virtue of the number of acoustical beats due to its vibration ratio. Since the octave is the only beatless interval, any boundary line between consonance and dissonance is arbitrary. Hence the principles according to which consonance and dissonance are treated in composition are a product of aesthetic consideration resulting from the assumptions of the idiom chosen. For practical purposes of contemporary composition, the intervals available in our tone system rank approximately as follows (from low to high tension degrees):

Perfect Fifth (Twelfth)
Major, minor Thirds (Tenths)
Major, minor Sixths
Perfect Fourth (Eleventh)
Diminished Fifth
Minor Seventh
Major Seventh
Major Second (Ninth)
Minor Second (Ninth)

In the equal temperament (q.v.) several intervals (e.g.: minor third and augmented second; diminished fifth and augmented fourth; minor seventh and augmented sixth, etc.) are acoustically equivalent. In the tonal idiom the equivalent intervals are distinguished in notation according to the harmonic functions which they represent in the particular context (see idiom, B.) In the atonal idiom (see idiom, C.) the notation is less relevant; the choice between different possibilities of notation depends on considerations of voice leading and of which version appears more convenient to the reader, viz. performer of the music. —E.K.

**consonant interval.** See interval.

**consort.** See chamber music.

**constancy.** See PSYCHOLOGY OF DRAWING AND PAINTING.

**constants.** See FRENCH ART.

**construction.** (art ed.) Work in the crafts, or industrial arts, where constructive activities are carried on; the translation of an idea into art form through building with materials such as wood, stone, metal, or clay; used in connection with grade project work of various kinds such as paper construction, sand table, model villages, etc. Whitford and Winslow in *Dictionary of Education.*

**constructivism.** Russian-French geometric-abstract movement in painting and sculpture founded by Naum Gabo and Antoine Pevsner in 1920 and flourishing during the 1920's. The movement included such artists as Moholy-Nagy, Lissitzky, Tatlin and Rodchenko. —L.D.L.

**constructivism ceramics.** See CERAMICS II.

**contemporary dance.** See modern dance.

**continental planning.** See CIVIC PLANNING.

**continuous kiln.** *Cer.* Kiln in which firing zone is continuously hot. See CERAMICS I.

**contour.** (F. *contour,* circuit, outline). The outline of a figure or body; the line that bounds.

**contour line.** In surveying: (1) A line joining points of equal elevation on a surface. (2) A line or level carried along the surface of a country or district at a uniform height above sea-level. —J.M.M.

**contour plowing.** See CIVIC PLANNING.

**contra bassoon.** See MUSICAL INSTRUMENTS.

**contrapposto** (It.) Opposition of contrasted masses.

**contrast.** Diversity of adjacent parts, as in color, tone, or emotion.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

**conventional.** Following conventions in respect of design, technique, or conception; formalized; conventionalized.

**conversation piece.** A kind of genre painting in which a group of figures is represented.

**cool colors.** See COLOR.

**copaiba balsam.** See oleoresin.

**Copenhagen ware.** See CERAMICS II.

**copies, imitations of contemporary paintings.** See FORGERIES IN PAINTING.

**coping.** The highest and covering course of masonry on a wall. The coping should be waterproof to preserve the interior of the wall from dampness, which in frosty weather might burst. —J.M.M.

**copla** (Sp.). See seguidilla.

**copper point.** Like the silver point, this was evidently much used as a drawing instrument in Western art and required, as did the other metal points, an abrasive ground in order to give it an effective line. —G.L.S.

**Coptic architecture.** The architecture of the Copts, principal Christian sect among the native Egyptians.

**coral.** See SYMBOLISM IN FAR EASTERN ART.

**corbel** (F. *corbel,* a raven, hence a beak-like projection). A block, as of stone or wood, projecting from a wall to support or help support a projecting feature. —J.M.M.

**corbel table.** A course of masonry projecting from a wall and supported by corbels which are often connected by arches.

**Corbie, school of.** See Carolingian art.

**corda** (It. string; Fr. *corde*). In piano scores, **una corde** is the direction to employ the soft pedal. **Due corde** (two strings) shifts the pedal only half way. **Tutte le corde** (all the strings) releases the performer from the use of the pedal. In violin playing, *due corde* calls for doubling of a note, which is performed on two strings simultaneously. **4me corde** means the G string; **3me corde,** the D string. —F.D.

**corduroy** (F. *corde du roi*). A cotton velvet corded or ribbed.

**core.** (1) The heart or innermost part of a thing. (2) In masonry: That part of the wall between opposite facing stones.

**Corinthian style.** The architectural style in which the Corinthian version of the Greek Ionic order is used; i.e., the Corinthian capital with two superimposed rows of acanthus leaves and tendrils ending in volutes at the top of the four corners is substituted for the Ionic volute capital; in Roman times, modillions are added to the soffit of the cornice and the ornament of all members of the order is greatly enriched. —L.T.S.

**Corinthian vases.** During the 7th and 6th cents. B.C., Corinth was a leading commercial center of the Mediterranean world. Among her chief industries was the fabrication and export of pottery. Her early vases show marked oriental influence, with carpet-like friezes of birds, animals, fish and flowers, and heraldic elements, including winged lions, sphinxes and griffins. In the 6th cent. these decorative elements were subordinated to mythological and genre scenes, including episodes from the potters' shops, mines and ships. Corinthian vases, robust in shape and vigorous in drawing, often show a lively feeling for color, with a cream background and figures in dark silhouette, varied by red, white and purple details. The quality of both clay and craftsmanship was not sufficient to meet the challenge which came from Athens in the late 6th cent., and Corinthian ware rapidly lost its vogue. —W.R.A.

**corners.** *Book.* The corners of books. Leather, vellum, etc., used to cover the corners in half and three-quarter bindings. Metal corners for the outside and slips of metal driven into the board to strengthen the corners. —H.E.S.

**cornet.** See MUSICAL INSTRUMENTS.

**cornetto curvo, diritto, mutto.** See MUSICAL INSTRUMENTS.

**cornfield hollers.** See AMERICAN NEGRO LITERATURE.

**cornice** (F. *corniche*). The course or courses of masonry at or near the top of a structure. The cornice often acts as a crowning feature and usually projects somewhat. —J.M.M.

**cornu.** See MUSICAL INSTRUMENTS.

**coromandel screen.** Coromandel is an uncommon term used for a certain type of large

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

inlaid screen made, in China, of calamander wood; thought perhaps to have come from the Coromandel Coast in India. —J.A.M.

**corona.** See tiara, papal.

**corps de ballet** (F. body or collective group; a company). A body of subordinate dancers, used as a visual choral background, against which soloists are framed, projected and contrasted. —L.K.

**correct drawing.** A term used by artist to denote specific information in terms of free-hand drawing. See drawing.

**corrente.** See courante.

**corridor.** A gallery or passage of a building, usually having various rooms opening upon it.

**Cosmati or Cosmato work.** The Cosmati were families of marble workers, sculptors and mosaicists who flourished in and around Rome from the late 12th to the early 14th cent. The names Cosmas or Cosmatus appear in several of these families. Thus, for instance, in 1210 Jacobus with his son Cosmas are mentioned by name in an inscription on the architrave of their chief work, the portico of the Cathedral of Cività Castellana near Rome. The Cosmati are typical representatives of Roman decorative art of that period which, starting from the production of church furniture and decoration in marble, gradually turned to more ambitious tasks, such as making sepulchral statues and perhaps also figured mosaics. Their name therefore is often used to designate Roman artistic activity of the time, esp. that of the 13th cent. In this sense, however, it is more exact to speak of **Marmorarii Romani** which is a medieval term. Several families of Marmorarii Romani, besides those of the Cosmati, are known. Most noteworthy are the Vassalletti, their principal work is the magnificent Cloisters of *S. Giovanni in Laterano* from ca. 1230-40. Most of the interior decoration and furniture of the early Christian and early medieval churches of Rome, with the exception of wall-mosaics, having perished, it is difficult to say how much the art of the Marmorarii of the 12th cent. owed to that of their predecessors. There is no doubt that in the general reawakening of Roman city-life in the period after the victory of the Gregorian Church reform, i.e., from ca. 1100 onward, Rome and the neighbouring regions experienced an artistic revival which manifested itself first in the equipment of older churches with pavements, chancels, ambons, altars, ciboria, cathedras, Easter-candles, sepulchres, porticos, facades and cloisters of a refined and elegant character; some of these works are unsurpassed examples of decorative art. That the artists took pride in their works is evident from the inscriptions with their names which are rarely lacking.

The chief characteristic of the new Opus Romanum is the combination of architectonic elements of classical and early Christian origin —i.e., columns, architraves, arches, gables, sarcophagi, etc., all made of marble—with a geometric ornamentation that makes use of mosaic technique. In the pavements it is the ancient **Opus Sectile** of variegated marbles that is used. The term **Opus Alexandrinum** for these pavements is misleading; the ancient Roman *Opus Alexandrinum* was a not clearly defined type of stone-mosaic, mentioned in *Histor. August. Alexander Severus*, 25, 7, as having been invented under that emperor, but perhaps rather originating from Alexandria. The patterns used in the Cosmati pavements seem to have been unknown to the Roman mosaicists of earlier centuries. They were evidently taken over from Byzantium (cf., e.g., the pavement from Hosios Lucas in Phocis illustrated in O. M. Dalton, *Byzantine Art and Archaeology*, 911, fig. 251), perhaps by way of Monte Cassino (for this whole complex problem see A. L. Frothingham, Jr., *American Journal of Archeology;* E. Scaccia-Scarafoni, in: *Bolletino d'Arte*, Series 3, vol. 30, 1936). The most important characteristics of the geometrical Cosmati ornamentation are circles, usually of porphyry or serpentine, and around them endless bands of marble. Especially in the decoration of church furniture we find an enrichment of the *Opus Sectile* by glass-paste mosaic of the same technical character as that used in the early Christian and Byzantine representational wall mosaics; interspersed with the ornament of marble and coloured stones there is a kaleidoscopic arrangement of small glass-paste cubes. Related to the Roman Cosmati decoration is that of southern Italian and Sicilian church furniture of the Norman and Hohenstaufen periods; yet in it we meet also strong evidence of Islamic ornament, including floral and animal motives.

In the 13th cent. the fame of the *Marmorarii Romani* spread far through Europe. In 1268 the pavement of the choir of Westminster Abbey, and probably before 1269 (see *Flores Historiarum*, ed. H. R. Luard, 3, 1890, 18 f.) the shrine of Edward the Confessor there were decorated in Cosmati work. It is probable that Petrus Civis Romanus whose

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

name occured in the shrine, was identical with Petrus Oderisii, the author of the sepulchre of Pope Clement IV in Viterbo (see below); Odericus, whose name once appeared in the Westminster pavement, was probably the father. Other parts of the pavement and several other tombs in Westminster Abbey are likewise made in the Roman style, some perhaps by English pupils of the Roman artists.

From the latter part of the 12th cent onwards the Marmorarii Romani ventured upon the decoration of their works by sculpture. In this they were never very original, but assimilated influences from southern Italy and Tuscany. Among their earliest works in sculpture are the reliefs of the Easter-candle in *S. Paolo fuori le mura* by Nicolaus de Angelo and Petrus Vassallettus. Probably after his return from England Petrus Oderisii made the first Roman sepulchre with a canopy and a recumbent statue of the deceased; it is the aforementioned tomb of Pope Clement IV in Viterbo which was begun between 1268 and 1271 (today located in the Church of S. Francesco). The artist's name is preserved by the 17th cent. *Acta Sanctorum* of the Bollandists (Propylaeum Maii, p. 55). The statue of the Pope is strangely alive and presupposes the influence of French and English Gothic sculpture. It is chiefly for this reason that it seems advisable to identify Petrus Oderisii with the Petrus Civis Romanus who made the shrine of Edward the Confessor in Westminster Abbey (cf. H. Keller, in: *Jahrbuch der Preussischen Kunstsammlungen* 56 [1935] 205 ff.). Later Cosmati tombs like that of Pope Hadrian V in S. Francesco of Viterbo and other sculptural works are influenced by Arnolfo di Cambio and perhaps also by the art of the Pisani. Some of the 13th cent. sepulchres of the *Marmorarii Romani* have representational mosaics on the wall under the canopy. It is possible that these are the work of the same masters who made the tombs. Similarly, the modest mosaics over a portal of the Cathedral of Cività Castellana and over the door of S. Tommaso in Formis in Rome may have been made by the Cosmati who did the portals themselves. See Pinzi, *Storia della Città di Viterbo,* 1887-89; Cristofori, *Le Tombe dei Papi in Viterbo,* 1887; A. L. Frotingham, Jr., in: *The American Journal of Archeology* 7, 1891, 38 ff.; also ibidem: 10, 1895, 152 ff.; G. Clausse, *Les marbriers romains,* 1897; G. Giovannoni, *Archivio della R. Società Romana di Storia Patria,* 1904, *L'Arte,* 1908, and *Enciclopedia Italiana* 11, 1931, 576 ff.; G. Swarzenski in Thieme-Becker, *Allgemeines Lexikon der bildenden Künste,* 7, 1912, 505 ff.; P. Toesca, *Storia dell Arte Italiana,* 1, 1927, 583 ff. and 826 ff.; G. A. Sartorio, *I Marmorari Romani nella chiesa di Westminster Abbey,* 1896; W. R. Lethaby, *Westminster Abbey and the King's Craftsmen,* 1906 and *Westminster Abbey Re-Examined,* 1925. —G.B.L.

**costumbrista literature.** See HISPANIC AMERICAN LITERATURE.

**COSTUME ART.** The purpose of these brief paragraphs is merely to indicate the scope of costume as human dress, worn for protection from the elements and from injury, or for propitiation and attraction. The subject is inevitably bound up with ethnology, pre-history and the history of all civilizations. The intention here is to suggest the allied fields where material can be found, and facilitate research depending on the angle or interest of the reader.

Among the first impulses of man has been the need to cover himself and to adorn himself. His creative instinct has led him to invent tools and techniques to accomplish this, using whatever materials he found at hand. Among his earliest inventions were the pin, the needle and the loom. Among the earliest materials used were skins, plant and animal fibers.

For the purpose of this article, the term *costume* includes every type of covering of the human form, no matter what the medium; elsewhere differentiation is made between clothing and costume, the latter implying characteristics or style.

Pre-history has left records of the bone pin, the eyed needle, and woven fibres; examples of the last are found in fragments remaining from the Hopewell culture (q.v.).

The first garments were skins of wild beasts wrapped around the body or limbs with thongs, later cut and sewed with thongs or fibres. Fibres and barks of trees pounded into cloth and, after the invention of the loom, strips of woven fibres were wrapped around the body.

These and other early techniques have survived among primitive peoples in various parts of the world. Invention and skill in using material at hand—shells, seeds, bone, grasses and numbers of other fibres besides skins of animals and fish, wool, hair, quills, feathers, minerals and metals, have been limited only by the imagination and craft of the artisan and instinct to create for adornment

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

as well as need for protection. Examples of these skills can be found in ethnological departments of museums as well as in the jungles, icebound regions, seacoasts, mountains and other parts of the world where non-industrial cultures still exist.

Objects that are included in costume and costume accessories are tunics, shirts, cloaks, trousers, skirts or any garment to cover the body, foot coverings, headdresses, masks, earlaps, mittens and gloves, shawls, kerchiefs, girdles, garters, jewelry, pouches, bags, fans, parasols and any other object worn to adorn or protect, as well as skin painting, tattooing and "make-up" of all kinds.

In some instances costume has been conceived to enhance the human form, in others to conceal it. A theory exists that costume developed from man's instinct of modesty; another, that it grew entirely from climatic conditions—that in warm climates the skirt was used, and in cold, the trouser. These and other theories are difficult to prove because of obvious exceptions and the lack of exact data.

Early civilizations developed costume to a high art, according to what remains to us of objects unearthed or recorded on stone, pottery or painted documents. In Ur of the Chaldees, fringed and decorated garments are clearly indicated on stelae, and intricately fashioned jewels have been found intact in grave mounds. The Egyptians' skill in finely woven cotton and linen robes has been preserved in papyri, in wall paintings, sculpture and in mummy wrappings, along with necklaces, bracelets, hair ornaments and other adornments. Pre-Columbian robes, caps, headbands, and jewelry have been taken from sites in Peru and other Latin American countries. Source material for the study of costume of early civilizations can also be found on the stone, metal or painted records of Mesopotamia, Persepolis, Ajunta Caves, Chichén-Itzá, Luristan and in growing collections of the arts of peoples long buried and recovered by archaeological research and excavation, and are available for study in museums throughout the world. Sculpture, pottery, textiles, paintings, manuscripts are the handbooks that provide authentic information regarding the methods and styles of dress prevalent during past eras, and can be considered by the student of costume as the Godey Books of those times.

Notwithstanding this wealth of material, it is difficult to reconstruct a complete visual picture from description or two dimensional sketches or cuts. To understand the shapes and lines it is advisable wherever possible to investigate a garment at first hand. Such an investigation may prove not only inspirational to creative design but may help to determine the derivation of certain characteristics of garments; i.e., the slit in the modern man's coat which seems to carry down from the days when swords were worn. The cut of a traditional Palestinian robe, with its long pointed sleeve, may suggest the lines of a medieval dress for which it may have been the model in Crusader days. A well tailored Persian coat from the court of Shah Abas may have carried suggestions for European men's dress.

It seems to be a rule in most countries that social status or wealth is indicated by richness of material, color and elaborateness of decoration. Royalty wherever found wears not only a crown but other insignia of rank or position. Regal purple or imperial yellow furnish familiar examples, while green in the turban of a Mohammedan shows that he is descended from the Prophet or has made the pilgrimage to Mecca.

The **headcovering**, hair arrangement, or other typical ornament, often tell whether a woman is married or unmarried. In Japan, a different haircomb was used for each stage of a girl's development; these styles were also reflected in the design and brightness of color of the kimono. In Jugo-Slavia, studies have been made which show that certain embroidered patterns indicate if a widow, how many children she has, and even if she is open to remarriage.

**Clothes** are a fertile field for the study of symbolism and even calligraphy. They are among the first objects on which traditional designs are recorded, woven, stitched or painted. Basic nature symbols such as the sun wheel, the tree of life, are found in cultures as far apart as the American Indian, Mesapotamian, Ancient Greek. Beautiful script has been woven into garments by the Copts of Egypt and the Persians.

Special costume has been created by every people for their rituals. To propitiate their deity the finest craftsmanship is lavished on the garments worn for worship in all epochs. High priests, medicine men, holy Lamas of Thibet, punkis of Burma, Shamans of Central Asia, the Ethiopian prelates, whirling dervishes, wear some distinctive apparel or ceremonial garments. The habits of religious orders and sects—Christian, Buddhist, Mohammedan, Hebrew—form a detailed study in

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

themselves, as do the vestments worn to celebrate masses, feasts, pilgrimages, and other religious observances. Symbolism enters into the methods of tying knots, bows, turbans and countless other arrangements of garments. The **tablitas** (high wooden headdresses) and masks worn in Pueblo Indian dances are no less creations of art than the magnificent brocaded church vestments.

**Bridals**, which are basically rituals of fertility, have always been distinguished by the care and workmanship expended on the robes and ornaments, and the modern bridal dress is no exception.

**Burial robes** and colors associated with mourning vary from the Biblical sackcloth and the white shroud to the rich trappings with which early Eastern people surrounded their dead on the journey to the after life.

The islanders of the Pacific spared no pains or fantasy on their elaborate headdresses, masks and ornaments, or in celebrating their rituals, as the magnificent collections in museums here and abroad testify.

The abstract art of African ritual **masks** has long been disclosed to us, while Guatemala, Mexico and other countries still furnish fertile fields for study of this form of folk expression still in use. Animals and birds are often models for masks, abstracted to suggest particular characteristics. Natural phenomena such as sun rays, thunderbolts, rain, are freely represented.

In Central Europe, in Russia, indeed in all countries where traditional costume is still in use, feast days are made particularly gorgeous by the addition of brilliantly embroidered shawls, scarfs, petticoats, shirts, jewels, footwear and headgear. Flowered ribbons, gay kerchiefs, feathered and beaded trimmings are often added to honor a seasonal celebration or saint's day ceremony.

It is hard to differentiate between **ritual** and **theatrical costume** because the theatre has had its roots in ritual and in many parts of the world is still a religious ceremonial.

In Mohammedan countries formal theatre has never developed but in such pageantry as the Passion Play of Kerbela, and in pilgrimages like Nebbi Mussah in Palestine, the usual handsome **abas** (coats) and turbans give suitable theatrical effect to the ecstatic sword dances and other devout practices.

In the Japanese No (ritual dramas) the handsomely woven and designed kimonos and carved wooden masks, the latter often signed sculptured works, are handed down like the acting convention itself. Gold tissue and heavy silk, tassels and cords whose red earth colors must not be confused when tied with the white heavenly section, are as rigidly prescribed as the gestures, language and vocalization.

In Indonesia costume for performance challenges the intricate technique and skill of the actors or dancers as they are called. The sarong is elaborate in design and trains, demanding art to manipulate gracefully. In Bali the torso is tightly bound with many yards of brocaded sash while a velvet jacket ornamented with perforated leather shoulder pieces is used in Java.

The Chinese theatre has developed a convention of its own; each class of characters is designated by a typical costume and make-up, such as the pheasant feather headdress of the military man and the long waistcoat over tight jacket and sash of the servant. "Make-ups" as elaborate as masks from which they were probably derived, are an essential part of the Chinese stage.

The theatrical clothes of Europe are familiar. Those worn in the mysteries and miracles were probably church and lay robes of the period, and are undoubtedly recorded on portals and other Medieval sculpture. Secular plays, the Comedia del Arte, and the masques, developed their own styles so vividly portrayed by Callot, Watteau and others.

As is well known the Shakespearean theatre used only the dress of the day. Painting and other documents reveal that in the later centuries there appeared elaborate costumes for ballets, operas and spectacles of all kinds that flourished under the Louis and the Charles, and in the luxurious courts of Italy, Vienna and Spain.

In more recent times costume for the stage reproduced the fashion of the day and of the specific characters represented. In the first quarter of the 20th cent. a new angle on theatre costume appeared. Designers conceived dress as part of the decorative ensemble, and strove to clothe each character to add atmosphere and express its psychological relation to the play in color, in line; to take costume out of the photographic state it had reached in the 19th cent. and again endow it with a certain theatrical convention. Developed lighting systems and other stage mechanics permitted treatments and handling of materials from a new and perhaps more imaginative perspective. In this day theatrical costume has sometimes become the inspiration for fashion.

**Battle dress** has in certain epochs called forth the greatest art and craftsmanship, not only in the finely wrought arms and chain

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

mail of the Crusaders, but in the greaves, helmets, breastplates of the warriors of all ages and countries, and the warbonnets and trappings of tribesmen of all continents. To protect the body or limbs, to strike terror in or impress the enemy, to propitiate the gods of war or fellow countrymen, these battle costumes often have been wrought with the care and skill of the goldsmiths and were as highly prized as jewels. Modern warfare has transformed battle dress from display to concealment; the paratrooper's uniform has been devised to meet this need.

**Occupational costumes** seem to have developed as communities have become more and more complex. Shepherds, artisans, tillers of the soil have usually required certain types of garments as part of their work. In the Hungarian mountains a sheepskin coat is as necessary as a grass raincoat to a Mexican peon, or the waterproofed protective garments of fishermen on open seas.

As urban communities grew and occupations became differentiated in European countries, the butcher, the baker, and the candlestick maker each adopted his own style of dress, just as certain recognized professions—doctors, judges, civil officials, even jesters—had previously done.

Today occupational costumes are so numerous and functional as to seem commonplace, and generally are worn only during hours of work.

**Footwear** has called forth variations from the delicate classic sandals of infinite design to bark wrappings worn on the Russian Steppes; from the knitted sock to the slipper, the boot, the patten in all their ramifications.

**Fastenings** for these and other apparel have included lacings, thongs, straps, buckles and buttons, antedating the zipper which came into practical use in the 1920's.

**Headdresses** have been even more diverse as many peoples who never protected their feet, conceived plumage for the head to vie with Nature's efforts for the birds. Also like the birds, the males have usually carried this method of attraction even further than the females. Brilliantly hued feather pre-Columbian headdresses as well as robes, the delicate kingfisher and pearl crowns of Imperial Chinese, the ostrich plumed felt hats of swashbuckling cavaliers, the fabulous turbans of Turkish potentates, are merely a few examples of how man has taken a cue from nature. The haircomb both in itself and combined with stuffs and superimposed ornaments, is an intricate but intrinsic feature of headdress.

Jewelry, fans, bags, kerchiefs, parasols, gloves, veils, or what we term accessories, could each fill its own chapter (see JEWELRY).

Metal antecedents of the safety pin, fibulae of the Celts, nose-rings of the savages and the modern jeweled clip run the gamut of time and place. Unknown Cellinis have spent their art on delicately wrought breastplates, girdles, hair ornaments and rings for church and state; amulets have played important roles in life and death, in history and in legend.

The **veil** has had connotations with the most feminine qualities, both secular and religious. In only a rare instance, such as the Tuareg tribe, has it been associated with men. The fan is more than an implement to circulate air. It has symbolized rank, profession, joy, sorrow.

The parasol has not only functioned as a sunshade but has served in ritual. The glove, the bag, the kerchief have each evolved in form, design and purpose according to the fantasy and need of the generation or of geography.

**Underwear,** corsets, hoops, farthingales, bustles, have taken on as many changes as outer apparel and indeed have been devised to meet the requirements of a desired silhouette just as the style of a building is determined by its foundations. The nightcap and gown, the dressing gown, the pantelette and petticoat have appeared and disappeared according to the taste of an epoch.

**Sportswear** is fairly modern, although the falconer's glove and the hunting jerkin must have had their parallels in pre-Christian centuries. The Persian polo players and Parthian and other hunters seem to have worn their customary attire. The 18th cent. man's hunting clothes have come down to us in the traditional "pink coat", and peaked "jockey cap". Ladies' voluminous riding habits became more trim and practical with each generation until the side saddle and pommel went out of general use, and close fitting breeches became customary with the growing freedom of women. Fencing, badminton, tennis, golf, bathing, skating, ski-ing, camping, bicycling, motor driving and other sports developed special clothing in accordance with the basic styles of each generation, and their players' need for protection and ease of movement. Cricket, football, baseball and track suits are a late and strictly western innovation.

**Make-up,** the modern vanity case and lipstick have their antecedents in early times. Egyptian ladies and women of many remote

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

civilizations knew and used kohl to attract attention to the eyes, which were often the only features visible to others than their immediate families. Henna preceded present day nail lacquers, and was not restricted to fingers, but also dyed the heels, soles and palms. Oils, unguents and perfumes were almost universally used in the East and eventually found their way to Europe. Elaborate make-up kits have survived many centuries.

But not only among highly cultured peoples has make-up been used to attract. A stippled face is part of the costume of the sturdy Tibetan women who enjoy the responsibilities and privileges of a polyandric state, and war paint is a familiar method used by tribesmen to terrify their enemies. Modern camouflage is a reverse, though related, use of this technique.

**Tattooing**, in some regions considered as adornment, is often a ritual. Boys at puberty are initiated into certain tribes by this painful operation. Tattooing as decoration of the person still seems to have an appeal for sailors, circus performers and other "he-men".

The costume art of one civilization has greatly influenced that of others. Since the 18th cent. France has been considered the fountain-head for the dress of Europeans and Americans in urban communities. Only in the last generations have men's clothes taken their cut from England. It is not alone in modern times that styles have been borrowed. Greece, the France of the Classic World, spread its design far and wide over Asia Minor, the Black Sea and all lands touching the Mediterranean, while the aesthetics of Iran reached far into Turkestan, as can be noted in the excavations of the caves at Turfan.

The Crusaders may have brought back from the east the wimple, the tall headdress and veil which took on many forms during the medieval period.

The Indians of Latin America stitched and wove into their garments designs brought by their Spanish conquerors. In Panama even the full belaced and beruffled skirt combine the traditions of Spanish women with the fantasy of native ornament.

In the Balkan countries reminiscences of Turkish domination are apparent in richly embroidered shirts, jackets, tunics, aprons, and veils. Metal threads, sequins and coins prized by Eastern peoples are profusely used to emphasize patterns or fringe the edges of caps, sashes, etc., and in many instances the full Turkish trouser, short sleeveless jacket, diaphanous veil and upturned scimitar-shaped slipper were retained.

The Visigoths seem to have registered their descent on Spain in the cross-stitched and smocked linen shirts and heavily woven mantles bordered with strong geometric designs and crowned with hoods terminating in almost architectural patterns which as late as 1930 were still worn in the province of Zamora, and are probably still worn today.

Like language, many of these designs became traditional in the land of their adoption, and origins have become clouded in usage and in legend.

Design in modern costume or fashion has taken on a personal character, as well as expressing the psychology and life of a generation or an epoch. Names such as Worth, Poiret, Redfern, are inevitably connected with the dress of the 1890's, and first quarter of the 20th cent. The next decades saw other French designers emerge and at the present writing (1943) American designers' personal interpretations are being recognized as distinctly as a canvas bears the signature of the painter.

Since the introduction of the sewing machine and mass production, the art of costume has become paradoxically simpler and yet more complex, and is inevitably bound up with problems of industry. The motion picture too, has had a widespread influence in democratizing clothes and wiping out class distinctions. The farmer's wife wishes now to be dressed in the latest style worn by a favorite Hollywood star. She can shop through a mail order catalogue and acquire the newest model by a creative artist, or she herself can cut it from an easily available pattern, using perhaps a gay print which now replaces the unbleached flour sack.

Reversely, the blue jean formerly identified with the cowshed and the mine has swept to the four corners of the world and earned its place as a costume practical for most out-of-door work, play and factory labor.

All wars have dictated radical changes in costume, notably the French Revolution which brought a new social order and therefore a leveling of classes reflected in simplified and more universal styles of dress: man discarded frills and furbelows, adopted the trouser; woman sheathed the body instead of encasing it in countless rigid stuffs and grotesqueries prevalent in the 17th and 18th cents.

World War II has also precipitated upheavals and readjustments in those arts and industries related to fashion. Since World War II, designers in America and England are

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

turning inward for their creative inspiration and also directly to the same historical and traditional sources that French designers formerly sought.

The limitations imposed by the U. S. War Prod. Board to conserve materials vital to the war effort, present a challenge to the ingenuity of designers which artists and craftsmen in costume have always faced in some form. As a result of experimentation required by war needs, a rebirth of creative design can be anticipated. New combinations of the natural and synthetic fibres, dyes, and media may be released after the war that may lead to a flowering of style to which easier intercommunication and understanding may be contributing factors.

The above paragraphs may emphasize the fact that costume is deeply enmeshed with other arts and sciences. In portraiture and in decorative painting artists have been as concerned with the textures and lines of the clothes as with the features. Sculptors, too, have often faithfully reproduced the wearing apparel of their day on pediments, stairways, capitals, busts and tombs. Art historians and archeologists turn to costume to identify the date of a particular work and to trace its origin. The crown of a King portrayed on coin or seal may give the sought-for evidence. The novelist, the journalist, the dramatist, turn to costume to verify atmosphere and history. The chemist also turns to costume to analyze and compare dyes, and the ethnologist finds much data in tracing customs and intermingling of cultures.

Functionally and decoratively, in every climate, arctic or subtropical, under all conditions and evolutions, in primitive states and in highly developed communities, man's ingenuity to protect and adorn himself has met every test. In no art has his genius for proportion and design shown itself more fertile.

Modern industry may provide ease and speed in meeting the need for clothes, but may add little to the level of beauty that has already been embodied in the garments of bygone eras and far flung civilizations. However, inspiration can be derived from a study of the past that may stimulate the creation of new skills, new designs, new avenues, to carry forward the art of costume into a world of the future and a way of life still unveiled. **costume jewelry.** See JEWELRY.

**cotton.** According to records unearthed in the ruins of the city of Mohenjo-dara in the Indus Valley of India, cotton cultivation and manufacture were pursued there as early as 3000 B. C. Definite information is to be found in the law books of Manu, 800-700 B.C. which show that cotton cultivation and conversion had long been established in India. The ancient costumes of India were draped

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

and uncut. This single piece is called a **sari** and is usually decorated on the edges and at both ends. The **sari** forms a whole costume when draped by the Indian women.

Indo-Greek statuary of the 1st and 2nd cents. A.D. and the images of Buddha so evidently inspired by the Athenian statues, show an individual rendering of drapery. It is evident that the artist was familiar with the gossamer (cotton) muslins of India for which Dacca was once famous.

The lightness of **Dacca muslin** is made possible because of the long fine cotton yarn grown in the Indus Valley. In the 17th cent. we find a record of fabrics 15 yards long and one yard wide, of such incredible lightness as to weigh only 60 grains to the square yard—or 73 yards to the pound. (The lightest fabric made by a Swiss hand loom averages 16½ or 17 yeards to the pound.) This finest of cotton was sometimes called ***mul mulkhas***— evening dew. These muslins were as precious as some of the finer rugs of Persia, being reserved for royal usage as gifts to friendly courts and for religious purposes. It is safe to say that the muslins of Dacca were the most delicate cotton fabrics ever fashioned in a loom. The spinning wheel was never used to spin these yarns (for the method of spinning see *The Heritage of Cotton,* D.M.C. Crawford, page 68.)

Few actual specimens of cotton from India date before the 16th cent. A great collection of Indian cottons in the Brooklyn Museum are early 17 cent. pieces from the ruined city of Amber. These are wall hangings representing English ambassadors in the costume of James First of England. One represents the sacred cotton plant of India which has large purple blossoms.

It was not until 400-300 B. C. that knowledge of cotton reached Europe through the writings of Herodotus and the chroniclers of the campaigns of Alexander the Great. Greek writers called cotton "tree wool."

In the records of the Byzantine Emperor Justinian appear the two words carbassa (meaning cotton yarn) and carbasum (meaning cotton fabrics), adaptations of the Sanskrit word for cotton, *karpasi.*

By 70 B.C. the Romans were reported to be using cotton, presumably imported from India over the Arabian trade routes, in tents, awnings and canopies. In 70 A.D. Pliny reported cotton cultivation and manufacture fairly extensive in upper Egypt.

Cotton growing and manufacture, however, did not gain a firm foothold on the continent of Europe until 912-916 A.D. when it became established in Spain under the Moors and in Sicily while that island was under Arab rule. Its European penetration was confined for the most part to those two countries until the Crusades brought to the attention of the north and west of Europe the Levantine cottons. For a time cotton growing and manufacture flourished in the Crusader states in Asia Minor and a lively trade between these states and the Italian city states developed.

Cotton appears to have made its appearance in England in the latter part of the 12th cent. when it was used as candle wicks, embroidery yarns and for mixture with flax and wool in the heavy cheaper fabrics of the poorer classes. It also became known about the same time in France and Flanders, but these countries failed to acquire the skill in its conversion, required to compete with the fabrics made in Asia until many years later.

The growth of cotton manufacture of Europe, however, was far from impressive by modern standards until late in the 18th cent. when Manchester and Bolton began to acquire fame for their cotton and linen manufactories. It was in that period that Arkwright invented the spinning frame. Crompton invented the spinning mule, and Cartwright invented the power loom and the machine age really got underway. In 1793 Eli Whitney invented the cotton gin. The effect of this was instantaneous and combined with the inventions of the Lancashire spinners and weavers gave the English speaking world a dominance in cotton growing and manufacture that went almost unchallenged for 150 years.

When Columbus landed in the Bahamas in 1492, he found the natives wearing cotton garments and it was partly this that led him to conclude that he had reached the Indies. Researches in recent years have disclosed that cotton cultivation had been known in the New World for many centuries prior to its discovery and there are fairly sound reasons for the belief that it was in use in pre-Inca times in Peru or as early as 200 B.C.

More than a thousand major uses for cotton are known and it is estimated 99 per cent of the world population uses cotton in one form or another. In addition to supplying innumerable articles of clothing and home furnishings such as sheets, blankets, mattresses, towels, wash cloths, draperies, upholstery, slip covers and rugs, cotton also is used in large quantities for bandage. As a base for explosives, it is essential in war, mining, road

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

building and agriculture. There is in the course of development the use of cotton in pre-fabricated low-cost houses. —G.W.R.

**cotton weave.** See weaving.

**coulé.** *Mus.* A slow appogiatura (q.v.).

**coulisse.** See STAGESETTING.

**count.** Number of warp and filling threads per inch. Also diameter of yarn, largely worsted.

**counterpoint.** Set of principles concerning the intervals formed by two or more simultaneously presented melodic lines at any given point, to be obeyed in order to make the simultaneous presentation of such lines aesthetically meaningful in terms of the idiom chosen for the composition under consideration (see polyphony). *Educationally*: The discipline setting forth the principles of counterpoint. ***Double counterpoint.*** Set of rules to be obeyed in order to allow that a melodic line originally written as a lower, or upper, part in relation to another line be transposed by a given interval whereby it becomes an upper, resp. lower, part in relation to the other line, without violating the contrapuntal principles in validity; concretely speaking, the intervals between the original parts must be considered with respect to what becomes of them after the transposition of the movable part. The interval by which the movable part is transposed in order to change its relation to the stationary part specifies the kind of double counterpoint (e.g., double counterpoint of the octave, of the tenth, etc.). —E.K.

**Counter-reformation.** The reaction of the Catholic Church to and its reorganization in the face of the Protestant Reformation; a movement which arose in the second quarter of the 16th cent., gained its greatest intensity in the second half and its greatest outer momentum in the 17th cent. Its central manifestation was the council of Trent which formulated it dogma.

In the 16th cent. the attitude of the Counter-Reformation towards art was mainly one of encouragement, but restraint; encouragement, since the value of art had to be upheld against iconoclastic trends in Protestantism; restraint, since the new orthodoxy, set as it was against the worldliness of the Renaissance, found it impossible to tolerate anything heretic, superfluous, indecent or Pagan. Hence the frequent interference of the ecclesiastic authorities in matters artistic. The positive contributions of the Counter-Reformation to art were slower in coming and arrived at full fruition only during the baroque (q.v.). Apart from liturgical and iconographic innovations they were mostly connected with the new conception of art as a means of propaganda, to be used at best advantage in the effort to hold wavering souls, to reconquer lost and to gain new human territory. Art played its part in that program by virtue of its sensuous appeal to emotion; for no matter what their integrity of purpose, it was believed by leading personalities of the age (the Jesuits!) that the church could save great numbers of human souls only if she came to terms with empirical conditions of collective and individual psychology. Consequently, art came to be used as a means of impressing the community by the exploitation of extreme emotional situations: death, mystical ecstasy and the torture of martyrdom. Instead of educating the beholder as the art of the Middle Ages had done, the art of the Counter-Reformation meant to surprise, fascinate, elate or terrify him. By thus playing upon his sensibilities it discovered new powerful effects, but it lost much of the integrity and reticence of an earlier day. —R.B.

**country dance.** This name designates a particular type of English national dance. The origin of the country dance has been hotly disputed, some authorities arguing that the name and the formations used prove descend from the contre-danses of Europe, introduced to England by the Normans. Others insist that dances of this type existed in England long before the Norman Conquest. This latter view is more generally accepted at present. The country dances were usually danced by couples in two lines facing each other and progressed through many figures, returning often to the original formation. The basic step was a light, springing run, performed with easy elegance. Accompaniment was by bagpipe, fiddle, or pipe and tabor in 2/4, 4/4, or 6/8 meter. See American folk forms, in music. —J.G.

**country park.** See CIVIC PLANNING.

**country planning.** See CIVIC PLANNING.

**country singing.** See American folk forms, in music.

**counts of yarn.** Yarns are graded by the number of rubs, cuts, hanks, or yards required to make one pound. —G.W.R.

**county planning.** See CIVIC PLANNING.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

**courante.** As background for its existence at 16th and 17th cent. European court festivities, the courante had an ancient life among the people in both Italy and France. Both nations claim the dance, but apparently the similar forms had parallel origins—not an unusual or unnatural occurrence for a dance based on so fundamental an activity as runnnig. In both the Italian **corrente** and the French **courante, or branle of poitou,** as it was originally called, the dancers used a springing run characterized by a bouncing action of the knees. The figures made short advances and retreats with sudden changes of direction. The fast ¾ beat was subdivided into eighths in an accompaniment that followed the running movement. The branle of poitou, slower than the corrente, was the form adopted by the French court and traditionally incorporated a flirtation pantomine. The second movement of German musical suites took its name and form from this dance, with the result that the courante is classified as a pre-classic dance. —J.G.

**course.** In masonry: Arrow of stones of the same height, generally placed on a level bed.

**coursed or range work.** Term applied to masonry in which stone is laid with continuous horizontal joints.

**coursing joint.** In masonry: The joint between two courses of stone.

**court.** An open area within or surrounded by a building with its wings.

**cove.** *Arch.* A concave molding; a member, as a ceiling, whose section is a concave curve. *v. t.* & *i.* To arch over.

**covers bound in.** *Book.* The original covers bound in rebinding.

**crab canon.** See canon.

**cracker box philosopher.** See American folk forms, in literature.

**crackle.** Minute cracks often seen in the glaze of Oriental pottery. See also FORGERIES IN PAINTINGS.

**cracoviac.** A national dance of Poland, taking its name from the city of Cracow. It is a round dance performed by couples in a large circle. Partners dance close together in a position similar to that of modern social dance. The figures consist of a leaping waltz-balance in place, alternating with a polka step or vigorous waltz-galop moving around the circle. Since it is in 2/4 meter, the dance seems more closely related to the polka than to the waltz. Sometimes all the steps are done with exaggerated springs into the air, stamping, and rapid whirling. —J.G.

**Cracow renaissance.** See POLISH ART.

**Cracow workshops.** See POLISH ART.

**cradle.** During the 19th cent. a common reparative appliance for wooden panel paintings was a system of strips attached to the reverse, known as a cradle. The purpose of this was to hold the panel without warping and, when well made, the cradle contained loose or sliding members which ran at right angles to the grain of the wood. These were held in by slots in longitudinal members that were joined to the panel proper. In practice, the effectiveness of the cradle has been open to much question, and it is less used now than formerly. See RESTORATION OF PAINTINGS. —G.L.S.

**craft** (As *crafts* strength, skill, cunning). In art, (1) skill, dexterity, or aptitude of manual or technical character in contrast to esthetic aptitude. (2) Those engaged in art or a branch of art taken collectively, e.g. a craft or guild of stonemasons, painters, goldsmiths, etc. (3) A handcraft, or work of art accomplished by the skill or cunning of the hand of a trained individual using simple tools, contrasting with the industrial art of mass production by machine, on the one hand, and with the fine arts of drawing, oil, fresco, water color, and tempera painting, design, sculpture, etching, and lithography, on the other. Typical crafts or handcrafts include wood-block printing, leather work, metal work and jewelry, bookbinding, weaving, ceramics, and other varieties of applied design in which each object is a unique product. —L.D.L.

**crane.** See SYMBOLISM IN FAR EASTERN ART.

**craquelé** (Fr.). See crackle.

**craqueluré** (Fr.). Cracking, as of varnish, color, or enamel, on a work of plastic art.

**crater.** A bowl used by the Greeks for mixing wine and water, with a large body, wide mouth, and handles on either side. Craters of gold and silver were mentioned in the Homeric poems. Among the most beautiful pottery shapes are the massive Corinthian craters with column handles enclosing the

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

neck, the so-called Francois vase, an Athenian crater dating about 560 B.C., decorated with neat bands of silhouettes in black glaze representing scenes from mythology, the finely proportioned Chalcidian craters with slim curved handles, calyx craters made in Athens in the middle of the 5th cent. B.C., shaped like the opening calyx of a flower, and a very graceful elongated Athenian type with slim body, narrow neck, and long handles. In the 4th cent. B.C., two more florid and less attractive shapes became popular in Italiot Greece, the volute-crater in Apulia and the bell-crater in Leucania. The volute-crater was distinguished by an egg-shaped body, broad neck, and large volute handles rising high above the lip; ornate paintings on the sides represented sentimental scenes with technical skill but little sense of design. Bell-craters were so named because their shape was that of an inverted bell. —W.R.A.

**crawling.** Running or creeping of glaze leaving parts unglazed. See CERAMICS I.

**crayon.** Any small stick made for drawing can be called by this name. It usually designates a combination of pigments or dyes in a wax medium, formed into a thin cylindrical shape. A few crayons contain water-soluble dyes. A kind of crayon has been made by cooking charcoal in linseed oil. As tools for the draftsman, they are said to have come into use in the 16th cent. and are found in drawings of that time and later. —G.L.S.

**crazing.** Glaze fractures caused by greater contraction of glaze than body. See CERAMICS I; crackle.

**creative dance** is any dance experience in which the mind of the dancer is permitted to organize and endow its material with a specific structure and individuality that is its own. With the imagination it combines impressions creating new images out of past experience; with the will and energy the new images are executed and given an observable form. —M.N.H'D.

**creative experience.** (art ed.). (1) That phase of the art experience characterized by actual application of art techniques and the making of original art products, rather than by examining, studying, and appreciating works of art; (2) that phase of the art experience characterized by the production of original art forms, rather than copied or imitated forms. Whitford and Winslow in *Dictionary of Education.*

**credence.** See FURNITURE.

**credo.** See Mass.

**creeper.** See crocket.

**crenelated.** Furnished with battlements.

**crepe.** Fabric containing hard twisted yarns and forming a pebbly surface character. A crinkled fabric. Produced in various ways.

**crescendo.** Increase in tone volume, gradual transition of musical dynamics; opposite **decrescendo.** Both have been employed for centuries as a generally accepted device in vocal and also in instrumental rendition. However, in orchestral performance, the crescendo-decrescendo technique took on special significance with the 18th cent. Mannheim school. See NOTATION. —F.D.

**crest.** See HERALDY.

**Cretan-Minoan.** During the period from the middle of the 4th millenium B.C. to about 1200 B.C., the island of Crete developed a highly original and productive artistic culture. Archeological excavations begun by Sir Arthur Evans in 1900 have revealed that this civilization, the dominant commercial power of the eastern Mediterranean, was devoted to gay and luxurious living in which the artist played an important part. The architecture of the palace of the Minoan dynasty at Knossus was intricate in design, with scores of rooms, including a reception hall, royal apartments, chapels, a theatre and store-rooms, built in several stories about a central court. The broad stairways enclosed light-wells, and the system of plumbing was elaborate and effective. The palaces in Crete were liberally decorated with fresco paintings in bold color, including lively scenes of boys and girls in acrobatic games, gathering flowers, or serving at religious rites, and of animals, fish, and floral scenes, done in a wide gamut of clear color (red, blue, green, yellow, black, white and gold); the painting shows astonishingly accurate observation of nature, verve, and feeling for flowing rhythm. The products of the vase-makers were likewise outstanding (see Aegean vases). The sculpture produced by Cretan artists was decorative rather than monumental, but of exquisite quality. Figurines of glazed terra-cotta, ivory, and ivory and gold, especially the elaborately decorated figures of snake-goddesses, show admirable

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

craftsmanship; and the reliefs carved on steatite vases have a vivacity and naturalistic charm similar to the fresco paintings. In metal work there was also superb artistry, with lovely floral patterns bordering bronze basins, hunting scenes skillfully worked in repoussé on cups of gold, and bronze dagger blades decorated with damascened scenes of lion hunts in gold and silver. The work of these artists was widely exported throughout the eastern Mediterranean, and exercised great influence on the island and mainland cities of Greece. The brutal invasion of Crete by Dorians about 1200 B.C. marked the end of this culture. —W.R.A.

**cretonne.** Named for Norman village of Creton. May have a ribbed weave. Printed pattern not visible on reverse side owing to density of material. Drapery fabric.

**crevé.** *Etch.* A condition where the acid has widened and broken down the areas between lines, so that they print a gray and faint impression. —K.K.

**crewel.** North England dialectic word, meaning twisted wool.

**cribb.** *In construction*: (1) To line (the walls of a pit or shaft) with poles, timber, or planking. (2) A frame of poles or timber, as to retain a bank of earth. —J.M.M.

**crimson lake.** See cochineal.

**crochet rugs.** Made similar to a knitted rug using the crochet stitch and strips of cut cloth instead of yarn. —B.E.J.

**crockery.** General term for common earthenware. See CERAMICS II.

**crocket.** An ornament, usually in the form of curved foliage, found on the sloping edge of a flying buttress, gable, pinnacle, etc. of a Gothic building.

**croma.** See NOTATION.

**Cro-Magnon art.** See PREHISTORIC ART.

**cromlech.** A dolmen; a stone circle.

**chromophores.** See COLOR.

**cromorne.** See MUSICAL INSTRUMENTS.

**cross.** See HERALDRY.

**crossing.** In a church of cruciform plan (q.v.), the space at the intersection of the nave and transepts.

**cross ribs.** See Gothic.

**Cross River art.** See AFRICAN NEGRO ART.

**crotchet.** See NOTATION.

**Crow art.** See Plains Indian art.

**crown.** The keystone or highest point in an arch or vault. See also book sizes.

**cruciform plan.** The plan of a building in the form of a cross.

**crux ansata** (L.). The ankh (q.v.); the cross of life.

**crwth.** See MUSICAL INSTRUMENTS.

**crying vibrato.** See VIBRATO.

**crypt** (Gr. *kryptos,* hidden). A secret recess or vault; generally partly or entirely under a structure.

**crystal glass.** See GLASS and GLASS MAKING.

**cubism.** An important movement in modern French painting and to a lesser extent in sculpture, begun by Picasso and Braque in 1907 and gradually expanding in the 1910's to acquire the scope of a significant international movement. It is semi-abstract and comparatively geometric (whence the name), and is spoken of as analytical or synthetic and two-dimensional or three-dimensional.

The movement was founded under the influence of African negro sculpture and Cezanne, and the founders were especially influenced by a statement of Cezanne in a letter to Emile Bernard, published in 1907, in which he said, "You must see in nature the cylinder, the sphere, and the cone". This led Bragne and Picasso to reduce natural forms to their fundamental geometric shapes, which, designated as analytical cubism, represents the first phase of the movement lasting until 1913. Picasso's *Young Ladies of Avignon* of 1907 is often called the first cubist picture and his *Head* of 1909 the first cubist sculpture.

At first merely geometric facets of natural forms were stressed, and the third-dimension was retained. This was followed by the development of "simultaneity"—the simultaneous presentation of different views of an object in the same picture. At the same time color was gradually eliminated and the pictures became monochromatic and more two-dimensional in design, eliminating movement or

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

modelling in depth. The second phase of cubism, synthetic, developed in 1913 with the use of the "collage", in which pieces of paper and other materials were pasted on the surface of the canvas and became part of the painting. This led to the principle of constructing the cubist pictorial object synthetically, rather than abstracting a picture analytically from the model. The resultant compositions were increasingly two-dimensional and decorative, and in general were more colorful and less ascetic than analytical cubist paintings. This style was continued by Picasso until 1925, when he began to introduce psychic meanings and surrealist elements into his cubist work, and by Bracque in a purer and less psychic form until the 1930's.

In addition to the work of Picasso and Braque cubism includes the painting of Gleizes, Metzinger, Leger, Delaunay, Picabia, Gris, Marcoussis, Villon, la Fresnaye, Marcel Duchamp, Ozenfant and Jeanneret.

In sculpture, which is less well adapted to austere cubism than painting, there are fewer significant artists and few examples after 1925. As in painting the line of demarcation is tenuous between semi-abstract cubist forms and near- or pure-abstract forms. Sculptors who may be termed cubist, however, include Picasso (beginning 1909), Archipenko (as early as 1910), Boccioni (as early as 1911—futurist), Laurens (beginning 1912), Duchamp-Villon (from 1912), Lipchitz (from 1914), Belling (frequently), Brancusi (more often near-abstractionist). See abstraction, constructivism, FRENCH ART. See Alfred H. Barr, Jr., *Cubism and Abstract Art*, 1936. —L.D.L.

**cul-de-sac.** See CIVIC PLANNING.

**cullet.** See GLASS AND GLASS MAKING.

**culture.** A culture is a social heritage. A culture comprises inherited artifacts, instruments, technical processes, ideas, habits, evaluations, language, and the liturgical paraphernalia of religion. Thus a culture will consist of material and psychological components. These components are made to interact with more or less intelligence by those born into the social organization or culture which those components constitute. As a consequence of this interplay of the material and psychological components, a culture develops the idiosyncrasies by which it is differentiated from other cultures. —R.W.C.

**cuneiform.** Wedge-shaped; applied esp. to characters of inscriptions of ancient Babylonia, Persia, Assyria, etc.

**cupola.** A roof or ceiling of rounded form; also loosely applied to any small structure built on top of a roof or building.

**Cupid.** See Aphrodite.

**cupped mouthpiece.** See ACOUSTICS; MUSICAL INSTRUMENTS.

**cuprammonium rayon.** Filaments composed of a regenerated cellulose which has been coagulated or solidified from a solution of cellulose in ammoniacal copper oxide.

**cursive scripts.** See writing.

**curtal.** See MUSICAL INSTRUMENTS.

**curve of Praxiteles.** The Athenian sculptor Praxiteles (fl. 370-330 B.C.), famous for his sensuous representation of lovely human bodies in moments of repose, secured this effect by placing the figure in a relaxed standing position, with the weight on the forward right foot, the left foot swung lightly back, the left arm extended to the side, often resting on a tree or an ornamental vase, the right hip curved out, and the head turned to the right, so that the entire body assumed the position of an inverted S-curve. —W.R.A.

**curvilinear perspective.** See PERSPECTIVE.

**cusped arch.** An arch embellished by pointed triangular shapes formed by meeting curves and projecting from the intrados of the arch.

**cut-pile.** Having a pile or nap composed of fibers or threads standing erect, produced by cutting or shearing the surface so as to cut the loops of the thread. (Velvets, corduroys).

**cutting (or editing, montage).** Generally considered the most important creative act in the making of a film, and the unique aesthetic attribute of the motion picture medium. Physically, cutting is the instantaneous transference from one pictorial image to another; aesthetically, it is the joining of images with a view to the emotional and intellectual overtones of each, so that two or more images in conjunction convey more than the sum of the visible content of each.

Through the cut, the director of a film is enabled to break down an action into its component visual elements, and thus to show on the screen only those parts of the action which advance the narrative or develop the theme

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

(analytical montage); he is able also to destroy real time and real space and create **film time** and **film space** by showing two sets of events widely separated in time and space but shown alternately on the screen so that they appear to occur simultaneously (parallel action) or so that they build a new concept by presenting some comparison or contrast (contrastive cutting). The director may also create appropriate sensations in the spectator by cutting his film "**fast**" (a succession of short shots) or "**slow**" (a series of shots of long duration). The rate of cutting, and the "cutting tone" thereby produced, vary throughout the film according to the requirements of mood and action.

Alternatives to the cut are the **dissolve**, the **fade**, and the **wipe**. In the dissolve, a second shot appears on the screen seemingly under the first, and becomes increasingly distinct; the first shot then becomes decreasingly distinct and disappears. In a fade, an image gradually appears on, or disappears from, a dark screen. In a wipe, the screen image seemingly is peeled off, revealing another image beneath it. Dissolves, fades, and wipes are usually employed to mark the beginning or the close of a sequence. The cut may be used for the same purpose. —I.B.

**cutting plane.** See PERSPECTIVE.

**Cycladic architecture.** See Aegean architecture.

**cyclorama** (cyclos, circle, and *horama,* sight). A photographic or light projection or a painted view, extended circularly so that the spectator is surrounded by it and so gets the illusion of seeing it as if he were out-of-doors. In the theatre the cyclorama curtain is the circular curtain upon which such views are projected. See MODERN STAGESETTING. —V.K.B.

**cylinder seal.** In ancient Mesopotamia, a cylinder of stone, ivory, or clay inscribed all around with a design or inscription for sealing. See MESOPOTAMIAN ART.

**cylix.** A wide-bowled Greek drinking cup, one of the most popular shapes from Mycenaean times through the greatest period of Athenian vase-painting. Corinthian 6th cent. B.C., cylixes were heavy of body, with low stems, shallow bowls and stubby handles, and decorative patterns painted over a large part of the surface. Athenian black-figured cylixes, at first squat with thick stems, soon became more graceful, with more generous bowls, high stems, and decoration confined to a band along the outside, and on the inner rim and bottom of the bowl. The finest cylixes were the product of such masters of the red-figured style as Euphronius and Brygus, who painted animated friezes of mythology and everyday scenes around the outside, and mastered the problem of filling the circle in the center with well-composed figures. Favorite themes of the painters were dancing and drinking scenes. —W.R.A.

**cyma recta** (Gr. *kyma,* wave). A classical moulding consisting of a double curve below a fascia, made by swinging a reverse curve at the non-projecting end of a cavetto, i.e., the projecting part of the double curve is concave; when ornamented carries a lotus and palmette pattern. —L.T.S.

**cyma reversa** (Gr. *kyma,* wave). A classical moulding consisting of a double curve made by turning a reverse curve at the non-projecting end of an ovolo, i.e., with its projecting curve convex; often ornamented with the Lesbian leaf pattern. —L.T.S.

**cymbals.** See MUSICAL INSTRUMENTS.

**cypress.** See SYMBOLISM IN FAR EASTERN ART.

**czardas.** This ancient Hungarian national dance in 2/4 meter employs infinite variety of movement, figures, and tempi. It is danced by one or more couples, and is divided into two parts, the first very slow, and the second rapidly increasing in speed. In the first section, movements from side to side establish a horizontal feeling, while the jumps, leaps, and hops of the second emphasizes verticality. Great freedom is allowed in the improvisation of steps and formations. Thus the range of possible movement is great, including turning, cut-steps, deep knee-bends, twisting the hips, stepping sideward and clicking the heels, etc. —J.G.

**CZECHOSLOVAKIA, ART OF.** *Folk art* gives a most faithful record of a people's peculiarities and endowments. The peasant art of Czechoslovakia is interesting for it reflects not only the temperament of the people, but the various influences to which they have been subjected, even to the very nature of their land. The western part of the country, Bohemia, which is inhabited by the Czechs, was subjected to the culture of Western Europe, more particularly the Germanic peoples, while Slovakia in the east was long under the in-

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

fluence of the Magyars and Roumanians. The differences nowhere are sudden but show a gradual transition between the four regions; Bohemia, Moravia, Slovakia and Ruthenia. Bohemia, always the most progressive of these territories, has lost her folk art with only one execption. The Chods, living in the Sudeten area, still retain their old customs and costumes. Domazlice and Klencin are the two towns richest in the Chod culture. Moravia's art more nearly resembles the old Czech art but is better preserved with most of its villages still holding to the old traditions. The Slovaks of the eastern region are an agricultural people whose villages are too remote to be affected by outside influence. The old Czechslovakia proverb, "Over every hill you find another costume", proves true, for hardly two villages show the same style. The fourth and most easterly region, Ruthenia, is still quite primitive showing a very definite Russian influence.

There is a natural tendency toward decoration and brilliant color. It is interesting to observe the harmony of art with the environmental conditions. For example, in the richer spa villages the art takes on a more elaborate form. The amount of embroidery on the costume seems to be in proportion to the wealth of the family. The use of gold and silver thread is quite popular, as is brilliant colored silk floss. In the poor mountain districts, where the women work in the fields, there is less time for handiwork and the costumes are noticeably plainer, though no less beautiful. The majority are executed in red cotton on a heavy linen crash.

The greatest difference between the costumes of the more prosperous Czechs and the other sections of Czechoslovakia was their use of manufactured materials. Luxurious colored silk brocades were used for the skirts and aprons, with bodices of velvet. Scarves were of patterned silk or wool with long fringe. What embroidery there was, was subtle in color—the most usual was white on white—or one color, such as blue, embroidered on a white ground. This handiwork was limited to sleeve edgings and caps, and was usually combined with lace. Compared to the Czech, the work of the three other groups are more similar and offer us a better study in the needlework craft. It is not unusual to find as many as twenty different stitches in a single piece. The motifs done on heavy homespun are intricate conventionalizations of flowers, leaves, and birds with an occasional use of hearts, stars, or some geometric shape.

Particularly worthy of note is the exquisitely fine, yellow embroidery on the sleeves and caps of Piestány, the beautiful white plaited blouses of Uhersky Ostroh, and the gay aprons of Kyjov. In some of the villages, like Detva and Svatoboric, the men's costumes are very elaborate; wide embroidered sleeves of extraordinary length, extremely short vests, and long streamers of flowered ribbons hang from neck to knees. These are the main characteristics of the strangely proportioned masculine attire of Svatoboric.

The dwellings of Bohemian villages are of stone or painted stucco. The roof line shows a very definite influence of the Baroque style; in fact this derivation is sometimes termed **village baroque.** Slovakian mountain villages are of whitewashed log houses with dark brown gables interestingly carved and all out of proportion in size to the house. Lumber is plentiful in the mountains, hence the log house instead of stucco. In the environs of Bratislava is the village of Modra (blue), so named because the houses are all painted blue. Aside from the color of the houses, Modra represents a good example of the towns in this region. Unlike the jig-saw arrangement of the villages elsewhere in the republic, Modra and its neighboring towns have an orderly pattern. The houses are lined along the straight streets. Each married son builds his home as an addition to the back of his father's house. The result is a long narrow building at right angles to the street. The interiors are particularly gay, with every conceivable wall space covered with free-hand paintings of bright colored flowers and decorative ceramic plates. From the beamed ceilings hang ceramic jugs, and lining the walls is a long, continuous bench gaily decorated too. In one corner of the parlor usually stands a bed piled high to the ceiling with pillows and featherbeds, all covered with richly embroidered cases. The painting of these interiors is done by the women who get help in the lay-out and design from the village **pisarka** (the woman whose profession it is to plan the designs for her village).

Nowhere are the houses so interesting or beautiful as those in Cicmany, one of the most remote villages in Slovakia. Here can be found some of the greatest treasures of antiquity. The thatched-roof houses are made of logs fitted together with clay. The clay is painted with geometric designs as are the corners of the house and areas surrounding the windows. The unusual feature of the interior is the open fireplace where the cooking

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

is done, the smoke from which spreads through the room leaving the walls and ceiling sooty, and shining like pitch.

Other architectural interests are the strange wooden churches of Ruthenia with their obvious influence of the Byzantine, shown particularly in the onion-shaped domes. Throughout the entire country the little shrines, situated in the midst of fields, at the roadside, or crossroads, show an interesting development in peasant architecture, as do the carved and painted crosses in the country cemeteries.

Ceramics are an important peasant art. The Czech ceramics were influenced by the Italian Renaissance. The technique of the majolica ware was brought to Bohemia by Italian craftsmen who were invited by the nobles to teach the Czechs this craft. Ceramics in Moravia and Slovakia, on the whole, were not affected by outside influence. Some of the loveliest pieces are the **Haban ceramics.** The Habans were a group of Anabaptists who settled in Slovakia around 1546. The popular **Modra ware** is made in the village of Modra; it is well known, for these old designs are today manufactured on a large scale. In the Chod district of Bohemia the heavy sombre-colored pottery is still made in the most primitive of methods.

*Architecture.* Czechoslovakia, particularly Bohemia, with its capital, Prague, possesses many interesting buildings which display the whole evolution of European architecture, modified by the Czechoslovakian influence.

The churches are the prevalent architecture of the early styles. Toward the end of the 9th cent., the Macedonian apostles who Christianized the nation, brought with them the influence of the Byzantine. The rotunda buildings, which were developed in this period, were confined to the vicinity of Bohemia and Moravia—not extending farther westward. For the most part, these structures have burned or have been rebuilt.

The simple rotund building developed in the Romanesque period to a larger structure with a semi-circular apse, a nave and two aisles. St. George's Church, 1142, in the Prague Castle, is one of the best examples of this basilica type.

Around the end of the 12th cent., the Gothic culture, originating in France, brought impulses to Moravia, and the Cathedral of Trebíc, 1233, is a unique example of a traditional style. Later the Gothic style extended into Bohemia, quickly replacing the Romanesque without any transitional period. Gothic art flourished particularly under the reign of Karel IV, who had been educated in France and was greatly impressed by the elevating quality of the Gothic cathedrals. Karel laid the plans for the St. Vitus Cathedral situated high on the Hradcany, the most impressive of Prague's churches, whose spires tower high over this "Hundred Spired" City. Mathias of Arras, a Frenchman, began work on the Cathedral in 1344, and was then succeeded by the Czech, Petr Parlér, under whose guidance Czech architecture attained a world standard.

The towers of the Charles Bridge (Karluv Most), the Old Town Hall Chapel (Staromestska Radnice), the Tyn Church, the Powder Tower (Prasná Brána), and the well-known Karlstein Castle (Karluw Tyn), are all examples of the so-called **Vladislav Gothic style** which prevailed in Bohemia between 1475 and 1508, a Gothic style peculiar to this country, square towered and less elaborate than the French Gothic.

The 16th cent. marks the advent of the Renaissance into Bohemia, though the early Renaissance, like the late Gothic style, had a character all its own, which gives evidence of the independent spirit that so typifies Czechoslovakian art. Later there was a marked influence of the Italian Renaissance brought into the country by noted Italian architects who were working in the court of Ferdinand the First. The Spanish Hall in the Hradcany, Belvedere and Schwarzenberg Palaces, are examples of this style in Prague.

Throughout the baroque period there was an intense activity of building. Many features of Italian baroque classicism were imported by Italian architects from northern Italy, so many that Rodin, the famous French sculptor, called Prague the "Rome of the North".

Around the middle of the 17th cent., the Jesuits began their influence throughout the country, trying to recatholicize the population. They built elaborate churches and convents, which today are the best of the baroque architecture in Bohemia.

K. I. Dientzenhofer, the greatest architect since Parlér, was a master at baroque exaggeration. He overcame outside influence and brought the level of Czech architecture to the European standard. The most outstanding structures of this period are St. Nicholas Church (Svaty Mikuláse) and Waldstein Palace. From an architectural point of view, Prague ranks among the foremost cities in Europe.

The 20th cent. is represented in this country by factories, administration buildings, chateaux,

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

and sanitariums, done in the extreme modern style. In the spa villages throughout the republic, the contrast between the modern sanitariums and the primitive homes of the peasants offer an interesting comparison.

*Sculpture,* around the earliest centuries, (11th and 12th), was not a separate art but was always found in conjunction with architecture. The earliest examples are carved in wood and it was not until the monks of the Sazava Monastery fostered this art (about the 11th cent.) that there is any record of modeled sculpture.

The Romanesque period is represented by the reliefs and decorations on the churches of this period. St. George's Church in Prague, the 12th cent. plastics in the church in Spis, Slovakia, and the portals of the Trebic Cathedral in Moravia (which is one of the most important Romanesque structures north of the Alps), are typical examples of Czechoslovakian Romanesque.

An exceptional development in sculpture was shown during the Gothic period, reflecting a great deal of the culture of Western Europe. At first the portals, capitals, and tympanums were mostly decorated with plant motifs; the use of figure compositions was rare until later. Czech Gothic sculpture reached its apogee under Petr Parlér, the architect, who was also a master in stone. Some of Parlér's works are the statue of St. Vaclav and the tombstones of the Czech kings, both in St. Vitus Cathedral; also the triforium of the church, which has a row of marble busts, portraits of the kings, queens and others who patronized or assisted in the construction of the cathedral.

Local sculptors in Moravia attained a high level and left magnificent examples of their work in the cities of Brno and Olomonc. The real period of creative work began in Slovakia around the 15th cent. with the late Gothic. The cathedrals in Kosice and Presov are rich in this style.

Czech Renaissance sculpture is characterized by its fine decorative craftsmanship. Some beautiful work is found in stucco ceilings, carved wood furniture, and decorative metal work. Unfortunately, a great deal from this period was destroyed or carried away during the Thirty Years' War. One of the few remaining pieces of plastic Renaissance sculpture is the "Singing Fountain" in the garden of the Prague Castle.

The baroque sculpture in Czechoslovakia at first developed under the influence of Renaissance craftsmen, but by the middle of the 17th cent., the pure baroque impulse was brought to this country from Bavaria, Austria, and Italy. The Charles Bridge (Karluv Most) is a regular museum of baroque sculpture. It is the only bridge of its kind in the whole of Europe and it consists of sixteen arches, the pillars of which are decorated with statues of the Saints. A statue of St. John Nepomucene (Sv. Jan Nepomuck) stands on the spot where it is alleged he was thrown off the bridge into the Vltava, in 1383. The bridge sculpture is the work of two important Bohemian sculptors, Mathias Braun and Ferdinand Maximillian Brokov. In the St. Vitus Cathedral is the tomb of St. John Nepomucene, an impressive piece done completely in silver and ornately decorated with figures. It is the work of J. E. Fischler, made around 1736.

Among the 19th cent. sculptors, Josef Vaclav Myslbeck rises considerably above the local standard. His monument of St. Vaclav stands at the upper end of the main square in Prague (Vaclavské Námesti), an inspiring sight of high artistic merit. The monument of Jan Hus, which stands in the Old Town Square, is also an excellent piece of work, done by Ladislav Saloun.

*Painting.* Unfortunately, little remains of early Czech painting. The few examples preserved are restricted mostly to paintings of religious scenes done on cloth or wood.

In the Romanesque period, fresco painting in the churches developed sooner than sculpture, dating from the second half of the 12th cent. St. George's Church in Prague, St. Catherine's (Sv. Kateriny) in Znojmo, Moravia, and the Cathedral of Sivetice in Slovakia, show outstanding Romanesque murals. The miniature paintings in the illuminated books surpass all other similar works of Central Europe at this period.

Karlstein Castle possesses a wealth of Gothic murals, most of which are done by unknown artists; the only known name being Theodoricus who executed a strong influence over the art of his time.

Toward the end of the 14th cent. the artist called "Master od Trebon" was the outstanding painter of Central Europe, and the equal to any in the west of Europe. He developed the light and shade technique hitherto unknown in this section of the country.

The Hussite Wars wrought great destruction to art in the 15th cent., after which Prague and Kutna Horá emerged as the two centers for late Gothic realism. The high altar of the Cathedral in Kosice, Slovakia, is

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

made of painted panels, the richest of this type created in the whole republic.

Sgrafitto painting was introduced by the Italians during the Renaissance period, and not only the interiors but also the exteriors of public buildings were decorated in this manner, such as the Minuta House in Prague, and Schwarzenberg Palace.

The great building activity, following the lull of artistic endeavor caused by the Thirty Years' War, brought considerable development in decorative mural paintings. The work of Karel Skréa, Petr Brandl, and Václav Reiner can be found in the Prague National Gallery, representing the Baroque period. The subject matter of these paintings were partly religious and partly historical or allegorical battle scenes.

Painting emancipates itself from foreign influence in the 19th cent. The pioneer in this was Josef Mánes (1821-71) who made a study of native types and created an interest in the folk-lore of his people. Mikulás Ales (1852-1913), with his excellent illustrations of folks songs, was very popular, and through his sketches educated the people in the customs and costumes of the peasants. Joza Uprka, from Moravia, also found expression in the brilliance and beauty of the Slovak costumes.

The modern movement has quite a foothold in Czechoslovakia and while it is too new to make any judgment as to its quality, there is a great national interest and acceptance of it. Some of the artists who have led in this movement are Emil Filla, O. Kubista, Oskar Kokaschka, Vlastimil Rada, Frantisek Tichy, and Jan Zrzavy. See *Primitive and Peasant Art,* ed. Felix Payant; *Peasant Art in Austria and Hungary,* ed. Charles Holme; "The Arts of Czechoslovakia", *Art and Archaeology,* vol. XI, 5. —V.N.

# D

**dabber.** A pad used by engravers, etchers, etc., to apply ink, color, etc., evenly.

**da capo aria.** See opera.

**Dacca muslin.** See cotton.

**Dadaism** (F. hobby horse, cock-horse). A movement in painting, sculpture, and literature which began officially in Zurich in 1916, when the word *Dada* was discovered by chance in a dictionary and seemed to epitomize the aims of a group of artists and authors from various countries who were working in Zurich at the time. Their philosophy involved a complete nihilism, satirical disillusionment and violent protest, disgust with and ridicule of civilization, iconoclastic destruction and programmatic disorder, systematic demoralization, and a glorification of the irrational or anti-rational, and anti-aesthetic, and the amoral. In part at least, the movement may be said to be a product of World War I disillusionment, which aroused in the Dadaists a vicious disgust with all aspects of the civilization which produced such a senseless holocaust. Disguised by a thin veil of humor, Dadaism was in reality a cynical and diabolical rebellion against all social conventions and their accompanying inhibitions, and represented the cultural counterpart of political anarchy. Its chief accomplishment was not so much the merit of work produced, as in preparing the way for the more mature form of fantastic art which succeeded it under the name of surrealism.

The method of the exponents of the movement was to produce earnest and serious, essentially tragic nonsense with uncensored spontaneity, allowing forms to arise uninhibited from the subconscious, aided by automatic, semi-automatic, or hypnotic techniques of drawing or writing. Their products were fantastic, frequently symbolic, irreverent, ironic, amorphic or mechano-morphic concoctions, often typed in one or another weird category, e.g. **rubbish constructions, fatagagas,** *"merz"* pictures, **ready-made objects, exquisite corpses, collages, rayographs** (qq.v.). Examples of titles of specific pictures are *Catch as Catch Can; Amorous Procession; Infant Carburetor; Wet Paint; Object of Destruction; Self-constructed Little Machine; Here Everything is Floating; The Little Tear Gland that Says Tic Tac; The Gramineous Bicycle Garnished with Bells; the Pilfered Greybeards and the Echinoderms Bending the Spine to Look for Caresses.*

Dadaism was anticipated between 1910 and 1916 by proto-Dada works of de Chirico, Kandinsky, Duchamp, Picasso, Braque, Boccioni, Picabia, Archipenko and Klee of whom only Picabia was ever an official Dadaist. It lasted in Germany until 1920 and in France until 1922. The chief exponents of the movement, of whom many were both artists and writers, include Tristan Tzara, Hans Arp, Marcel Janco, Huelsenbeck, Hugo Ball, Francis Picabia, Man Ray, André Breton, Philippe Soupault, Guillaume Apollinaire, Louis Aragon, Max Ernst, Christian Schad, Kurt Schwitters, J. T. Baargeld. Members of the group held numerous exhibitions, published proclamations and manifestoes from time to time, published several short-lived periodicals of poetry and criticism, e.g. *Cabaret Voltaire, Sic, "391", Dada, Club Dada, Cannibale, Die Schammade,* staged dances, plays, public readings of poetry, *soirées,* festivals, opened a Dada nightclub in Berlin, and founded a newspaper in Cologne.

Dadaism differed from **surrealism** (q.v.), of which it was a direct antecedent, in emphasizing irrational and uncontrolled techniques of art production. It was the rebellious,

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

anti-rational art of the unconscious, whereas surrealism is non-rebellious, super-rational, and a conscious, often deliberately Freudian presentation of dream or dream-like images, which fuse the real and the unreal into a super-reality. Many of the original Dadaists became surrealists after 1924. See FRENCH ART; also Alfred H. Barr, Jr., *Fantastic Art Dada Surrealism,* 1936. —L.D.L.

**dado.** A plain flat, horizontal, and often decorated surface or band at the base of a wall.

**Daedalic style.** See HELLENIC ART.

**dagaba** (Singhalese). See dagoba.

**dagoba** (Singhalese). A monumental reliquary. See stupa; INDIAN ART.

**dai** (Jap.). A pedestal or stand. See also daiza.

**dai-bon** (Jap.). See key-block.

**dai-sho** (Jap.). Term used for companion swords worn by the samurai, or military class of feudal times. **Dai** (long sword, *kaiana,* q.v.); **sho** (short sword, *wakizashi,* q.v.).

**daiza** (Jap). The pedestal upon which a sculptured figure rests.

**damascene technique.** The application of metallic designs to iron or steel as seen on Damascus blades.

**Damascus ware.** See ISLAMIC ART.

**damask.** Named for the city of Damascus. Brought to Europe by Crusaders. Silk was material of the 12th cent. damasks which were woven on hand looms. Linen and cotton damasks are woven on Jacquard looms (q.v.) today. Wool, silk, cotton and rayon in combination are used in modern damasks. Damask fabrics in general are characterized either by warp or satin figuring upon a weft ground or vice versa. A twill weave may be employed for the figure and a satin weave for the ground. This fabric is reversible and sometimes equally interesting on both sides. Table linen is usually damask pattern. —G.W.R.

**dammar.** A favorite among the resins used for varnish making, this is a product of a family of trees that grow in the Malay states and in the East Indies. It is pale in color, has a good lustre, and adheres well. It has the peculiar characteristic of being entirely soluble in hydrocarbons such as toluene and benzene and in petroleum spirits. It dissolves, also, in alcohols and in turpentine. See RESTORATION OF PAINTINGS. —G.L.S.

**Dan art.** See AFRICAN NEGRO ART.

**DANCE.** Every age has had its dance, and the fact that dance has not perished is evidence of its value to mankind. The fact that there has always been dance compels it to be accepted as an old and deeply rooted human activity whose foundations reside in the nature of man himself. The universal interest in dance rests upon the fact that it carries on and systematizes an activity that is operative in everyone's experience: it is co-existent with life.

Like the history of all the arts, the history of dance has followed those changes in attitude and feeling, and those fluctuations in man's concept of art which have given to every period its distinctive qualities.

As man lives longer and gains more experience and a better understanding of his world, his ability to adjust himself and survive depends more and more upon his mental powers rather than upon physical prowess alone. Along with the evolving intellectual life our aesthetic and emotional natures have developed, and with this complex scheme of development our sense of values and our tastes have grown. Therefore dance, as an art form, is a medium that has always reflected man's mental evolution. His artistic evaluations are reaching higher and higher, and in the process his aesthetic needs are preferring abstraction as suggestion, rather than realism as detailed description and copy. But the same life forces will actuate the dances of today as in the past. Man feels as deeply now as then. Feeling is constant. Only form is variable. What has happened is that racial and folk tendencies have gradually developed into more spiritual ideals, which have become the motives for expression. Experience tends to universalize the individual to the extent that concrete emotions and concrete dramatic situations take on more abstract form in the art expression of them.

Thus during the march of the ages man's expressive movements have become modified by his growing realization of the effect of his own actions, until at last these actions have been consciously and intentionally used as expressive tools. It was when thus modified that expressive movement became art dance — a form consciously pursued for its art values.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

The desire and need for communication as well as for expression have led man to the discovery of aesthetic means. From this search for a means have evolved the knowledge, science, and technique of dance. At the same time this search has led to a refining of the basic impulses, causing various civilizations to elaborate and standardize forms of emotional expression.

The technique of dance is profiting from increased knowledge of motion and rhythm as applied to the movements of man. Physiological and psychological research have revealed to us the nature of the kinesthetic sense, the kinesthetic basis of rhythmic perception, and the relation existing between feeling and its motor expression—revelations which have made possible a new technical training. Also, the present scientific attitude has encouraged a habit of mind that is reflected with great benefit in our dance forms. It has made for clarity, simplicity, and directness. Its honesty of thinking leads to genuineness of feeling, which leaves little place for superficiality. Although the less forceful rhythms of 19th cent. romanticism have been replaced by the more vigorous, pulsating, and varied rhythms of our less leisurely age, that does not mean that the romantic spirit and sentiment are lost to us of today. Their mode of expression has merely changed to the modern idiom—meaning the discarding of unnecessary embellishments in the effort to attain a direct and frank simplicity of movement. Only such a dance form could be the correlate of the wide-ranging, complex, intellectual, and cosmopolitan character of our age. Its direction as a fine art is toward universal symbolism, much broader in its scope and meaning than any racial art or the art of any one age.

Today we are not concerned with traditional values as answers to problems that no longer exist. We make use of the same primitive elements with which our ancestors began, but with a difference: once a reflex outlet for strong emotional pressure, dance has become deliberate creation in which the intellect and will dominate the automatic and emotional impulses. There is a gain in consciousness, but no change in the essential working of biological and aesthetic processes. There is merely a refining of their functioning. We no longer expect dance to be the expression only of the more lofty and poetic feelings, but accept it as the expression of all that the heart can feel—its pangs, ecstasies, passions, moods, and aspirations. Its manner may include the satiric, the lofty, the simple, and the extravagantly strange. Dance will continue to grow despite confusion concerning its meaning and the various forms of its utterance.

The pleasure of obeying the impulse to move and to express in ordered movement our responses to the forces of our nature and of our environment remains the same in every time and place. The differences between the dances of the past and those of the present are but differences in outer form: in period, location, temperament, education, and taste, which together determine the cultural values of any age. Basically concerned with the primary issues of life, dance has been inseparably connected with the expression of the cultural development of every period, and in turn has exerted its influence on the social patterns of the past. —M.N.H'D.

**dance, a.** As an art form, a dance, or a dance composition is a designed entity. It is an embodiment of emotional experience in expressive movements, upon which the principles of composition are consciously imposed by the personality which was the subject of the experience. It is an artistic image motorly conceived.

*Subjectively,* a dance is an ideal toward which the imaginative mind reaches and in which satisfaction is experienced in the attainment of the ideal; *objectively* a dance is a reality so formed that it becomes a movement symbol expressing and communicating this ideal.

A definition sufficiently broad to include the less highly developed forms, such as tap, folk, group and ballroom dancing, might be stated as follows: A dance is the rhythmic motor expression of feeling states aesthetically valued, whose movement symbols are consciously designed for the pleasure of re-experiencing, expressing, communicating, executing, and of creating form. —M.N.H'D.

**dance as art.** The idealistic expression of man's emotional nature transformed by thought and consciously given movement form. Its significance does not change—only its forms have changed revealing changes in man himself, in his times, and in his beliefs, desires and growing sense of artistic values. —M.N.H'D.

**dance drama.** A dance that has for its content some definite situation or story. The theme may be simple enough for a dance of a single interest, or sufficiently complex to take on

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

the proportions of a dramatic plot. In either case, the dance movements depend upon a text containing some realistic human interest that kindles the imagination and arouses the emotions. And since the emotions are to be reached through ideas, the movement will be somewhat restricted by the necessity of following rather definite reaction patterns. Such dances are descriptive or narrative in character. (H'Doubler, M. N., *Dance, A Creative Art Experience,* F. S. Crofts & Co., 1940.)

**dance music.** The simplest accompaniment to the dance was produced by the movements of the dancers themselves, by the stamping of feet and the clapping of hands. These sounds were stressed and amplified by instruments of percussion In contrast to much vocal music which was based on the rhythms of speech, dance music was organized by the natural and periodic body movements of man. Its motor character was intensified by the noises which accompanied it. A pronounced motor impulse would seem to be almost lacking in certain Eastern dances which depend entirely on expressive and significant gestures for their effect.

When song accompanied the dance, it ceased to be recitation. The words frequently declined in significance, and nonsense syllables became more frequent as the rhythmic element assumed greater importance. As the beat of moving feet dictated the metric structure of dance music, so the figures of the more highly organized dances outlined the form of dance melodies. As steps forward are balanced by steps to the rear, so phrases in the melody must correspond in symmetry.

Once the musician had constructed his dance tune, the desire for variety led him to alter the too frequent repetitions of the melody by improvisation. Such practices ultimately passed into musical composition in the form of divisions over a bass such as *La Folia,* in the passacaglia, in sets of variations on folk-dance themes. Sequences of different dances which pleased both the dancers and the musicians permitted the latter to follow a stately pavane by a lively galliard, a *Tanz* by its *Nachtanz,* often by merely altering the metric basis of the melody. This development led to the classic suite with its varied sequence of dances, allemande, courante, sarabande and gigue (qq.v.).

There was always a natural tendency for the musician to treat dance music from a musical rather than a dance point of view. Thus we find Elizabethan variations on simple dance airs which rise to such a degree of complexity as to completely rob the tune of its energetic rhythmic character. Dancers ceased to move to the music of the pavane, the allemande, the minuet. Musicians have clung to these forms long after they have been forgotten by the dancers. Thus music has been enriched by many compositions which were not intended for dancing though they preserve dance characteristics to a greater or lesser degree. Even where music's connection with the dance is not shown by the title, characteristic melodic traits, or rhythmic pattern, it is still the dance which first employed those basic and powerful pulsations which animate and underlie all modern instrumental music. It was this great fructifying influence of the dance that Wagner had in mind when he spoke of Beethoven's Seventh Symphony as the "apotheosis of the dance." —C.W.H.

**dance of death.** A cultural folk drama in the allegorical pageants of the Middle Ages—developed from the death complex so prevalent at this time. Medieval man lived in constant dread and contemplation of death in the midst of daily exposure to the ravages of war, famine, and plague. There was no conception of the consolation of death. They only knew its horrors and expressed their feelings in the concrete embodiment of death in its most gruesome aspects. Death was personified as a skeleton to convey terrifying ideas about death's punishment for sin. The *dance of death* motive was a very popular theme of the writing and art of this period. Its basic theme—the leveling process that makes all men equal—has continued through the Renaissance to our times, each age expressing it according to its own philosophy. (H'Doubler, M. N., *Dance, A Creative Art Experience,* F. S. Crofts & Co., 1940.)

**Danish art.** See SCANDINAVIAN ART.

**Danish porcelain.** See CERAMICS II.

**Dante chair.** See FURNITURE.

**Danube school.** See AUSTRIAN ART.

**dark raw umber.** See iron pigments.

**Daseian notation.** See MEDIEVAL MUSIC.

**daub.** *n.* A sticky application, as of mud or plaster. *v.* To smear or coat with something sticky; to plaster. (**Wattle-and-daub construction:** A wattle, or frame of poles and twigs platted together and covered or daubed, as with mud or plaster). —J.M.M.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

**dead-end street.** See CIVIC PLANNING.

**decalcomania.** *Cer.* Process of transferring decorations to ware See Ceramics I.

**decandenza.** See FURNITURE.

**decentralization; decentralizing, etc.** See CIVIC PLANNING.

**de cuenca.** See CERAMICS I.

**de cuerda seca.** See CERAMICS I.

**deckle.** *Book.* The unfinished edge of paper. In handmade paper this was the natural result of the frame in which the paper was made.

**declamation.** The correct enunciation of the words in recitative and dramatic music.

**decoration, decorative.** (L. *decus,* ornament). A mode of **composition** (q.v.) in art, in which details are arranged in such a way as to please, or with the intention of pleasing, the beholder through direct perceptual experience; especially through the nature and arrangement of sensory qualities such as lines, colors, rhythms, etc. The term is applied chiefly in the visual arts, but is sometimes extended to music and literature. It is sometimes identified with "aesthetic quality", in a narrow sense, as contrasted with representation, utility, meaning, content, etc. Decoration can be very simple, as in a plain color-area or the tone of a bell, or can be developed thematically (see theme) into complex pattern and design. It can be merged with other factors in aesthetic form, such as utility and representation, or can be applied separately as superficial ornament. —T.M.

**decorative art.** All phases of art utilized as a means of ornamentation, enrichment, or decoration; sometimes called **applied art**; (for example, a fire screen may be decorated with ornament for artistic effects rather than as a structural necessity; a mural painting for the enrichment of a wall space in a building is a product of the decorative arts; many results of the handcrafts and industrial arts may be classed as decorative art products.) Whitford and Winslow in *Dictionary of Education.*

**decrescendo.** See crescendo.

**Deësis.** See RELIGIOUS PAINTING IN RUSSIA.

**deflector.** (1) A device to cause deflection. (2) In southwestern archaeology: The term applied to the raised stone, mass of poles and mud, or mass of masonry, located between the fire pit and the "ventilator". Known also by the terms "altar" and "fire screen". (Some archeologists believe the "ventilator" served to conduct air into the chamber and that the "screen" or "deflector" was constructed or placed to prevent the incoming current of air from blowing directly onto the fire. Others are of the belief that the so-called "ventilator" was thought to be the entrance and exit of the spirit beings and that the so-called "deflector" was an "altar").—J.M.M.

**"degenerate" art** (Ger. *Entartete Kunst*). A term used by the Hitler party to condemn modern art. According to Hitler and his followers, modern art is the expression of "political and cultural anarchy" and "art-bolshevism" and hence must be ruthlessly suppressed. In July 1937 an exhibit of modern art (for adults only) was opened in Munich (later travelling all over Germany) under the name of *Entartete Kunst.* This exhibit was supposed to reveal the decadence of modernism and thus to serve as a warning example. The works of the following artists, among others, were contained in the exhibition: Otto Dix, Emil Nolde, Franz Marc, Paul Klee, Marc Chagall, Oskar Kokoschka, Karl Hofer, Vasily Kandinsky, Max Beckmann, George Grosz, Lyonel Feininger, Lovis Corinth and Paula Modersohn-Becker.

In the same spirit of destruction, German museums and galleries were "purified" i.e. all modern paintings were removed and many of them sold outside of Germany e.g. works of van Gogh, Gauguin, Picasso, Derain, Barlach, Modigliani, Lehmbruck as well as works of the artists mentioned above. See GERMAN ART. —H.H.

**de gustibus non est disputandum.** See TASTE.

**Delft ware.** See CERAMICS II.

**deliberate forgeries in painting.** See FORGERIES IN PAINTING.

**Delphi.** Shrine of Apollo in central Greece, famous throughout the ancient world for its oracle, the Pythian games, and the buildings and sculpture dedicated to the god. It was excavated by French archeologists in the last decade of the 19th cent. Among the most important buildings were the Temple of

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

Apollo, the Siphnian Treasury ( the first building to be decorated with two types of relief sculpture, one in low lateral relief, the other in three-dimensional mass), the Athenian Treasury, the Lesche of the Cnidians, with its famous murals of Hades and the Sack of Troy by Polygnotus, a graceful circular temple, the theatre and the stadium. Among the independent sculpture found are an archaic sphinx and kouroi, a 5th cent. bronze Charioteer, a figure of the athlete Agias (possibly a copy of an original by Lysippus), and three dancing maidens in the Praxitelean tradition, placed back to back on a high acanthus column. See T. Homolle et al, *Les Fouilles de Delphes.* —W.R.A.

**Demeter** (L. Ceres). Greek goddess of the earth and harvest, symbolized by ears of grain, a basket of plenty, a pig, poppies. In mythology she is chiefly known for her sorrowing quest after her daughter, **Persephone (Proserpina)** was abducted by Pluto; the story personifies the death of vegetation. The most famous statue of her in ancient times was the 4th cent B.C., Demeter of Cnidus, a seated figure of the classical "mater dolorosa". In later sculpture she was pictured by Permoser, Dannecker, Jannewein, Fry and Storrs. In Bernini's *Rape of Persephone* the daughter of Demeter struggles with a very determined Pluto. —W.R.A.

**demi relief.** See relief sculpture.

**demi-semi-quaver.** See NOTATION.

**dendrochronology.** A method of dating ruins in the Southwest, originated by Dr. A. E. Douglass. It is based on the theory that trees each year add a ring of growth whose thickness is dependent upon the rainfall. Thus the trees of the same species and same locality will form a definite pattern. By matching and overlapping the ring patterns of the outer side of the older and the inner side of the younger trees, Dr. Douglass gradually worked backward in time and charted these patterns into a master ring calendar for certain areas of the Southwest, extending as far back as 11 A.D. By means of this calendar any beam of the same species and locality can be dated. See A. E. Douglass, *Dating Pueblo Bonito and Other Ruins in the Southwest,* National Geographic Soc., Pueblo Bonito Series 1 (1935); "The Secret of the Southwest Solved by Talkative Tree rings", *National Georgraphic Magazine* (Dec., 1929).—H.G.

**dengaku** (Jap.). A classic dance, now rare.

**denim** (F. *serges de Nimes*). A heavy coarse cotton twill weave. The warp is blue or brown with a white weft; washable.

**dentils.** A series of small, rectangular blocks projecting like teeth, as under Ionic and Corinthian cornices.

**Der Blaue Reiter.** See expression.

**descort.** See MEDIEVAL MUSIC.

**design.** (It. *designare,* which Hoare's *Italian Dictionary* derives from L. *de, signum,* to show by marks). (1) Fundamentally, the word seems to imply some application of drawing to the production of art, but it has spread over a wide range of derivative meanings. It can be applied not only to sketches but to far more complete works, which may have been produced by techniques as distantly related to drawing as painting and carving in wood. It may even be transferred, by analogy, to still more remote arts, as in speaking of the design of a symphony or of Dante's *Divine Comedy;* but there is probably a tendency to restrict it to work with a framework so simple and so definite that it could almost be outlined with a pencil. In modern usage the word refers oftener to some such framework than to a completed work—occasionally, as in the cases just cited, to the framework which an experienced observer can detect in the finished product but usually to the one that the artist himself uses as a sort of scaffolding to aid his work. It may exist only in his mind but, in the arts of space at least, he is more likely to make some record of it and it is this record that the word most commonly denotes. Ideally, it will be a graphic, shorthand solution of the intricate problem in relationships which the contemplated work presents—relationships between those aspects of his medium that he can modify and those that he cannot, such as its heaviness and solidity; relationships with the tools and processes by which this medium must be worked, and to the various uses to which the finished object will be put; relationships to the memories and character and desires of the special public for which it is intended; and finally the relationships between the flexible elements of the design itself—line, shape, color, mass, and light—which will give the work its distinctive aesthetic quality. A good design may be defined as one that allots to each of these relationships a weight proper to the task in hand and combines them all agreeably and as efficiently as possible. If the problems to

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

be solved are more practical than aesthetic, as in designing a house, the solution is often called a **plan**; when the relationships involved are mainly internal, a **pattern**; and when, as in representative painting, the basic problem is the distribution over the canvas of the objects to be depicted we usually refer to the process of designing as **composition.** Certain arts, of course, have their individual traditions in the matter of terminology, which cannot be attributed to any universal customs. A three-dimensional sketch in clay for a piece of sculpture is called a **model**; a design for a tapestry is a **cartoon**; and we speak of the **choreography** of a dance. In the vocabulary of dancing **design** usually refers to costumes and stage-sets. Pepper has tried to differentiate design from **pattern** by defining the former as that aspect of a work which has been dictated by the laws of *interest* and the latter as the aspect which has been dictated by the laws of *attention,* but as yet this distinction has not been widely adopted. The earliest stage in the evolution of a design is sometimes called **laying in** or **blocking in.** For Ralph M. Pearson the design in such arts as painting is never finished until the work itself is; he uses the word as if it were essentially a synonym for form. There can be no question, however, that in most of the handicrafts design has to be sharply contrasted with **treatment,** or **execution.** And in modern machine production this contrast is intensified, because so many details that could formerly be left to the discretion of the workman must now be carefully prescribed in advance. It should be noted, too, that the mass-production that has come in with the machine has raised to a new importance the economic factors that influence design, such as cost of production, possible selling price, and the necessity of competing with a great number and variety of other machine-made products.

The tangible form which a design assumes varies considerably from one art to another, and so does its relation to the finished work. A design for a decoration to be applied to a piece of pottery may be sketched on paper but it will have to be translated by the artist into a form that will fit a curved surface. A design for a building will be a set of highly abstract cross-sections, sprinkled with numbers and arbitrary symbols, and supplemented with various elevations, perspective views, and written specifications, all of which will have to be interpreted with great skill and knowledge by a succession of contractors, subcontractors, and workmen. A design to be woven into a bolt of cloth may begin with a single colored sketch on paper, but it will have to be expanded by a draftsman into a technically complete repeat pattern and then translated—under the influence of the machine—into a set of perforated cards whose resemblance to the finished product will be very remote. A design for a painting, on the other hand, may be sketched very quickly on the canvas with charcoal, and modified endlessly as the picture evolves. When the artist is to be craftsman as well as designer he can limit his design to the scantiest network of lines and colors in which he can fix the special combination of relationships which he deems indispensable to his solution of the problem in hand.

As the proper management of the internal relationships in a design is an exceedingly complex and difficult business a number of formulas have been worked out to help the artist plan his efforts and check his results. They are commonly referred to as the **principles of design,** and they might be described as those subordinate types of organization which stand out most clearly within the organization of the whole work. It is rare to find any two lists of these principles that agree, but harmony, rhythm, repetition, symmetry, balance, proportion, dominance, subordination and variety may be cited as typical of the group. Like the major elements of verse structure—length of lines, number of lines, accents, and rhyme patterns—they may be combined in a great variety of ways, but it should be noted that they are far more likely to merge and to lose their individuality than are their counterparts in the field of verse. It is safer to think of them as rules-of-thumb for achieving some other end than as ultimate values in themselves. The term **elements of design** is more likely to be applied in the spatial arts to such tangible units or ingredients as walls, doors, windows, and roof in architecture, or color, light, and line in painting. The **motif** of a design is, roughly, the equivalent of a theme in music. It may be borrowed from nature—from the shape of an insect or the color pattern of a flower—or it may be a simple combination of lines and colors invented for the purpose, or merely some rhythmic pattern of spots and spaces. It might be described as a design for a design. See also decoration, dynamic symmetry, and the individual arts. Detailed analyses of various problems in design may be found in Harriet and Vetta Goldstein, *Art in Everyday*

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

Life; Lewis F. Day, *Pattern Design;* Walter D. Teague, *Design This Day.* —C.T.

(2) *Mus.* Artistic intention embodied in a composition; structural plan of a composition; characteristic outline, or contour, of a composition or of a particular aspect thereof (e.g., melodic design, motive design, contrapuntal design, etc.). —E.K.

**design experience.** (art ed.) (1) Practice in planning structural forms, such as in the relationships of space and mass in painting or architecture; (2) practice in creating unified expression in any medium of art; (3) practice in creating surface decoration; (4) the second stage in the development of a unit of teaching in art, the preceding stage being orientation. See design. Whitford and Winslow in *Dictionary of Education.*

**desornamentado style.** See FURNITURE.

**de Stijl** (Dutch, the style). A geometric-abstract movement in the visual arts and architecture, characterized by rectangles and primary colors, founded in Holland in 1917 by Theo Van Doesburg, and lasting until about 1931. The leading painters were Piet Mondrain and Doesburg, leading sculptor Vantongerloo, and leading architects J. J. P. Oud and Rietveld. The movement had a strong influence on industrial and commercial arts. —L.D.L.

**deus ex machina** (L. *deus ex machina,* god from the machine). In Greek tragedy, the device of introducing a deity at the end of a play to resolve the situation; from the term applied to the mechanical device in the theatre by which the actor impersonating the deity appears from above the level of the other actors. —L.T.S.

**Deutscher Werkbund, (D.W.B.)** A German association (founded 1907) of artists, architects, industrial designers, manufacturers, and writers which, by means of publications, meetings and exhibitions worked towards an integration of the various groups and directions of the moderns. Recognizing the importance of machines in all the various fields of modern industrialized society, the *Werkbund* emphasized the fact that high quality (*Qualität*) is not restricted to handicraft, but is compatible with standardized machine production. The efforts of the *Deutscher Werkbund* contributed greatly to the formation of the modern style and it was this organization which made the public familiar with it (e.g. the *Werkbund* exhibit at Cologne, 1914).

The example of the German association inspired the founding of a *Werkbund* in Austria (1910) and in Switzerland (1913), the reorganization of the Swedish *Slöjdsförening* (1910-1917), and the founding of the English "Design and Industries Association", D.I.A., (1915).

The names of Herrmann Muthesius and Alfred Lichtwark are of importance for the development of the German *Werkbund.* Muthesius, who was instrumental in bringing about the organization of the *Werkbund,* was a member of the German embassy in London from 1896 to 1903 and was strongly influenced by English ideas. Alfred Lichtwar (director of the Hamburg *Kunsthalle*), who greatly admired English architecture, must be mentioned here not only in connection with the *Werkbund,* but also because he exerted a very great influence upon the reformation and spreading of art education in Germany. Thanks to the efforts of Muthesius and Lichtwark modern architects and artists were appointed to head art academies and art schools (e.g. Peter Behrens, Düsseldorf; Pölzig, Breslau; Bruno Paul, Berlin; Henry van de Velde [a Belgian], Weimar). This policy was continued and expanded under the German Republic and during the period 1918-1933 many of the outstanding modern artists were teaching in art academies or similar institutions (e.g. Hofer, Kolbe, de Fiori in Berlin; Baumeister, Beckmann in Frankfort; Campendonk in Crefeld; Paul Klee at the *Bauhaus* and in Düsseldorf; Otto Dix, Kokoschka in Dresden; Otto Müller, Molzahn, Kanoldt in Breslau; Rohlfs in Hagen; Schrimpf in Munich; Schlemmer at the *Bauhaus* and in Breslau). One of the most important appointments was that of Walter Gropius to the Weimar art schools (1919) which he reorganized and amalgamated into one institution—*Das Staatliche Bauhaus Weimar* (q.v. Bauhaus). See also GERMAN ART. See H. Muthesius, *Die Werkbundarbeit der Zukunft,* 1914 and *Der Werkbundgedanke in den germanischen Ländern, Österreich-Ungarn, Schweiz, Holland, Dänemark, Schweden, Norwegen,* 1914; N. Pevsner, *Pioneers of the Modern Movement from William Morris to Walter Gropius,* 1936; W. Riezler, *Die Kulturarbeit des deutschen Werkbundes,* 1916; H. Waentig, *Wirtschaft und Kunst,* 1909. The official publication of the *Werkbund* is the periodical *Die Form,* vol. 1, 1925. —H.H.

**deva** (Skt.). A divine being.

**devaloka** (Skt.). See stupa.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

**devarāja** (Skt.). See INDIAN ART. See SOUTHEASTERN ASIATIC ART.

**development.** *Mus.* See sonata.

**devotional image.** Any religious painting or sculpture made for purposes not of the cult but of private worship, no matter whether or not such purpose entails a modification of formal and representational character. In the case of Western medieval art devotional images, usually assumed the course of either the vivification of images of the cult or of the isolation and intensification of emotional traits found in historical narratives. By either process a humanization of the image was attained which made it easier for the individual worshipper to enter into an emotional relation with its subject. In their turn many emotional images are descriptive of visionary experiences which had been achieved through a sympathetic concentration upon isolated aspects of sacred history. See pieta; Christ and St. John; man of sorrow. —R.B.

**devotional ring.** See JEWELRY.

**dexter side.** See HERALDRY.

**dextrin.** This adhesive has an accessory use in the arts much like that of paste. Like paste, also, it is derived from starch, though when finally prepared it is a mixture of soluble starch with true dextrin and sugar. It has strong adhesive properties. —G.L.S.

**dhāranī** (Skr.). See stupa.

**dharmacakra mudrā** (Skr.). A mystic gesture symbolizing the wheel of the law or the gesture of preaching. Both hands against the breast. Left-hand palm inward, fingers bent. Right hand palm outward, fingers bent, certain fingers touching. —J.A.M.

**dhoti** (Skr.). Indian garment of muslin. A long loincloth draped so as to produce the effect of short trousers.

**dhyāna mudrā** (Skr.). A mystic gesture symbolizing profound meditation. Usually, hands in lap, three fingers extended, right overlapping left, index finger bent and touching thumbs. Sometimes, all fingers extended only thumbs touching. —J.A.M.

**diabolus in musica.** See tritone.

**diadema.** See tiara, papal.

**Diadoumenos** (Gr. from *dia* + *deo,* to bind, to fasten). Name given to a statue by Polykleitos listed by Pliny in his Natural History XXXIV, 55. The work represents a youth binding his hair with a fillet. There exist several replicas, the best of which is owned by the National Museum of Athens. The lost original is generally dated at about 430 B.C. For illustration see Gisela Richter: *The Sculpture and the Sculptors of the Greeks,* 1929, Figs. 650-652. —L.L.

**diagrammatic diagram.** See drawing.

**diagrammatic drawing.** A form of drawing practiced by scientists or those whose intention is merely to inform the observer.

**Diaguite culture.** See PREHISTORIC ART.

**Diana.** See Artemis.

**diaper.** In the 15th cent. *linge d' Ypres.* A fine cloth with small geometrical pattern. Originally a silk fabric from the Orient, usually white, used for ecclesiastical vestments. Now linen or cotton with simple woven allover pattern. —G.W.R.

**diaper pattern.** Generally, an allover repeat design of floral or geometric motives.

**diaphony (organum).** See MEDIEVAL MUSIC.

**diaphragm walls.** Walls, the primary purpose of which is to give rigidity to construction.

**Diasmetic notation.** See NOTATION.

**diatonic.** (1) One of the three ancient Greek musical genera: diatonic, chromatic, enharmonic. (2) Any chord, interval, note, or progression confined to the tones of *one* major (or minor) key or scale. See scales and modes.

**dichroism.** See COLOR.

**Die Brücke.** See expressionism.

**Dienst** (pl. *Dienste,* Ger.). The term refers to the long thin shafts—circular, semicircular, etc. in shape—which, primarily in German Gothic architecture, are arranged around a column and which serve the purpose of supporting and strengthening the column in bearing the thrust of the vaulting. The *Dienste* usually have base and capital. In late Gothic the capital is omitted and the *Dienste* join directly with the ribs of the vaulting. A pier with *Diensten* can best be compared with a clustered pier. —H.H.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

**Die Scholle.** The name of a group of Munich artists who (beginning ca. 1899) exhibited together and were prominent in the first decade of the 20th cent. Their work is characterised by an emphasis upon clear, strong colours and large, simplified shapes which are used to depict allegorical or idealized figures and scenes (e.g. Fritz Erler's decorative paintings in the *Kurhaus* in Wiesbaden). The best known members of the *Scholle* were the brothers Erler, Georgi, Münzer and Putz. —H.H.

**Dies irae.** See sequence.

**diffraction colors** are the colors of the spectrum as obtained by a diffraction grating.

**digital.** A key on the keyboard of an organ, pianoforte, harpsichord.

**diluent.** In paint technology a distinction is usually made between a fluid which will dissolve a film material such as oil or resin and one which will dilute another fluid already formed through such solution. The latter, called a diluent, can be described only in relation to certain specific materials. Petroleum naphtha, for example, is a solvent for dammar resin; i.e., it can disperse all of that solid and hold it as suspended matter, but it is only a diluent for mastic resin. —G.L.S.

**dime novel.** A generic name for inexpensive tales of adventure, combat, or mystery first published by Erastus F. Beadle in the U. S. in 1860 and immensely popular until 1915. Sneered at by literary critics and reprobated by moralists, these brief historical tales of the Liberty Boys in the American Revolution, of Indian warfare under such leaders as Buffalo Bill (William F. Cody), of romantic love carried on under frontier handicaps were composed by writers of at least second-rate ability in conformity to a strict moral code. Nick Carter, master detective, became a universal hero; Frederick van Renssalaer Dey, the author, said of his 1,000 tales, "I never in my life wrote a 'Nick Carter' that I would be ashamed to read to a Bible class." William Patten under the pseudonym, "Burt L. Standish," created the most popular athletic hero, a possessor of all the manly virtues, Frank Merriwell. The tales ran from 15,000 to 75,000 words, were printed on cheap pulp paper with a colored poster on the cover, were sold from 5 to 25 cents a copy, and usually were issued in a series once a week. In recent years they have been replaced by the pulp magazines (q.v.). Edmund Lester Pearson, *Dime Novels,* 1929. —H.R.W.

**diminished.** *Mus.* **Diminished interval:** A minor interval contracted by a chromatic semitone. **Diminished chord:** A chord, the highest and lowest tones of which form a diminished interval. **Chord of the diminished seventh:** A chord consisting of three minor thirds.

**diminuation** *Mus.* The repetition of a theme in notes of smaller time-value.

**diminuendo.** See NOTATION.

**diminutives.** See HERALDRY.

**dinanderie.** Decorative objects of brass, copper or bronze used for ecclesiastic and domestic purposes, such as those made in the 13th and 14th cents. at Dinand (now Dinant), Belgium. See METALWORK. —R.L.W.

**Dionysian.** See Apollonian and Dionysian.

**Dionysus** (L. Bacchus). A Greek fertility god, symbolized chiefly by wine and worshipped with ecstatic dances by his devotees, the Bacchantes, Maenads and Thyiades. His chief attributes were the wine cup, the thyrsus (a staff ending in a pine cone), and the grapevine and cluster. On a great number of vases, especially 5th cent. B.C., Athenian drinking cups, he was pictured with his accompanying Satyrs, Silens, and dancing girls, especially by the Brygus painter. In classical sculpture he was represented as a child being carried by Silenus or Hermes (as in Praxiteles' famous group at Olympia), as a bearded god somewhat resembling Zeus, or as a blithe youthful divinity. In later painting he was pictured by Leonardo, Titian and Tintoretto; and in sculpture by Michelangelo, Sansovino, Tacca, Begas, Carl-Nielson and Paul Manship. —W.R.A.

**diorama.** See STAGESETTING.

**diota** (Gr. *diotos* fr. *di-,* twice +*otos,* ear). In Greek, any vase with two handles, but usually an amphora (q.v.).

**diploïdion** (Gr. *diploidion* fr. *diploös,* twofold). Greek term for a woman's chiton with a double fold above the waist, in which the outer piece hangs loose.

**dipping.** *Cer.* Application of glaze by emersion. See CERAMICS I.

**dipteros.** See HELLENIC ART.

**diptych.** Two panels, generally designed as a

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

single composition. Used generally in connection with Japanese prints. *Book.* A folding writing tablet; a double codex, folding. See EARLY BOOKBINDING AND FINE BINDING.

**Dipylon pottery.** Athenian geometric vases, made in the 9th and 8th cents. B.C., are called Dipylon ware because they were found in the cemetery near the Dipylon Gate. They represent the finest examples of the Greek geometric style, which was brought to the Mediterranean by the northern invaders during the heroic age. These superb amphorae, over six feet high, were doubtless used as tributes at tombs. They are decorated with horizontal bands of geometric patterns (meander, zigzag, lozenge) and friezes of human and animal figures, likewise schematized in design, the men with triangular torso and angular silhouette. The drawings, in black on the terracotta background, represent for the most part battle scenes and funeral rites. —W.R.A.

**directed activity.** (art ed.) Experience with information and materials of art that is guided or controlled or supervised by the teacher. Whitford and Winslow in *Dictionary of Education.*

**directing line.** See PERSPECTIVE.

**direction** (in dance). See movement.

**Directoire style.** See FURNITURE.

**director.** *Motion pictures.* Theoretically the actual "author" of the film, supervising every process of production from the writing of the script to the final editing; more frequently in practice, the director's work is confined to the supervision of the actors and the placing of the camera. —I.B.

**direct painting, school of.** See POST-REVOLUTIONARY PAINTING AND SCULPTURE IN THE U.S.A.

**direct projection method.** See PERSPECTIVE.

**discant (discantus).** See MEDIEVAL MUSIC.

**Discobolos** (Gr. from *diskos*+*ballo*). The disc thrower. A famous statue by the Greek sculptor Myron of Eleutherai representing an athlete about to throw a quoit. The original is lost but the statue is preserved in several Roman copies. It is known for the new transitory movement of the body. The original probably dated from about 450 B.C. For illustration see Gisela M. A. Richter, *The Sculpture and Sculptors of the Greeks,* 1929, Figs. 578-582, and 583 on page 156. —L.L.

**disguised balance.** See balance.

**dispersion circle.** See COLOR.

**dissolve, the.** See cutting.

**dissonance.** See consonance, dissonance.

**dissonant interval.** See interval.

**distance** (in dance). See movement.

**distance of the picture.** See PERSPECTIVE.

**distance point.** See PERSPECTIVE.

**distemper.** A method of painting which uses an egg emulsion as a binding medium. The emulsion is made with egg-yolk, size or the white of an egg. Pure distemper as distinguished from tempera makes use of size only. —R.L.W.

**distorted seeing.** See PHOTOGRAPHY.

**distortion** (in dance). Hyperbole of movement, used as overstatement or understatement. Dance, like all the arts, distorts or exaggerates its medium that there may be a heightening of forces as a more effective stimulus, thus adding to its powers of expression and communication. To employ distortion artistically the dancer must first achieve an understanding and mastery of the normal. He is then free to deviate from it according to the demands of content and his artistic integrity. Artistically used distortion does not seem ugly or unnatural, for it is necessary to heighten expression of content. H'Doubler, M. N., *Dance, A Creative Art Experience,* F. S. Crofts & Co., 1940.

**distribution.** *Arch.* Arrangement of the parts, esp. in the interior.

**divergent pattern.** Definite motives receding from each other and moving from a common center.

**divertissement** (F. *divertir,* to amuse). *Mus.* (1) A light composition intended for amusement. (2) A medley of well-known melodies. (3) An entr'acte in an opera, i.e., a piece to be played between the acts. (4) In ballet, a single number, or suite of numbers aimed to display dancers, individually or in groups,

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

through short dances, unconnected by dramatic scheme, although sometime set in the pretext of a feast or wedding. In the classic repertory, they are placed as interludes in character situations (gypsies, peasants, children, etc.), or as steps preceding a grand finale or apotheosis. —L.K.

**divisi.** A direction for string instruments to play two different parts from the same staff, instead of double stopping.

**divisionism.** See impressionism.

**doctrine of emotions.** See MAIN TRENDS IN MUSICAL PERFORMANCE.

**dog tooth.** A type of ornament common in 13th cent. English Gothic consisting of radiating leaves suggestive of a dog's tooth.

**doki** (Jap.). Unglazed earthenware.

**dolmen.** A monument of megaliths suggesting a chamber.

**dome.** A large-scale cupola (q.v.); a polygonal or hemispherical vault.

**domestic.** Belonging to the house or household; concerning or relating to the house or family.

**domestic architecture.** Architecture pertaining to or concerned with the shelter and habitation of the human family group. The word domestic derives from "domus", Latin, for house.

As architecture has been primarily considered the art of designing public buildings serving religious or secular purposes, before the last century only the representational residences of wealthy families, of princes and church dignitaries were benefitted by the trained attention of especially commissioned designers, and then embodied many style characteristics of public or communal structures. Domestic architecture *per se* developed impersonally, and in its anonymity compares with folklore; a popular art production without specifically recorded authorship.

Domestic architecture has its beginning in the primitive furnishing of primeval natural abodes, such as birds' nest-like **bush shelters** and caves. It may be assumed with Violet le Duc and Gottfried Semper that original shelter construction consisted of roofs only, suspended by and affixed to a group of closely standing trees. Such roofs may have consisted of interlaced foliage-carrying branches, a thatching of large leafs of palm treets, aralias and other tropical or sub-tropical plants, or interwoven reeds piled up in several strata. Also the hides of killed game, we can assume, may have served as roofing material. The quickly deteriorable properties of all those items naturally accounts for it that no vestige of such early human dwellings are preserved, but certain similarities may be supposed with the primitive home making of natives in the Australian bush, the tropical woodlands near the upper valleys of African and South American rivers.

Contrasting with the openness of bush dwellings, caves with unmistakable traces of human shelter usage have been found in the moderate zones of the globe, especially in North America, Europe and Africa. The characteristic property of **cave dwellings** is the ease with which their often small outside access can be defended against aggression and weather attack, and the darkness and chill that called for the supplementation of fires built to furnish a minimum amount of light and heat. Only by this supplement the cave shelters were transformed into habitation. The tradition of a controlled room climate was initiated and produced a train of mental and domestic group activities, specifically conditioned by absence of violent air movement and by minimized change of moisture content and temperature.

Natural caves not found in abundance, were substituted for by walled windowless structures in rock, dobe or dirt and even of ice and snow (igloos of arctic tribes). The often clustered structures of neolithic pueblos continuousiy built and restored by settled native population in New Mexico and in remote arid zones of North Africa and Arabia, serve as examples of this early domestic architecture.

The bush dwelling on the one hand gave rise to the whole category of tectonically framed structures, from the nomadically portable tent of the grasslands with their scarcity of usable tree material, to the lake and lagoon dwellings, perched over the surface of inland- and sea-water in the European Alps or near the shores of Venezuela.

The dobe and natural stone dwelling on the other hand, induced to the techniques of brick making, brick baking, stone cutting and of joining the structural wall elements in stereotomic masonry. Arching of access- and light-openings and vaulting of ceiling spans were further consequences of these techniques and from domestic architecture, and were

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

later adopted by public and communal building design.

Instances of a combination of the tectonic and stereotomic routines of early domestic architecture are found in the use of lintels over exterior openings, of wooden roofs and ceilings born by masonry walls, and in the reed reinforced dirt walls of certain central African tribes.

Due to powerful infantile conditioning of inhabitants, domestic architecture is everywhere until recently characterized by pronounced conservatism and traditional repetition. The solid enclosure of the cave and cave-like dwellings remains for many generations in psychological dominance in all civilizations developing in the temperate and colder zones of the globe. Nervous adaptation to a certain type of sheltered interior and of external appearances expressing it, persist in spite of many technical changes, and even resisting the normal technical evolution.

The **family dwelling**, individually protective and defensible, although unknown in certain collective societies of primitivity, has remained a dominant, if often subconscious ideal in the occidental civilizations, and in the post-Victorian era has tended to an over-individualistic expression. A counter weight to this trend was furnished by the spread of multi-family, cellular apartment buildings in metropolitan areas, which however were devoid of elements expressive of domestic architecture. Modern large scale housing projects, (see housing) and long incipient prefabrication of standard dwellings for the masses of civilized populations, are more recently handled by expert designers, and mark the full fledged entry of industrialization into domestic architecture. Both traditional repetition and individualistic extravagance seem gradually to withdraw and dissolve under the pressure of this newly evolving era in domestic dwelling design.
—R.J.N.

**domestic art.** See household art.

**domicile.** A settled place of abode; home, house, or dwelling.

**dominant.** The 5th note of a major or minor scale. See idiom B(1).

**dominant key.** A key the tonic of which is either a 5th higher or a 4th lower than that of the principle key. See key.

**dominant seventh.** The dominant triad with a minor 7th added

**dominant wave length.** See COLOR.

**donsu** (Jap.). Figured damask.

**dorje** (Tibet.). See vajra.

**Dorian art.** See HELLENIC ART.

**Dorian mode.** See scales and modes; idiom A(2).

**Doric cyma.** Term applied to the hawksbeak (q.v.), the regular moulding of the Doric order.

**Doric frieze.** In classical architecture, the middle member of the entablature, over the epistyle or architrave; in the Doric order an alternation of triglyphs and metopes, two of each to each intercolumniation in Greek architecture, more later. —L.T.S.

**Doric leaf.** In Greek architecture, a decorative pattern consisting of a row of contiguous units of broad almost square shape with bottom corners rounded, each with a narrow tongue down the center stopping short of the bottom, and with a narrow border around the sides and the bottom; the regular ornament for the hawksbeak, the chief Doric moulding, also used on the cavetto. —L.T.S.

**dormitory suburb.** See CIVIC PLANNING.

**Doryphoros.** The most famous statue of a Doryphoros (Spearbearer) was made by the 5th cent. B.C. Greek sculptor, Polyclitus; its stalwart form embodies his ideal proportions for the male body (see canon). There are several marble copies of this bronze figure, the best of which is now in the Naples Museum. —W.R.A.

**dosa** (Jap.). A painter's sizing made of glue and alum.

**dotaku** (Jap.). An ancient bell-shaped metal form, the use of which is now unknown. See JAPANESE ART.

**double.** See RADIO DRAMA.

**doublé.** *Mus.* French term for turn.

**double action harp.** See MUSICAL INSTRUMENTS.

**double axe.** In Minoan Crete, a sacred religious symbol, made of gold or bronze, and represented on pottery, etc.; an axe with a double head of which the deeply concave sides connect the two convex blades which end in points at both ends. —L.T.S.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

**double bar.** *Mus.* The two vertical lines used at the end of a piece, or at the end of some important division of it.

**double canon.** See canon.

**double counterpoint.** See counterpoint

**double-deck street, highway, etc.** See CIVIC PLANNING.

**double fugue.** See fugue.

**double image.** Any image that allows simultaneously of two irreconcilable interpretations. Examples: a cloud appearing also as a human face or a mountain appearing as a recumbent lion. Such simultaneity is proper to primitive strata of the mind and therefore manifests itself most persistently in dreams, in the mentality of children and of the insane. In art it is used as an element of playful surprise as well as of the weird and preternatural; for the funny and the uncanny dwell close to each other. A frequent device in primitive and surrealistic art. —R.B.

**dovetailing.** See TAPESTRY.

**doxology.** Hymn or psalm in praise of God (Blessed Trinity). The *Gloria in excelsis* in the Ordinary of the Mass is known as the "greater doxology" in contrast to the *Gloria Patri* or "lesser doxology" which concludes the psalms. —V.A.

**drafting.** See drawing.

**dragon.** A mythical animal with head of a camel, horns of a deer, ears of an ox, eyes of a hare, heavy eyebrows, beard, bristles, tusks, the body of a serpent with scales of a fish, dorsal spine, serpentine tail, four legs with feet that combine the paws of a tiger and talons of a hawk. In Chinese art, the Taoist symbol of cosmic vitality. See SYMBOLISM IN FAR EASTERN ART. —J.A.M.

**dragon's blood.** This material is a resin strongly colored purplish red. In the arts this color has probably been its chief claim to use, for it has served as a stain in varnishes. The pure color can be extracted and no doubt has been employed slightly as a precipitated dye or lake pigment. It was definitely known as such to the painters of manuscript illuminations but is no longer listed among artists' colors. —G.L.S.

**dramatic lyric poetry.** See POETRY.

**dramatic oratorio.** See ORATORIO.

**dramatic poetry.** See POETRY.

**drawing.** The art of representing or delineating an idea, emotion or object by the use of line, tone, or color. A mode of expression making use of symbols or literary ideas. In a strict sense drawing is the most direct means of expressing the beauty of form. **Pure drawing** realizes the abstract character of drawing. It implies that certain ideas about form cannot be expressed by words.

Drawings are usually made with outlines or tones. The purpose of drawing is to express the gesture of the object drawn. The **gesture** is that quality in the object which stimulates the artist to draw. The commonly accepted interpretation of the purpose of drawing is **pictorial representation.** Thus pictorial representation and drawing are often used synonymously. This comparison implies that the aim of drawing is a literal interpretation of the object seen. However, this idea of drawing is not universally accepted. The Oriental conception, for example, implies that drawing is a medium through which the inner-self finds expression. Drawing and writing are synonymous to the Oriental since both allow the individual to express his idea. This point of view was also shared by the Greeks and has its devotees among the artists of the modern school. The Oriental artist develops his idea completely before beginning to draw. The academic school of art is opposed to this conception of drawing. The academician considers good drawing to be an exact representation of the things seen. In this style the artist develops his idea by drawing. This is referred to as **sketching.**

Drawing is similar to composition (q.v.) in that each line or indication of dimension must compose itself in the realization of form.

There are two types of drawing. The first is that which is used by the creative artist to define his ideas. The second type is variously called **mechanical drawing, drafting, engineering drawing** or **precision drawing.** The process is mechanically controlled and imports specific information to the reader. It is made with the use of mechanical devices such as rulers, squares, and compasses. It is called drafting. The mechanical draftsman often sketches without the use of instruments. This is referred to as technical sketching.

The desire for precision in drawing accounts for the term **correct drawing** which is used by artists to denote specific information conveyed through **free-hand drawing.**

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

Another similar type of drawing is **diagrammatic drawing** such as that practiced by the scientist where the intention is to inform the observer. Although the drawing is freely done it is not intended to be expressive, a minimum of precision being necessary to convey the specific information desired. —R.L.W.

**drawing, architectural.** The representation of architectural forms by means of lines.

**drawing, memory.** Representing an image on a surface through recall, from memory. Whitford and Winslow in *Dictionary of Education.*

**drawing, perspective.** Representation, on a two-dimensional surface, of two or three-dimensional objects surrounded by space so that they appear in the picture as they do to the eye. (Perspective drawing may be divided into linear and serial types each based upon special principles of representation. Linear representation may be divided into *parallel* or *one-point, angular* or *two-point,* and *oblique* or *three-point* perspective. The terms *curvilinear* and *rectilinear* are also applied to types of perspective drawing.) Whitford and Winslow in *Dictionary of Education.*

**Dresden porcelain.** See CERAMICS II.

**dressed.** *In masonry*: The term applied to stone which has been tooled or rubbed to a fairly smooth or even surface.

**DRESS, EUROPEAN.** INTRODUCTION. The study of man's dress is the study of mankind. Throughout the long and diversified record of human achievement, clothing has kept pace with man's development, leaving in each age a historical and philosophical record.

Over 8000 books have been written about clothing. Too few however have dealt with the subject from a purely scientific or philosophical aspect. The following remarks afford an outline approach to a philosophy of European dress.

Since clothing and adornment concern all peoples of the world, it is little wonder that there are so many different theories expounded concerning its origin. Most writers have their own pet theories. One or more of the following principles are frequently advanced:

1. Protection
   (a) From the elements
   (b) From physical enemies
2. Religious
3. Sex attraction
4. Economic
5. Modesty
6. Aesthetic
7. Social
8. Political

Assuming that adornment preceded clothing, what instinct in man prompted him to decorate his anatomical structure? Was it universal dissatisfaction with his naked form? Or was the cause more deeply rooted?

While each theory in itself invites a interesting argument, it is unsound to assume that any single isolated factor has directly influenced man either to adorn or clothe his body. The aforementioned factors are all so closely interrelated, each having a bearing in one way or another on the evolution of human dress, that exact differentiation is almost impossible.

No matter how time or geography have separated them, all the peoples of the world (past and present) are conditioned by their environment or mental attitude, and have been impelled by similar needs and desires which have led to the adoption of clothing.

Man's inventiveness throughout the ages has conquered condition. As a need arises, whether for bodily protection or spiritual expression, man's inherent skill surmounts the obstacle. He makes for himself tools with which to produce the necessities and comforts of life.

TYPES OF CLOTHING. Climate and occupational pursuits are determining factors as to the type of clothing used.

If intense cold forced man to kill the animal from which he removed the outer covering of fur in order to make a covering for himself, here is the beginning of one type of clothing—protection against the elements.

But does this theory stop here? What happened to man when he first put on this covering of fur? Was warmth all he sought? Or found? Was it reason that made man understand for the first time that the animal he hunted for food was also serving as protection against the elements? Was he awed at the first sight of himself when he donned the skin of the animal, or did he feel a strange magical power rising within? Did he assume some of the animal's attributes with its hide? Or did the animal serving his physical needs suddenly become a sacred being, one to be worshiped? Here are two intermingling influences, the protective and the religious, in man's first garment.

In tropical climates, uninfluenced by the need for warmth, primitive man resorted to body painting and then tattooing. Some of the theories given for undergoing this painful pro-

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

cess are permanent identity with the guardian spirit or totem, initiation, courtship and marriage rites. This is a beginning of decorative ornamentation that may be compared to textile or embroidery design.

Man also early discovered that parts of his anatomical structure lent themselves naturally to suspending ornaments. The girdle, necklace, anklet, bracelet, headband, earrings, fitted easily into the hollow structures of the body, which supported the infinite variety of decorative ornament of man's ingenious art invention. The girdle and necklace are regarded by some authorities as the objects from which the skirt, trouser and poncho (later tunic or shirt) developed.

SUPERSTITION. Many of the art inventions of primitive man are the direct ancestors of some of the forms of decoration, particularly jewelry, used by people today. This is most certainly true of charm jewelry. When ancient man strung together the teeth and claws of the animals he hunted, or made himself other forms of "protective ornament", he did so not merely to satisfy his aesthetic sense, or boast his prowess, but also because he was afraid. He wore these because he feared things he did not understand—darkness, spirits, elemental forces—and he derived confidence and protection from the symbols of other strong creatures, later gods. Thus, through superstition, evolved the good-luck token and other forms of jewelry worn all over the world.

From these crude beginnings may be gathered how primitive man set a culture pattern to which each age has contributed.

As civilization advanced and the mental outlook and the physical demands changed, clothing changed. The more activity there was in a given period, the greater the changes in clothing.

BEGINNINGS OF COSTUME IN EUROPE. This, then, advances clothing to the point where it is no longer merely protective or purely adornment, and takes on the form of costume, which implies definite characteristics of an era.

In the panorama of world civilizations, each era and each country brought costumes characteristic of the time and place, running the gamut of man's imagination, and expressing in each age his weakness and power, success and failure, wisdom and folly, simplicity and grandeur, and last but not least, his wealth In peace or war man reaches out in search of beauty, in search of change, seeking to satisfy his soul and reflecting it in his physical appearance.

Time and again, clothes for men and women were practically identical, differing mainly in the manner in which they were worn. For great periods of time in agricultural areas there was little change of style; when it did come it was to man's costume more frequently than to woman's. This remained historically true until the 19th cent., when male garments became semi-static and women's changed radically over short periods. This may have been a direct result of the passing of predominantly rural life, the rise of the factory and its influence on life and the products used.

THE RECTANGLE, THE CIRCLE, AND THE CUT TO FIT. Technically, from the point of view of cut, most garments are constructed on the rectangle, the circle, and the cut to fit.

With the rectangle, the draped costume which adhered to the human form was as full across the body of the garment as at the bottom, and depended on the wearer for its gracefulness. In ancient Egypt, Assyria, Greece and Rome the draped costume was worn, based more or less on the rectangle. Starting with the Egyptian loin cloth, costumes underwent various changes and additions, in tunic, sleeves and mantle. Even when the loin cloth or wrap around skirt of the Egyptians changed to the tunic form, it was still constructed on the rectangle and in later developments, smaller rectangles were attached at one or either side of the armscye to form the sleeves.

The circle, or parts thereof, enables fullness to begin at any given point, and extend to the desired length, culminating in graceful folds. In ancient times the circle was first employed in the Roman toga, which later became elliptical in shape, and in varying degrees the circle has continued right through the centuries as the basic cut of the collar, mantle or cape.

The cut to fit produces a garment shaped to fit a given human figure, and may also employ either the circle or the rectangle or combinations of both. The earliest known representations of the cut to fit are probably in the women's costumes as pictured in the early Minoan art. The garment fits the figure closely, with very small waist, from shoulder to hip, which can only be achieved by skillful tailoring.

WARFARE AND FOREIGN INFLUENCES. Factors that have particularly affected the evolution and change in costume in any era are warfare and foreign influences—political and social principles.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

The Romans and the Gauls were in constant conflict. Unaccustomed to the bitter northern climate of the barbarians, the Romans were led to adopt the warmer close-fitting trousers of the Gauls, which they wore under their tunics. The Gallo Romans gradually began to adopt each other's costumes.

With the fall of Rome, oriental influence centered around Byzantium and was reflected in the tunics so heavily weighted with embroidery and richly studded with stones that the rigidity of the fabric prevented it falling into folds.

War followed war, and the next great influence came from the Crusades. These two hundred years of martial pilgrimages took hundreds of thousands of men and women from Europe to the Near East, introducing them to strange new surroundings, clothing, materials and customs. The returning Crusaders brought back to Western Europe clothes totally different from their own, particularly the trouser and coat worn by Asiatic peoples. Magnificent fabrics and a wealth of jewels and metal work of the finest craftsmanship were incorporated into the garments, it was their pride to exhibit to those who stayed at home.

The foreign materials were adapted and embellished by the nobility and the wealthy clergy, and soon were emulated by the increasingly rich middle class and even the poor. Extravagance reached such heights that it became necessary to pass sumptuary laws, intended partly to curb the use of precious metals and jewels and the conversion of wealth into dress, but also partly to preserve class distinctions by limiting rich things to the nobility. As the classes continued to vie with each other or circumvent the existing laws, new restrictions were drawn up throughout Europe, limiting the use of fabrics and trimmings. When even these laws failed in their purpose, others were passed not only prohibiting the use of certain articles of dress, but even forbidding their manufacture.

THE CHURCH AND CHIVALRY. Of all the influences of the 1000 years succeeding the fall of Rome, none was greater or more all-enveloping than the Church. It regulated the life of all Western Europeans from the cradle to the grave, and even more importantly, after. Eventual salvation, was expressed in Christianity, was to be obtained only by adherence to the Church's rules, and the greater this adherence, the sooner and greater the reward. Men and women turned to the Church, and the age of monasticism reached its height. Even those not vowed to celibacy emulated or actually strove to achieve saintly existences; a natural expression of this came in clothing.

The flowing robes of monks and nuns were the models for the lay public. From the saints, and particularly the Virgin, women adopted the veil.

The elevation of the Virgin, as the intercessor for sinners, made a profound change in the status of women. The raising of one woman to such a position, the pattern thus set for other women, led to the elevation of womankind to a new position of respect and idealization, the core of the Age of Chivalry.

The relation of the sexes completely altered. Woman was raised to a pedestal, and emerged from the cloistered wife to a position of worldly understanding. Through the next four hundred years, there came an awareness of her womanly charms and although she retained the articles of costume, the robes, the veils, she expressed herself with new freedom in such ways as the low decolletage, and flirtatious arrangements of her draperies.

A prime factor in the evolution of men's clothing during the latter part of these 400 years preceding the Reformation was the development of armor from chain mail to moulded plates. The early link armor had hung loose over the tunics; the fitted plates required padded undergarments. Piece by piece solid metal replaced the yielding chain mail, and little by little men's garments became fitted to the body, heavily padded at the shoulders, thus minimizing the size of the waist. In the end armor completely encased the body, giving it a statuesque figure.

To preserve this heroic figure without armor, garments were stiffened or padded, stitched, puffed, or slashed, while trousers fitted close as tights, or added padding or quilting to make trunks. For the first time a sharp differentiation appeared between the costumes of men and women, and between clothing of Europe and Asia.

THE REFORMATION. With the opening of the 16th cent. there occurs such a sharp change in European costume trends that it is wise to suggest the probable thought shift which brought it about. After a thousand years of protective guardianship by the Church, with the Reformation man began to think for himself, untrammeled by spiritual restrictions. This freedom of thought found expression in increased activity in every direction, explora-

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

tion, discovery, manufacture, new materials, new uses, and from them all, new costumes.

This same period saw the decline of armor; during the 16th cent. man still preserved the padded and corseted effect in his clothing, now emulated by women to such an extent that it is often difficult at first sight to identify the sex of a waist-length portrait. Gradually, during the early 17th cent. men turned to easier dress, but women retained the corset and hoop to a greater or lesser extent for three more centuries.

Was it social unrest that led both men and women to distort their bodies with artificial restrictions, or was "all the world a stage" and they the players, to exhibit their wealth on their persons?

Queen Elizabeth set the criterion for a whole era, an important emergence of woman as an acknowledged ruling force. She surrounded herself with a male court; she also surrounded herself anatomically with a farthingale, a barrel-shaped frame of Spanish influence, in which she resembled a dressing table in motion. Further, she laced her body flatly into a narrow corset; adorned herself with huge ruff, or upstanding collar; padded roll at the armscye, and stomacher copied from the men. Was this a form of subjugation of the more plentiful physical charms of her ladies until, as she grew older, by sheer wealth of dress she could surpass them to the eye as she did in mind and in rank?

From the age of Elizabeth to the 18th cent., individualism and the expression of personality emerged in full flower. The spirit of "newness" brought with it a new silhouette sequence, each distinctive in form and cut. No longer desirous of accepting anything medieval, woman threw off her trailing robes and concealing veils, and encased her body in a steel corset and iron or whalebone hoop. Over these were laid the rich and elegant fabrics of the Renaissance, and there emerged woman, a funnel-shaped silhouette. The emphasis in woman's dress was from waist to floor, in man's from shoulder to waist.

Although from the 17th cent. on men and women differed in the styles of their garments, nevertheless a certain other resemblance remained paramount until the French Revolution—a tendency toward elegance, lace, ribbons, and the use of other decorations, which increased in richness and profusion in both sexes to a point of effeminate softness, often reflected in the morality of social life. The development of the industries which produced these elegancies grew with leaps and bounds, and was encouraged by the increased application of the product.

THE FRENCH REVOLUTION. If one retraces step by step the historical events of each period, one discerns that each great social change is preceded by a period in which there seems to be some spiritual recognition of the end of an era, a final flowering, a last ebullience, which expends itself in the refinement of luxuriousness, brilliant colors, fantastic exaggeration, but little real invention, the going-to-seed of the plants of culture before the new sowing.

Such a period existed in the quarter-century preceding the French Revolution. There were three classes, the nobility, the bourgeoisie who aped the nobility, and the common people who mattered not at all, barely covering their nakedness with homespun. Costume reached heights of exaggeration in silhouette and embellishment as false and superimposed as the society itself was superimposed on the restless masses of the people.

The Industrial Revolution had begun its upset of thousand, even three thousand year old traditions of living: machinery and the men to run it were shifting the populace, ruining old industries, creating new. The nobility and the bourgeoise strove to retain their old privileges, and secure advantages from new wealths. The pace of living became more and more artificial, more hectic; fashion followed the will-o-the-wisp of errant whim; living and thinking were chaotic and momentary, "après nous le déluge".

When it came, "le déluge" was so strong, so all-embracing that it changed all society, all customs and all costume with startling abruptness. Almost overnight, costume broke free of the corset, hoop and wig, and long trousers for men made their first modern appearance.

The influence of foreign wars and conquests reflected in the Greek renaissance, in Egyptian and Roman classic décors. Simplicity was the rule, admiration of the human form the base of male and female dress. For about thirty years the active spirit of a world at war kept fashion simplified.

THE NINETEENTH CENTURY. Increasing facilities for travel and communication, commerce, growth of manufacture, the invention of the sewing machine, a desire for knowledge and the availability of fashion magazines, all opened up new horizons for women of the 19th century. Heretofore man had played the dominant role, and was also the arbiter of

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

fashion. From now on a gradual standardization of man's dress develops, while that of woman changes more rapidly.

What brought about this radical change of dress? Was it the influence of two reigning personalities, Empress Eugenie and Queen Victoria? Or in asserting her new increasing spiritual freedom, was woman still clinging to man? Was she subconsciously accentuating her moulded torso from the waist down, encasing it again in a frame as women had done in the days of the Reformation when first freed of the shackles of medievalism? Was she wearing crinolines, hoops, bustles or pads as a means of distortion in order to attract attention—or was the exaggeration merely a madness of fashion?

The second half of the 19th cent. saw woman entering the economic world. With this new freedom, the distortion of the feminine form gradually disappeared and emancipated woman went forth untrammeled to take her place in the world.

MODERN COSTUME. Fashion in history has had phases of beauty, genius and madness. It has set the tempo of life of each period. It has had spurts of grandeur and simplicity. It has been affected throughout thousands of years by recurring cycles of world events, each manifesting itself in the pattern of life. Perhaps a realization of causes and their effects on costume may be found in the U.S.A. in the present World War II.

American costume begins with the 18th cent. Prior to that the Old World settlers in the New World continued to wear the clothes of the mother country. When their garments wore out they sent back for more, adapting them to their new mode of life. By the 18th cent. the colonists were established in their new homes and acclimated to the life in the New World—a leisure class had appeared to take an active interest in dress.

Costumes of the fashionable gentry were imported from France—Paris being the world center of luxury, leisure, fashion and taste. This leadership began during the reign of Louis XIV and was supported and favorably encouraged by the French Government, and in the past century by the American Fashion Press. It maintained its leadership until the fall of France in June, 1940.

Deprived of Paris leadership, American fashion began emerging on its own and is now beginning to be recognized, heralded and headlined along with other world events in the American newspapers of today. Historically, American Fashion begins with World War II.

CONCLUSION. Thus from man's garments which began as adornment or clothing, costume has evolved. This in turn has developed into one of America's major industries, known today as "Fashion".

Man's dress began with the dawn of civilization. It was invented by man because he needed it. It has survived because man still needs it. It will continue to survive as long as man has ideas and an opportunity to fulfill these ideas.

Man himself has been faced by physical, spiritual, social and geographical obstacles, which he has conquered by means of inherent creative ability. This conquest is written in man's dress throughout history and is expressed by the means and manner in which he invents and adapts materials beneath his hand.

He is standing in the dawn of a new age, an age of Synthetic creative invention. He is discovering the bowels of the Earth; he is discovering the might of the elemental forces. He is discovering a New World in which he will live—but before he can begin to live in this New World, he must first discover himself and his relationship to the new society in which he will live. Through this relationship will emerge the silhouette of the future. See JEWELRY; also *Ancient Egyptian, Assyrian and Persian Costume,* Mary G. Houston and Florence S. tion to certain goals; continuity; particularly applied in climaxes, by accumulating small rhythmic values, increasing speed, harmonic tension, dynamic volume, etc. —E.K.

**drolery.** The playful use in Gothic art of freely invented scenes or figures to give attraction to the functionally empty parts of architecture, furniture or books. Like other manifestations of medieval "humor" drolery is usually satyric or paradoxical and often borders upon the uncanny and demoniac. It takes the form of (1) scenes composed mainly of bizarre imaginary creatures, (2) animal fables, (3) the reversal of the cast of parts in real life (animal hunting the hunter), (4) jocular description of every day activities. —R.B.

**drop folio.** *Book.* The number at the bottom of the page of folio identification.

**drum.** *Arch.* One of the circular or near circular sections that go to make up a column: a circular or polygonal wall carrying a dome or cupola. See also MUSICAL INSTRUMENTS.

**drumprinting.** A printing process for worsted and woolen yarns in the manufacture of velvet carpets. See velvet.

**dry.** *Cer.* Insufficient glaze. See CERAMICS I.

**drying oils.** All the oils used in painting come under this head. Among them are linseed oil, walnut oil, and poppy-seed oil. More recently, though with little invasion of the field of artists' materials, different oils have come on the commercial market—tung oil, soya bean oil, sunflower oil, hempseed oil, and others. These oils have the property of forming, when exposed to the air in thin layers, solid elastic films. The process of drying or setting is largely chemical and can be briefly described as an absorption of oxygen into the complex oil molecule. Various physical changes accompany this: an increase of weight and a slow thickening. The process is a long one, continuing in some instances for a period of many years. Certain optical changes occur with it, often a slight yellowing, particularly if the oil is not exposed to normal light, and a slight increase of transparency. Linseed oil in the final dried film goes by the name, linoxyn. Over a long period it loses some of its elasticity, becoming brittle and subject to the action of moisture. The history of drying oils in the practice of painting has been open to much dispute. The generally accepted belief of the last two or three centuries has been that the Flemish painters, the brothers Van Eyck, were responsible for its introduction. More recent study, however, has shown that at least in the crafts and certainly in medicine, the drying oils were familiar to the ancient writers, and descriptions of the preparation of an oil varnish—a combination of resin and drying oil—are found as early as the 8th cent. By the 12th cent. such records are numerous and by that time drying oils are mentioned as painting mediums. —G.L.S.

**drypoint.** *Etch.* A print made by the passage of a sharp point over a copper plate, raising a burr which holds the ink. This burr, which yields a rich velvety dark in printing, gives drypoint its distinctive character and charm. No acid is used; hence the term, drypoint. See PRINTS AND PRINT PROCESSES. —K.K.

**drypoint (an intaglio process).** *Etch.* Drypoint is a process which does not depend upon an auxiliary in the form of an acid to do the actual spadework. It is nearer engraving than etching.

Drypoint is one of the simplest of the intaglio processes to practice. All that one requires is a bare plate, a point (usually steel), a scraper, an oil stone, a burnisher, and some ink mixed with vasoline to show the progress of the work.

The peculiar beauty of this medium is dependent upon its power of yielding a wonderful velvety richness in the proof. This is due, not to the groove which is cut below the surface, but to the **burr**, or **ridge**, thrown up by the passage of the tool. It is the burr that catches and holds the ink on the surface of the plate during the action of wiping with rag or hand. If the burr is removed with the scraper or becomes worn off in the printing, the line below holds comparatively little ink, and the distinctive quality of the medium disappears. Usually the burr is retained in the heavy passage and removed in the delicate ones. Drypoint has a tremendous range in strength of line, far exceeding anything produced by etching.

The drypoint is extremely fragile, the usual edition being about thirty. If the plate is faced with chromium steel a great number of proofs can be pulled without injuring the delicate burr or any noticeable change showing in the proof. —K.K.

**dulce-melos.** See MUSICAL INSTRUMENTS.

**dulcimer.** See MUSICAL INSTRUMENTS.

**dummy.** *Book.* A book made up of blank sheets, or with title and contents only as sample for size and appearance; generally used in estimate of size, cost, etc.

**Duncan Phyfe,** 1768-1854, was a native of Loch Fannich, Scotland. Reaching America with his family at sixteen, he was apprenticed to a cabinet-maker at Albany, New York. By 1792 he was established in New York with his own joiner's establishment, marrying shortly afterwards and changing the spelling of his name from Fife. With growing success he established his shop on Partition (now Fulton) Street. During his long and prosperous career he enlarged his shops, added warehouses, employed many workmen, and associated with him in firm membership two of his sons.

As a furniture designer he outranks other American craftsmen of the time, revealing both manual dexterity and artistic taste. Combining Sheraton, Adam, and Hepplewhite grace with the ornateness of French Directoire, he achieved in his earlier work an original synthesis which rooted the European tradition in American soil. As time went on his restraint relaxed and with his **American Empire** he allowed the heavier forms popular at the time to control his style. His finest pieces in the 18th cent. English mode were made by 1814; in a graceful Anglo-French manner by 1825.

His pieces include principally chairs, sofas, and tables. Characteristic motives are lyre forms for chair backs and table supports, parallel rows of beads, acanthus leaves and outward curves on supporting members, and drapery swags. Good proportions are patent in all his best work. His preferred wood was mahogany, usually solid, but veneered on occasion. He also used satinwood, rosewood, even maple, and before his retirement was following the fashion in the employment of black walnut. Choice pieces by the master or his workmen are representative of the best of American furniture in the first half of the 19th cent. See FURNITURE; see C. O. Cornelius, *Furniture Masterpieces of Duncan Phyfe,* 1922; N. V. McClelland, *Duncan Phyfe and the English Regency, 1795-1830,* 1939. —W.S.R.

**Dura-Europos.** City of the Euphrates, in ruins since 265 A.D. Excavations by American and French expeditions (since 1932) discovered, in addition to monuments of Parthian, Hellenistic and early Christian art, the remnants of a synagogue with well-preserved frescoes. These represent stories of the Old Testament and are the only known examples of wall paintings in an antique synagogue. The frescoes painted between 245 and 256 A.D., are significant for their iconography and their stylistic relations. There are, however, wall paintings in the Jewish catacombs: Palmyra (2nd cent. A.D.), Rome (3rd-4th cent. A.D.). See M. Rostovzeff, *The excavations at Dura-Europos,* 1936 and *Dura-Europos and its art,* 1938; M. Aubert, Le peintre de la synagogue de Doura, *Gazette des Beaux-Arts,* 1938; R. du Mesnil du Buisson, *Les peintures de la synagogue de Doura-Europos,* 1939; Elizabeth Hill, *Roman elements in the settings of the synagogue frescoes at Dura, Marsyas,* 1941. —H.Gu.

**duration.** *Mus.* See NOTATION.

**durchkomponieren** (Ger.). See thoroughcompose.

**Düsseldorf, school of.** The term refers to a type of painting (fl. ca. 1830-50) that was closely associated with the Düsseldorf academy of art—one of the centers of *Biedermeier* art (q.v.) The Düsseldorf academy, founded in 1767, was closed in 1805 and reopened by the Prussian government in 1819. Peter von Cornelius was its first outstanding director (1821); he was followed in 1826 by Wilhelm von Schadow with whom the rise of the Düsseldorf school begins.

The style of the Düsseldorf school could be described as a compromise between the heroic-romantic tendencies of the late phase of German Romanticism, especially of the **Nazarenes** (q.v., also GERMAN ART), and the genre painting of Biedermeier art. In the historical paintings, the result of this compromise could be characterized as heroic genre. In landscape painting the landscape is often loaded with "inner meaning", conveyed by means of objects and figures saturated with sentimental associations.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

Cornelius and Schadow were both Nazarenes, but Schadow, being an outstanding teacher, did not force his pupils to follow his interests exclusively—thus landscape and genre painting developed somewhat against his intentions. Schadow had carefully worked out a curriculum which, beginning with drawing from plaster casts, proceeded to the study of drapery and the copying of works of great painters. After this, came the study of composition, which began with a drawing of the central idea of the painting to be followed by careful studies of the details from a living model. This procedure—sometimes referred to as Düsseldorf "realism"—was supposed to allow "nature" to serve as a corrective and control during the final working out of the painting. Schadow's method, which was greatly acclaimed, produced in a short time a number of successful painters whose work showed the stamp of the "school", thus spreading its fame. Many of the Düsseldorf pupils were appointed to teach in other academies or at Düsseldorf itself.

Typical of the historical genre are Lessing, Hildebrandt and Bendemann; A. Achenbach represents best the Düsseldorf landscape painting, while Schrödter and Hasenclever are characteristic of the humorous genre. Alfred Rethel, a student of the Düsseldorf academy, is perhaps the only painter who, in his historical paintings, continues the heroic-monumental tradition of the Nazarenes rather than following the trend of the Düsseldorf historical genre painting.

Some of the Düsseldorf painters were strongly influenced by English artists, especially by William Collins and David Wilkie, e.g. Rudolf Jordan, Henry Ritter (born in Canada), Adolf Tidemand (born in Norway).

The Düsseldorf school has exerted some influence upon painting in the United States—its influence can be seen, for example, in the works of Emanuel Leutze, Worthington Whittredge, Albert Bierstadt, Eastman Johnson and others. See Wilhelm von Schadow, *Der moderne Vasari,* 1854; Wiegmann, *Die Künstlerakademie zu Düsseldorf,* 1856; Fr. Schaarschmidt, *Zur Geschichte der Düsseldorfer Kunst,* 1902; K. Koetschau, *Rheinische Malerei in der Biedermeierzeit,* 1926. —H.H.

**dust cover.** *Book.* The paper cover on a publisher's binding; the same as jacket.

**Dutch art.** See NETHERLANDISH ART.

**Dutch glass.** See GLASS AND GLASSMAKING.

**Dutch metal.** *Book.* In leaf and powder. An imitation of gold for gilding. It has not the depth of color of gold and "goes off."

**Dutch porcelain.** See CERAMICS II.

**Dutch Renaissance.** See RENAISSANCE.

**dux.** See fugue; counterpoint.

**dvarāja.** God-king. The king or the symbol of the king who rules by divine right as the god's representative.

**dye.** A coloring matter, to be called a dye as distinct from a pigment, is one which can be used in solution as a stain. The pigment is relatively granular, the color being contained in fixed or definite particles which are suspended in a medium. Dyes are generally organic, chemical compounds, and in the arts until comparatively modern times they were of natural origin; e.g., madder and indigo. The development of coal-tar as a source of dyestuffs has brought into the market an innumerable series of high tinting strength. The greatest use of dyes has been for the coloring of fabrics, but a few have been precipitated on a mineral base and used in that form as painters' pigments. See COLOR.
—G.L.S.

**dyeing** (AS. *deag,* color or tint). For modern usage all dyes are synthetic. Synthetic dyes were discovered in England by Sir Henry Perkins, developed in Germany, later in the U.S.A. Previous to the 20th cent., animal, vegetable and mineral substances were used directly, or mordanted on material.—G.W.R.

**dynamic.** The adjective dynamic comes from the Greek word *dynamikos* and means "powerful." Originally it was applied only to physical forces. In philosophy it means the reduction of all existence to a reciprocal relation of moving forces. Since the philosopher Leibniz, this external interchanging play of forces was thought to be related to an analogous procedure in the spiritual being within us. Since the World War this word has been increasingly applied to art, culture, and history. To Spengler, in his *Decline of the West,* dynamic is the essential attribute of the *Faustian* man, Müller-Freienfels, in his book, *Persönlichkeit und Weltanschauung,* 1919, contrasts the dynamic type of man who looks at the world as being in eternal motion, with the static type. See also Troeltsch in *Die Dynamik der Geschichte nach der Geschichtsphilosophie des Positivismus,* 1919.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

In art the word dynamic means the characterizing attribute of those artists who believe that all things are an indefinite interchange of forces influencing each other and who express this belief in their art. The word can also be applied to the works themselves. Generally speaking, one may say that the northern people have a dynamic point of view; therefore their works especially should be called dynamic. One can compare Germanic applied art of the time of the migrations (beginning in 375 A.D.) with their southern originals which served them as patterns and which show a static character. Or one may compare images of the evangelists and Biblical scenes of a static nature originating in the South with those of the Carolingian epoch which are based upon the southern pattern, as can be proved. The result of this transition was a wholly dynamic art.

Besides this general difference between different peoples, each art shows dynamic tendencies toward the end of its development.

—A.J.S.

**dynamic sculptures.** See SCULPTURE.

**dynamics.** *Mus.* The scientific explanation of the relative force, intensity or loudness of musical notes. The five main dynamic degrees are: pianissimo, piano, mezzo, forte, fortissimo.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

# E

**Ea.** Babylonian god of water, of the arts and sciences, etc.

**EARLY AMERICAN ART.** When we speak of "early American art" we are commonly referring to the artistic output of the New England colonies before the Revolution, particularly in the field of the so-called plastic arts, architecture, sculpture, and painting.

It is customary in such a discussion to ignore the Amerindians as belonging to an earlier and more primitive culture, requiring special treatment under a separate heading. This is especially reasonable since native forms of art, limited as they were almost exclusively to the Pacific Southwest, exercised no perceptible influence on the artistic development of the early settlers.

Excluded with less reason, perhaps, from a discussion of early American art is what has come to be treated separately as Spanish-American or Latin-American art (q.v.). This again, however, though in a different sense, belongs to a separate culture, which has exercised little or no influence on the artistic development of North America. For the purposes of this discussion, therefore, we shall be concerned only with the narrow strip of land along the Atlantic coast whose history for us begins with the first settlement at Jamestown, Virginia, in 1607.

The civilization of the Atlantic coast of North America had to be built up from the crudest beginnings, and its earliest contributions to art were of necessity also crude. The early English, Dutch, French and Swedish settlers lived a very primitive sort of life, and produced nothing at first which could properly be termed art. Certainly their early dwellings could not be dignified by the name of architecture, even when they abandoned temporary shelters for more permanent structures. By the middle of the 17th cent., however, they were building steep-roofed, gabled houses with overhanging second stories reminiscent of medieval England, and filling them with furnishings and utensils brought from the Old World. Primitive as these still were, they were characterized by good taste generally and had many charming qualities besides.

While the Spaniards were introducing to this continent the mature and often overripe art of the last flowering of the Renaissance in Europe with the object of proclaiming the grandeur and power of Spain, the settlers of the New England colonies were making their own way with little or no cultural or economic aid from abroad. Besides, the early Puritans had no use for art in any form, their emotions finding their only legitimate outlet in religious fervor. Any attempt to please the eye was regarded as a diversion from the main purpose of serving God. But, although it was deliberately excluded from their way of life, innate artistic instincts could not be permanently inhibited, and by degrees, helped by the influx of more liberal elements, a civilization developed in which art increasingly played a part.

Early 17th cent. architecture in the New England colonies was primarily the work of builders and craftsmen who rebuilt from memory on American soil the structures they had known in the Old World. These were substantial and livable in character, as were the houses of medieval England which served as their models. They were similarly well proportioned structures, solid, massive, largely of wood, well adapted to the climate and to existing social conditions. Many of these 17th cent. houses are extremely pleasing to the eye, having not only the charm of simplicity but good proportions and adaptability to use, all attributes of good architecture. While the

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

aesthetic motive did not enter deliberately into their calculations, their builders built as well as they knew how, and among them were men of sound artistic judgment.

Although the British influence predominated, other nationalities left their mark architecturally in certain localities. The French in 1608 established themselves in Canada, at Quebec, and a century later (in 1718) at New Orleans, where they developed a cavalier civilization based upon social and economic conditions much more affluent than prevailed in the New England states. The Dutch, settlers of New Amsterdam, have also left an architectural heritage which is still in evidence in the New York of today. They followed the architectural patterns of their homeland in tall, narrow brick buildings not entirely suited to their New World environment. The Swedes, who in the middle of the century had a foothold temporarily at the mouth of the Delaware, never got farther than building what were probably the earliest log houses, largely defense structures, which were also patterned after the buildings they had known at home. The Germans likewise in Pennsylvania erected structures which reflected their nostalgic longings for the mode of life they had left behind them in the Old World.

18th cent. architecture in America reflects a greatly advanced standard of living, and the amply proportioned houses of that period were consciously designed with a view to pleasing the eye. These buildings are strikingly different from the unpretentious structures of the 17th cent., although they still reflect British architectural influences and ideals, being classified as **William and Mary, Queen Anne,** and **Georgian,** after the British monarchs whose reigns fall in this period. Many fine 18th cent. houses may still be found today in the Atlantic coast states which are models of good taste in both exterior and interior design. The Colonial Wing of the Metropolitan Museum in New York contains a series of representative interiors of this period.

The most striking example of the beauty of 18th cent. architecture may be seen in the recent reconstruction of Williamsburg, the colonial capital of Virginia, founded in 1690. Restored to its original form, it serves as a great outdoor museum of colonial architecture and civic design. As a monument to the good taste of colonial America, it should inspire future generations to solve their own problems with similar regard for the importance of art in the life of the community.

If the art of sculpture flourished in the colonies it has left no trace, and there is little evidence that sculptors found employment unless it was in the decorative ornamentation of buildings or perhaps in those naive manifestations spoken of as folk art. The figureheads of ships may possibly be regarded as samples of the sculptor's art, but apparently no public monuments were erected in the colonies before the Revolution.

The economic and social conditions which retarded the development of painting were even more effective in delaying the appearance of sculpture as an independent art. The early colonists brought no sculptures with them. Moreover, since sculpture is so largely concerned with the human body, the association of flesh with the devil was sufficient for the Puritans to bar sculpture from their lives.

In the 18th cent. what little there was of sculpture was largely the work of foreign artists. A notable exception was Patience Wright, whose portraits in wax became fashionable during the middle of the century. Occasionally plaster casts of classical statuary were imported from Europe, but largely for the private enjoyment of the well-to-do. The figureheads of William Rush, 1756-1833, were famous in their day, but none of these has survived. Rush was one of the company of those who in 1794 advocated the establishment of an art school in Philadelphia, which project, however, was not realized until 1805, when in Independence Hall seventy-one public-spirited citizens gathered to organize the Pennsylvania Academy of the Fine Arts, historically the oldest art school in the United States.

The number of paintings produced in the colonies is more impressive. Portrait painting did quite a flourishing business in the 17th and 18th cents., but can hardly lay claim to artistic distinction. Worthy of mention, however, are the so-called "primitives," who are highly regarded by those who react favorably to the naive qualities of these unskilled workers. Many of these early portraits bear no signature, but we have today an imposing list of names of persons who painted portraits as a means of gaining their livelihood. Practically all came from abroad, but few of them had ever studied drawing or painting as a preparation for their chosen profession. They were in their day spoken of as **limners,** a term derived from the medieval illuminer or illuminator of manuscripts.

Because of their unique methods no more interesting group of workers is to be found

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

in the annals of American art, and their work is widely collected today both for its historic interest and for its quaint character. Many museums have also included the work of limners in their collections of early Americana because of the important role played by them in the history of American art.

While the early colonists brought few pictures to the New World, they brought with them a tradition of fondness for family portraits. In the 17th cent. relatively few of such portraits seem to have been painted, but in the 18th cent. the limner plied a lucrative trade. While the Puritan fought shy of the emotional upsets which contact with art might bring, he was not above the vanity of employing some itinerant portrait painter to record both his own likeness and those of members of his family, and a good many of these portraits have come down to us from colonial days. The work of the rank and file of these early limners is undoubtedly crude, without any structural solidity or plastic expression. The color is a brown monochrome and the technique is lacking in spontaneity and life. Considering the methods employed, however, this was inevitable. The winter months were spent at home in their studios in the preparation of numerous stock portraits in which everything was completed but the face. In the summer they went on the road, calling upon prospective patrons and visiting plantations and estates, where they were usually sure of finding a welcome. A single sitting commonly sufficed to complete a portrait, and the price was accordingly modest. They worked rapidly, and often earned a good income. They did not hesitate to advertise in the manner of the modern purveyor of medical panaceas, and they took every advantage of the opportunities offered by the New World.

The honor of being the first painter in the colonies goes to Capt. Thomas Smith who did a self-portrait in 1690 and a portrait of Major Thomas Savage inscribed 1679. William Dunlap, himself a painter of moderate ability but a faithful chronicler of the limners, many of whom he knew personally, in 1834 published his two volumes entitled *A History of the Rise and Progress of the Arts of Design in the United States.* In this work he accounts for the interesting company of those who constitute our Primitives—although it must be understood that their performance is not comparable to that of the Italian Primitives, who were craftsmen and artists of a high order. Mr. Dunlap's voluminous two volumes have recently been condensed and revised to include more recent discoveries, and this work will doubtless continue to be the most important source of information in regard to our earliest painters.

As in the case of architecture, painting gradually improved, and the work of the portrait painters who immediately followed the limners occasionally approached professionalism in quality. Robert Feke (1705-?), Matthew Pratt (1734-1805), John Smibert (1688-1751), John Greenwood (1727-1792), John Wollaston, ygr. (1672-?), John Hesselius (1726-1778), Joseph Blackburn (?), and Charles Willson Peale (1741-1827) show qualities in their work which entitle them to a higher rating than that accorded the limners, and thus prepare the way for the emergence of a group who may be called our first professional artists.

In the 18th cent. a number of really outstanding artists emerged, all American born, whose work belongs only partly to the period under discussion, since their lives and careers carry over into the post-Revolutionary era. These were John Singleton Copley (1737-1815), Benjamin West (1738-1820) and Gilbert Stuart (1755-1828). Copley, a Bostonian before his departure for Europe in 1774, had prospered at home as a portrait painter, and his numerous portraits of colonial dignitaries, divines, merchants, and their womenfolk are by far the best pre-Revolutionary portraits produced in America. When he settled in London, he came under the influence of the British masters Reynolds and Gainsborough, but while his later portraits are marked by greater refinement of form and color, they lack the sturdiness and objective power of his work done in the colonies. Copley also painted numerous historical canvases, among them *The Death of Lord Chatham,* which helped to establish his reputation in England.

Copley's methods were slow, and he required many sittings. His work, as a consequence, lacks spontaneity, although his compositions are occasionally lively and his color gay, particularly in the accessories.

Whereas Copley was a solitary figure and avoided public life, Benjamin West, on the other hand, became a noted public figure in England. Born in Springfield, Pennsylvania in 1737, he left the colonies when in his early thirties, after having impressed his friends at home by his talent and his ingratiating and likable personality, which was to play no small part in his rise to the position of court painter of George III, and to the presidency of the Royal Academy, which he had been

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

instrumental in founding. In spite of his worldly successes, however, West's work is not highly regarded today. His preoccupation with moral values stood in the way of his producing really great painting. His vast canvases devoted to religious and historical themes seem empty, dry and uninspired. Sometimes in portraiture he succeeded better, but he never displays the robust quality of Copley nor the latter's power of characterization. West's school in London, howeper, was famous in its day and was the goal of all American artists who went to Europe for study. His generosity, his kindliness, his affability, cannot be denied, and it is to be regretted that his performance as a painter is so often remembered only to be held up to scorn.

Gilbert Stuart is today justly called our old master, his work being still highly esteemed for its fine qualities. His career as well as his personality and traits of character, were very different from West's. West was a conformist, Stuart an individualist. As compared with both Copley and West, Stuart was highly temperamental, with a colorful, often irascible nature and noted for his caustic wit. Irresponsible in his business relations, he was nevertheless a very gifted painter of portraits, conspicuous for their spontaneity and insight into human character. His work is limited to portraits, but within this limited range he produced masterpieces. His portrait of George Washington, the so-called Athenaeum Portrait, hangs in the Boston Museum of Fine Arts and has become the accepted official likeness of Washington.

Copley, West and Stuart represent together the culmination of colonial achievement in American art. The 19th cent., into which their carreers entered, artistically fell into a decline before it rose again to significant and high attainments. See Fiske Kimball, *Colonial Architecture;* Suzanne La Follette, *Art in America;* Eugen Neuhaus, *The History and Ideals of American Art.* —E.N.

**EARLY BOOKBINDING AND FINE BINDING.** The desire to decorate the articles that he made is reflected in man's early attempts to devise for his writings a covering that would not only embellish them but also protect them. The form of early binding varies with the method used in making the primitive "book." The Babylonians (800 B.C.), who incised their cuneiform characters on clay tablets, covered the baked tablet with a second layer of thin clay on which was inscribed the title. To read the tablet it was necessary to break off this outer covering. The Egyptian papyrus "books" were first enclosed in wooden cases and then later folded in accordion folds not unlike oriental books today. In the ruins of Pompeii were found **diptychs** or two leaves of wood hinged together with leather thongs. The two inner surfaces were hollowed out to contain a layer of wax on which the writings could be scratched with a stylus. In the 5th cent. folded manuscript sheets of parchment or vellum were assembled and sewed together to form the forerunner of the modern book. Thin wooden panels were soon applied to protect the sheets and were fastened together with leather thongs, laced through holes bored in the back edge of the boards. A leather covering for the thongs was then introduced, which was finally extended to cover the whole area of the boards completing the essentials of modern bookbinding.

The application of decoration by blind tooling on leather bindings became common practice in the 6th cent., although other materials including gold, silver, and precious stones were used in binding and decorating the more expensive books. In the 15th cent. the art of gold tooling was introduced into Europe from the East and toward the end of the century, due to the advancement in papermaking technique, pasteboard began to replace the wooden board sides.

With the invention of movable type in the 15th cent., book publishing expanded rapidly and with it the art of binding flourished. The influence of the Renaissance binders, such as Jean Grolier with his interlacing of geometrical designs supplemented by floral motifs, is still imitated today by designers for the more ornate trade bindings.

The art of fine binding declined in the 19th cent. until T. S. Cobden-Sanderson, a disciple of William Morris, revived it in England. Partly due to the Cobden-Sanderson interest in the work of the outstanding Renaissance masters, binding today falls into three types: **fine binding,** usually done with hand tanned leathers decorated by blind or gold stamping by hand, **rebinding** or **repair binding,** and **trade binding,** produced by machinery with cheaper materials including cloth, cheap leather, and imitation leather, and decorated with plates which produce the design in one stamping operation. Leather and gold stamping alone, however, do not produce a fine binding, and in spite of cost limitations frequently trade binding, due to proper exercise of taste achieves a high degree of artistic success with less costly materials.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

The fine binder today is that rare combination of artist and craftsman. He must be an accomplished designer in his medium and have attained the highest degree of skill in the use of his materials. Working entirely by hand he is able to use not only the best practices of the past but take advantage of the more uniform materials of today. His book is hand sewn, usually to cords which are fastened to the boards, and every effort is exercised to produce a flexible back that opens easily, lies flat, closes easily, and remains closed yet is firm and durable. The edges of the pages are usually gilded except when deckle edge paper is used, and then only the top edge receives this treatment. Head bands to support the top and bottom of the spine are applied either to the backbone or to the spine itself. The boards are covered with one of the best grade, hand tanned leathers, usually calf, goat, or pigskin. These operations are known as **forwarding.**

The final step, called **finishing,** includes the decorating of the cover. A suitable design is developed by pencil on paper and duplicated in ink by small stamping tools which may be prepared especially to produce this particular design. These tools (usually one motif to a tool) are made by cutting the motif on the end of a brass rod and inserting it in a long wooden handle. The leather cover is moistened and the design is transferred lightly to the leather by individual impressions of the tools. The gold size is applied to the leather and the gold leaf is laid on and a final and heavier impression of the design is made with the tools, which are heated to cause the gold to adhere to the leather. Occasionally colored leathers are inlaid into the cover to help produce a more ornate result. The edges and inside margins of the cover are frequently stamped with delicate border designs. A fine binder will spend days, weeks, and even months designing and producing a single book, which obviously limits the market to wealthy collectors and patrons. Possibly due to a greater appreciation and encouragement for the production of fine editions of books, this type of binding has found more favor in Europe than in the U.S.A. —H E.S.

**EARLY CHRISTIAN ARCHITECTURE.** The small communities of the first two centuries held their meetings in any good-sized private room that was temporarily available (*Actus Apostol.* XX, 7-12). From the 3d cent. on they purchased houses in their own right and transformed them into permanent "community houses" (*domus ecclesiae, tituli, dominica*) containing a meeting hall for the Service, a baptistery, a **consignatorium** (for the confirmation), a vestry, rooms for board meetings and quarters for the clergy (Dura-Europos, "church" ca. 231 A.D.; Rome, building underneath SS. Giovanni e Paolo). The catacombs outside the city with their intricate galleries and small tomb chambers were never used for regular Services. Only occasionally were memorial Services held in chapels of trefoil, round or cross shape above or within these subterranean cemeteries (Rome, S. Sotere and *Capella graeca,* both Catacomb of Calixtus).

Independent church buildings may have first originated in the period of peace between 260 and 300: rectangular barn-like structures with or without interior supports, transversally divided for clergy and congregation and accompanied by baptisteries, *consignatoria* and rooms where the uninitiated *catechumen* could attend part of the Service (Rome, S. Crisogono I; Aquileia I, before 320). Their patterns are based on those of Roman public buildings such as the *curiae,* and possibly also on factory sheds. After the recognition of Christianity in 313 the early Christian **basilica** gradually evolved as the dominant church type. Its plan represents a variant of Roman secular *basilicae* (meaning "hall"), public meeting places near the town *fora,* consisting of a nave flanked or surrounded by lower aisles and of the more sacred *tribunal* where justice was administered under the image of the Emperor's divine majesty. Term and pattern are shared by "secular" and "ecclesiastical" basilicas with slight variations to accommodate the changed functions of the Christian buildings. Constantine's foundations (313-337) (Rome, Old St. Peter's, Church of the Lateran; Jerusalem, Holy Sepulchre; Bethlehem, Nativity) show the long nave, the four longitudinal aisles, all with open timber roofs, and the clerestory with numerous wide windows. Colonnades between nave and aisles carry an architrave or arches. In Jerusalem the aisles were surmounted by galleries as in some secular basilicas. This "congregational hall" was preceded by a colonnaded courtyard, the *forum*-like *atrium* (from Greek *aithrion,* not from *atrium* of Roman house), and terminated by a **memoria** over the venerated spot (St. Peter's tomb; Grotto of the Nativity) where the altar rose. This memoria is octagonal or circular in Palestine; in Rome it is a long "continuous" transept, transverse structure between the nave and the *tribunal-*

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

like semicircular apse. The simple meeting halls of the pre-Constantinian period are superseded by the splendid audience halls of the King of Heaven (best preserved example of Constantinian type: Rome, St. Paul's 385-ca. 450, though restored 1825-1930).

During the 4th and 5th cents., basilicas intended for the regular Services superseded these Constantinian types inside the cities: the nave with only two aisles is terminated, usually at the east end, by a simple semicircular vaulted apse with a priest bench (**synthronos**) along its wall and the bishop's **cathedra** at the apex. The altar, surmounted by a canopy (**ciborium**) stands in front of the apse at the end of the chancel which protrudes into the nave, surrounded by precious marble screens (**cancelli**) and flanked by two pulpits (**ambones**). The transept is very rare. Apse and nave are decorated with murals or mosaics, curtains hang between the precious columns; marble incrustations cover the lower parts of the brick walls, a reddish golden light flows through the opaque glass or mica panes of the wide windows (Rome, S. Maria Maggiore, S. Sabina both ca. 430). This Roman type differs from that of other regions: the small but extremely massive stone churches of Syria with two-tower facades and with sacristies (**pastophories**) flanking the apse, emphasize the rich formation of the exterior rather than the interior (Qalb-Luzeh, late 5th cent.); similar, though more crude, are the tiny barrel-vaulted churches of Anatolia, Binbirkilisse). Timber-roofed basilicas often with galleries above the aisles and with externally polygonal apses (Constantinople, St. John of the Studios, 463; Salonica, H. Paraskevi), sometimes with "tripartite" (Corinth, basilica, ca. 400; also Rome, S. Pietro in Vincoli, 420-50) or with three-aisled cross transepts (Menas city, basilica of Arcadius, 5th cent.), particularly emphasizing the wealth of interior decoration, prevail in the coastlands of the Eastern Mediterranean. The churches of North Africa and Spain are large sized with simple contrasts of horizontal and vertical planes, usually with three but sometimes with five, seven or nine aisles (Carthage, basilica Damous-el-Karita, ca. 400; Tipasa, Great basilica, ca. 400; Kh. Guidra first half 5th cent.; Tebessa, 5th cent. [?]), occasionally with vaulted aisles (Le Kef, Dar-el-Kous) and sometimes with double apses (Uppenna I, 4th cent; Vega del Mar). Along with these basilicas, octagonal and round domed baptisteries with deep founts (**piscina**) in their centers replace the plain annexed pre-Constantinian baptismal rooms (Ravenna, Baptistery of the Orthodoxs, ca. 450). Memorias are erected over tombs or other venerated spots. They are circular or octagonal, related to Roman **mausolea** (Rome, S. Costanza) with or without galleries over the surrounding ambulatory and frequently with wooden domes (Jerusalem, Rotunda of the H. Sepulchre) or with open roofs (Jerusalem, Church of the Ascension). Others are large cross shaped structures with four either single naved or three-aisled wings of equal length (Antioch-Kaoussié, ca. 380; Kalât Simân, ca 450) or quadrifoil buildings with ambulatories and galleries and wooden domes (Milan, S. Lorenzo, late 4th cent.; Antioch-Seleucia, Martyrion, 5th cent.; Bosra, cathedral 526). Vaulting seems limited to smaller *mausolea* and baptisteries (Ravenna, so-called Mausoleum of Galla Placidia, ca. 450).

These different *memoriae* types form the basis on which Byzantine architecture develops from the early 5th century on. It replaced early Christian architecture throughout the Mediterranean countries. Roman early Christian architecture is revived only within Carolingian architecture of the 9th cent. See Butler, *Early churches in Syria,* 1929; Crowfoot, *Early churches in Palestine,* 1940; Frothingham, *Monuments of Christian Rome,* 1925; Gsell, *Monuments antiques en Algérie,* 1901; Krautheimer, "Beginnings of Christian architecture", *Review of Religion,* 1939; Van Millingen, *Byzantine churches in Constantinople,* 1912. —R.K.

**EARLY CHRISTIAN ART.** It was the fortune of Christian art to originate and develop during a period (first five or six centuries of our era) when all of the arts, save architecture, were in a progressive decline, the causes being implicit in the times. The arts of Christian society accordingly shared in this regression, with occasional startling exceptions, until finally they emerged in Byzantine style and the arts of medieval Europe.

The earliest Christians had no interest in art, and naturally none in art theory. They were merely indifferent, with no particular feeling one way or another. Certainly, with the exception of sundry doctrinal puritans, they were not antagonistic. Surrounded as they were with the accumulated material of centuries they accepted it naturally and casually, until in the 4th cent. they began to apply the arts for impressive purposes, and especially for instruction.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

The interest in early Christian art centers, first, in the subject matter supplied by Christianity itself, affording general unity and responsiveness to contemporary successive and also to provincial emphasis; and second, in the struggle with the technique of existing styles in giving expression to this body of Christian truth.

The two main sequences from late Hellenistic art dominated the entire era, Eastern (Neo-Attic) and Western (Alexandrian) under Greek and Latin modes of thought, with strong impulse from the peoples of Western Asia. These styles were modified by reacting forces until the Alexandrian style ended in complete ruin, and the Eastern resolved into the abstractions of Byzantine art. It will be convenient to treat of the Alexandrian sequence first.

I. *Alexandrian sequence.* Christian art began with the popular substitution of Scriptural subject matter for pagan mythology in the visual arts. The earliest existing examples and the most significant are the fresco wall decorations in the catacombs of Rome painted during the first 400 years. (The dates are afforded by archeological criteria.) They constitute a direct attack on the so-called Alexandrian style, as practiced in Italy, from which they are derived and accordingly are of primary importance. The attack was on the matter of environment in space composition, the outstanding characteristic of Alexandrian illusionism. The modification was due to accident, to incompetence and to the reaction of Eastern styles.

The first cause for the modification was that of accident, arising from conditions of place and workmanship. The **catacombs** of Rome consist of a vast mileage of underground passageways and small rooms, excavated by Christians for the burial of the dead, and for no other purpose. Following contemporary practice in the decoration of tombs they began, even in the 1st cent., to adorn the wall and ceiling surfaces with fresco paintings and stucco patterns, as inclination and resources suggested. It all followed the mode of house decoration, amply illustrated at Pompeii. The areas were organized by line into panels of various geometric shapes, but not by architectural members, since none were required in the catacombs where the granular tufa was itself the structural member. Garlands and festoons of vines and flowers were painted liberally as accompanying adornments, together with birds and pastoral animals, making it clear that decoration was the primary intention.

The panels, as at Pompeii, invited subject painting and at once the Roman Christians turned to the Scripture, retaining a select few subjects from mythological sources, such as *puttos* and Orpheus with his beasts, but none of subjects which actively portray pagan episodes. (See H. Le Clercq, *Manuel d' Archéologie Chrétienne,* I, pp. 126-182). In so doing they were confronted with the double task of selection and composition.

The selection consisted of vital episodes from the Scripture stressing the saving intervention of Divine Providence in behalf of men and women of faith. From the Old Testament are featured Noah, Abraham, Moses, Jonah, Daniel, the Three Youths in the Furnace, and Susanna. The New Testament series is confined to the life of Christ in the Gospels; the nativity, baptism, the Good Shepherd, the Samaritan woman, miracles of healing such as the paralytic, the raising of Lazarus, and episodes interpreting the Eucharist such as the Multiplication of Loaves and Fishes and the Wine Miracle at Cana. The Passion history is entirely omitted, and in fact does not appear before the 5th cent. carvings. It is to be noted that all of these themes ignore death. They adorn tombs, but emphasize life which is regarded as a continuity. They stress faith, hope and the essence of Christian experience and are singularly cheerful.

The problem began in composition, and while at first there was some slight attempt to constitute the scene, as Nebuchadnezzar's palace as background in the theme of Daniel among the Lions (early 2nd cent., Greek Chapel in the catacomb of Priscilla. J. Wilpert, *Fractio Panis,* Pl. IX), this ambition was renounced almost from the start and a mode developed which is characteristic, though many times compromised with pictorial effort. It was based on the fact that everybody knew the stories and so there was no need to depict them, and proceeded as follows: (1) the theme was analysed, (2) the essential ingredients were isolated and all other data eliminated and (3) those data selected were then organized into a composition of great simplicity in traditional design. Mutual relation of figures was indicated and some suggestion of place, but real space (and above all distance) was ignored.

An extreme example is one of Abraham's sacrifice of Isaac in a sacrament chapel of the catacomb of Calixtus in the 2nd cent. It consists of Abraham with arms raised in

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

prayer, Isaac on one side and the substituted ram on the other, an altar balancing a bundle of faggots, and a tree without leaves suggests a rugged landscape scene. These elements are formally displayed and graduated in size with Abraham on the axis as if they might fill a low triangle such as the pediment of a temple. (Wilpert, *Pitture delle Catacmobe Romane,* pl. 41).

It must be added that while accessories of environment are eliminated the painter was as realistic and vigorous as possible with what was portrayed. Figures are solidly constructed, and indeed with emphasis. The net result of this stenographic brevity in constituting a theme, and its consequent non-pictorial character, was to concentrate on its meaning and to invite the observer to reflect upon it and to extend his spiritual experience as far as he might care to. This is *symbolism,* the dominant characteristic of Christian art of the first four centuries, almost unknown in the arts of paganism since they had little to symbolize.

The function of a symbol is to stimulate imagination and to set free ideas, and its force is enhanced by emphatic concentration on its essential nature with exclusion of all else. And this came about by the accident that these paintings were executed underground, by artificial light and hastily, by artisans of medium ability for the most part (we can imagine what their work in house decoration must have been like), and it should not be forgotten that their efforts were for patrons who did not see them every day, but only at intervals when they had occasion to visit the catacombs; and finally, that these humble efforts made no pretense of being works of art. Furthermore, they became worse as time went on and no attempts on the part of 4th cent. painters to add lively touches or to bring back environment did any good. Many are incredibly bad. The later technique is especially bad. But they do constitute a cycle and inform us quite well of the fortunes of the art of painting in the last years of the Empire in the Latin areas.

The elimination of environment was accidental at first, and then consciously maintained when its symbolic effectiveness was recognized, and this was a decided modification of Alexandrian style. The painters eliminated distance, perspective, light and shade, cast shadows, atmosphere, though they retained tri-dimensional rendering of data and plausible mutual relationships on a restricted plane. Construction was by color, rather than by line, and in a spotted sort of impressionism, with occasional instances of decided merit. The earliest are the best, esp. in the creative period of the 2nd cent.

Greek principles in design were maintained with tenacity as formulas, and prevailed over historical data. For example, in the Epiphany when the Madonna and Child are at the end of a rectangular composition there are always three Magi, but when she is on the axis she is flanked by one or two on either side, as required by formal balance.

Changes in emphasis in symbolic thinking may be traced in the 3rd cent., responding to the forebodings of that era. The sense of evil in a declining civilization caused Christians to reflect upon sin and its origin in human nature and to introduce the primary anthropological symbol of Adam and Eve. Job also made his appearance as an example of misery, albeit enlivened by the figure of his wife handing him a cake on the end of a stick. (In this connection it may be pointed out that never, from earliest examples such as Jonah and Daniel of the 2nd cent., did Christians show any hesitation in depicting the nude figure.) In the 4th cent. there is definitely general confusion. The catacomb cycle ends with the capture of Rome by Alaric in 410, though the tombs of the martyrs received decoration until the 9th cent., when the catacombs were forgotten amid the troubles of the times.

Because of their sketchy character and general incompetence catacomb frescoes are given serious attention only by specialists. They are largely ignored in general works on the history of art, and such writings frequently indulge in misinformation. The most authoritative work (C. R. Morey, *Early Christian Art,* 1942, pp. 77, 102), states that, like the contemporary paintings at Dura, the Roman catacomb paintings did not have sequence in later styles. This is understandable since Rome now entered upon a period of disorder and chaos lasting for centuries and had little occasion to indulge in symbolic thinking, especially since the Eastern style now introduced presented work of genuine ability. Catacomb painting, however, did isolate experience and emphasize its significance and thus in a measure made it abstract. Accordingly, in this cycle we find one of the sources of Byzantine style.

Other examples are located in the catacombs of Alexandria, Naples and Sicily, with local variations, but the later fortunes of

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

the Alexandrian manner in painting are revealed in the arts of mosaic and miniature.

Mosaic decorations in churches are a public art, and indicate the desire of the Church to apply the arts for its purposes. The change accordingly is from symbolism, which invites intimate personal exploration of ideas to a didactic program which is essentially public. Together with the decline of letters the Western Church in the 4th cent. was confronted with the problem of instructing the new converts in the Scripture narrative. The pictorial style of Alexandria was suitable for this, and the mosaic decorators attempted to transfer miniature illustrations of the sacred text, originating in Alexandria itself several centuries earlier, to the wall surfaces of churches in the medium of mosaic, continuing a practice of copying Hellenistic masterpieces. such as the Battle of Alexander mosaic at Naples.

The noted example is the series of mosaic pictures in the basilica of Santa Maria Maggiore at Rome of late 4th cent. and later. In these illustrations the struggle with illusionism, created originally by the brush, in the permanent medium of mosaic is very revealing in the essential nature of tridimensional atmospheric painting. A primary cubism is attained, as in the distinguished head of Simeon, literally created out of cubes, and impressive both structurally and in chiaroscuro. (Richter and Taylor, *The Golden Age of Classic Christian Art,* p. 37 in color).

Among other examples the 5th cent. mosaics of the tomb of Galla Placidia at Ravenna, esp. the lyric presentation of the Good Shepherd, may be cited.

Miniature painting is represented in the well known Joshua Roll of the Vatican, the pictures of which are dated in the 7th or 8th cent., but derive from illustrations created in the 2nd. Another famed example is the Vienna Genesis of 5th or 6th cent., the pictures having been copied from a roll illustrated centuries earlier at Alexandria or some eastern center. In these miniatures environment, including light and shade and cast shadows, is depicted with such skill as the artist could contrive, though with obvious strictures. The narrative purpose is emphasized fully, since the intention is to illustrate the episode and thereby edify the spectator. Through them the Alexandrian impressionism lingers on, strongly fortified in the 7th cent. in Santa Maria Antiqua in Rome by painters from Alexandria who fled from the Arab conquest of Egypt.

The Alexandrian manner is also continued in a languishing way in the sculptured relief decorations of some of the 4th cent. **sarcophagi.** These carvings constitute the last phase of the decline of Roman-Hellenistic sculpture. They are chiefly of the frieze type, some being in two ranges, and are quite lacking in decorative unity, though a few, such as those featuring the Jonah episode, continue an effect of overall pattern. The subject matter is mostly of the concise themes of the catacomb frescoes, with sundry additions, and continues the symbolic purpose in a rather mechanical manner. Content is the only interest since realization of form is at a minimum, and illusionism has vanished.

There is, however, genuine merit in ivory **carvings,** of such as stem from Alexandria, a metropolis for the export of ivory. There is considerable dispute regarding the source of consular diptychs, and they may be assigned to other style centers, but the masterly carving of the ivory of the Angel descending the stairs and of the superb chair of Maximian at Ravenna (6th cent.) continue the heritage of impressionism with distinction. The 5th cent. panels of the wooden doors of Santa Sabina at Rome likewise display traces of Alexandrian influence, intermingled with the technique contributed by the Eastern area.

II. *East Christian art* presents negligible existing examples before the 4th cent., earlier material having been destroyed during the centuries of violence which have plagued the lands of the Near East; or at best this material awaits discovery. Its sources are inferred from developments of late Hellenistic style, such as Neo-Attic sculpture, Asiatic sarcophagi and the mosaics uncovered at Antioch (together with the paintings at Dura), Persian and other styles of western Asia.

It is difficult to agree upon a single title to cover the entire field since it includes the output of scattered centers; Antioch, Jerusalem, Ephesus, Constantinople, Coptic Egypt, Cappadocia, Syria, and in the west, Ravenna, Milan, North Italy and Gaul and even Rome. East Christian is as good a title as any, though the term Greek-Asiatic has much to commend it because it signifies the meeting of Greek ideas with those of the peoples of western Asia. All of this implies a meeting, clash and reaction of the purposes of divergent racial stocks until a synthesis is attained in the 6th cent. and the first Byzantine style results. The varied expression of such a wide area is bewildering, affording considerable difference of opinion among specialists. The

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

confusion is all the greater since objects were transported everywhere and made impression on local styles with consequence of further mixture. This is especially true in Italy and Gaul where contact with the lingering Alexandrian manner led to adjustments and compromises. To the person unacquainted with the material it looks much alike, appears to be incompetent in workmanship, and essentially strange.

The confusion may be resolved somewhat when we reflect upon a few essentials: (1) the content is Christian, (2) the figure is in the continuation of the Hellenistic and therefore maintains a classic reminiscence, (3) the decorative element, including design, is oriental.

In an attempt to simplify the confusion the following general sketch of causes and characteristics is offered. The free imaginative symbolism of the rather simple-minded Christians of the West did not appeal greatly to their brothers in the Eastern area. Here Greek methods of thinking prevailed. The verities of Christian faith were subjected to a turmoil of reflective thinking: definitions, subtle distinctions, analyses, interpretations, coherent organizations, resulting in creeds and systematic theology by reference to which orthodoxy was established and heresy confuted, though heresy was strong enough to organize several national churches on the fringes of the Empire. Greek philosophy, worn out by its scholastic struggles, now entered upon an era of new vigor and usefulness as Christian theology. Its own lingering pagan refreshment as neo-Platonism and neo-Pythagoreanism was sterile.

The intellectual interpretation of Christianity, nothwithstanding the clash of passions, tended to be impersonal and to remove men from the objects of devotion; a sort of optic point of view mentally, entirely consistent with the contemporary rule of this practice in the arts.

In curious harmony with the above was the impact of the traditional thought processes of the oriental ingredient, emerging from ancient Mesopotamia and desert lands, which had powerful effect. It was essentially non-intellectual in the grand manner, eschewing definitions and analyses, and relied rather upon contemplation without interpretation, and did so with awe and wonder; hence the oriental mysticism which dazzles the western mind. Bits of experience are thoroughly described but without investigation of causes. They are indeed in continuity, but without the flow of cause and effect in a linear sequence; the whole affording a pattern which may be as intricate as an oriental rug. The observer again is removed from the object but is amply rewarded by the rich color and rhythmic pattern unfolded before him. Such pattern is non-representational in its treatment of phenomena, and imposes the question of environment. On this East Christian art held definite views and made a contribution of utmost importance, constituting a strain of unity in the style.

The Greek and oriental processes converged in Christianity upon experience which certainly cannot be described but only inferred and contemplated; viz., that of the heavenly world. The divine majesty and glory, the felicity of the saints and martyrs and the entire heavenly host suggest an environment remote from earthly experience, but capable of intimation by art relying upon word-paintings in the Apocalyptic visions. The fruition of this is in Byzantine art, but the beginnings are in this period. This scene is properly two-dimensional, as befits vision, and invites rich display of color. With this the saintly experience in this world is in harmony. It is special, set-apart and precious, so far removed from the ordinary that it scarcely serves as an example to people in daily life, though men may contemplate it.

The academic phase of Hellenistic scripture had given concentrated attention to the single figure in the manner of the masters. Presently such important figures were further isolated on sarcophagi of western Asia by architectural framing (columnar and arcaded), and maintained on one plane. That is, they were non-pictorial, and the environment was limited by architecture, and with no depth.

This is the optic point of view, according to which the spectator realizes material by the eye, rather than by suggestion of touch, and therefore from a distance favorable for observation. He is manifestly apart from the objects portrayed which are physically and mentally isolated. It is an oriental process of constituting phenomena which made contact with Hellenistic art in the style known as Neo-Attic. Here the oriental mind made its primary contribution (Persia, Mesopotamia). It was that of color as the equivalent of environment and as a symbol of its quality. The technique in sculpture known as **colorism**, undercutting and perforations with the drill to a common depth, applied to architectural members afforded an effect of vibrating colored air when viewed from a distance. (The at-

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

mospheric enrichment of colorism is quite different from the chiaroscuro of Alexandrian illusionism which affects the realism of actual experience.) In coloristic technique embellishing details were sharpened, made intricate and flattened so that they suggested the pattern of textiles.

The tendency then, was towards one colorful plane, of no determined depth, in which well-rounded figures were placed. The effect was non-naturalistic, and a generalized formal experience was suggested; an experience to be observed but not one in which the observer might participate. It was in the nature of spectacle, and reflected the desire of men to reflect upon aspects of Christian truth. (Cf. *Christ and Two Apostles,* fragment of the 4th cent. sarcophagus in Berlin. This is the style of the best sarcophagi of the 4th cent., as was promptly recognized by people of taste at Rome and other western centers. Such objects are infinitely superior to the examples of the local Latin manner then being carved.)

The method was increasingly linear (q.v.), and primitive conventions returned: broad aspect of figure, frontality together with disjunctive and awkward pose. The projection was often inverted; another oriental contribution. Distortions are occasioned, however, by uncertainty as well as by incompetence, until finally the style appears to have made up its mind and created the Byzantine synthesis.

These processes are illustrated in small objects of descriptive content, ivories( consular diptychs, panels, boxes, covers, etc.), oil bottles and cases for relics carried home by pilgrims returning from Palestine, accessories of one sort or another. Description, while complete, is at times disjunctive in organization, with the several data treated in intense isolation and without logical sequence, each part being portrayed separately, but contributing to the pattern of the whole. The descriptive content varies in geographical areas, and the details of iconography invite endless archeological investigation, in such matters as the presentment of the person of Christ, the introduction of the angel to lead the magi in the Epiphany (Coptic), the standing Mary in the Annunciation (Syrian), the architecture of the Holy Sepulchre (Palestine and Gaul gave authentic record), the author Evangelists seated as philosophers (Ephesus), and so on.

The colorism in marble was fortified in painting by frank acceptance of oriental usage, the examples being chiefly in mosaics (Ravenna Baptesteries, e.g.) and a few miniatures (*Rossano Gospels, Gospel Book of Rabula*). Anticipated by the 1st cent. cult paintings of Dura, opulent figures appear in colors restrained by contours against a ground of one tone, such as purple and finally gold, —the obvious atmosphere of heaven. Presently the figures became flat, with slight suggestion of modeling and consequent loss of form and organic relation of costume to figure. Finally, all that we have is colorful costume, equipped with head, hands and feet. Such figures are represented in an unrealistic setting which is non-spatial, since it has no depth, or which is vertical in projection.

The use of the figure is implicit in both Greek and Christian art, but not in oriental. The oriental contribution then, consists in providing a significant, non-realistic environment, which it does largely by means of color, and also by its rhythmic decorative principle. Unity in composition is achieved by rhythm in the best examples. Greek principles, such as axis and balance continue, however, as in the sarcophagi of Ravenna. The period of 4th to 6th cents. presents only the beginning of such organization, and is of considerable importance in the struggle with style. It is marked by incompetence in the attempt to use the inheritance of age-old technique, Hellenistic and oriental, and by the refreshing experiments in original creation. It was progressive, not decadent as was the fearful decline of illusionism in the West, and accordingly was patronized by influential persons everywhere, Western as well as Eastern. Notable examples exist at Ravenna and Rome. Coptic Egypt presents it in such a summary fashion that it is well nigh an epitome and is highly regarded by modern critics. In any case, the unreal environment created was precisely required for the abstract concepts in which the Greek church delighted.

(There can be no discussion of East Christian art without reference to the insistent oriental theories of the Austrian scholar, J. Strzygowski. The prolific writings of this expert have now been assessed and there is general agreement on the essential merit of his contribution, viz., the forceful presentation of the oriental ingredient of nonrepresentational art with characteristic decorative principles.) **early classical style.** See HELLENIC ART.

**early romanesque art.** See GERMAN ART.

**ear-mark notation.** See JEWISH MUSIC.

**earth color.** Any colored mineral used as a pigment.

**earthenware.** Term for porous body, white ware with lead glaze. See CERAMICS I.

**earth reds.** See iron pigments.

**earth yellows.** See iron pigments.

**easel.** Any frame built to hold a painting, ordinarily during the time when it is being made, can be called an easel. The most frequently seen type in the representations of painters' studios during the late Renaissance in Europe is a three-legged piece of furniture on which the painting is held by the two forward legs, with the third standing out as a brace. More complex designs have been developed, particularly the studio easel with screw adjustments both for height and for the angle of the painting. Sketching easels made to fold up into a compact bundle are manufactured for landscape painters, and various types of small easels and table easels are available. The history of this piece of studio furniture goes back into remote antiquity, having been shown in a tomb relief of the Old Kingdom in Egypt. Mention is made of it in connection with legendary records about the Greek artist, Apelles, and many types are found in studio scenes from the Middle Ages on. —G.L.S.

**east Christian art.** See EARLY CHRISTIAN ART.

**eastern carpet.** See carpet structures.

**eastern chants.** The investigation of Eastern Church music is still in its initial stages. There is no great body of eastern chant (Armenian, Byzantine, Coptic, Ethiopian, Russian and Syrian) which remotely compares with the vast collection of Gregorian Chant. Although some pioneer work has been done in the various eastern chants, the Byzantine chant has received, and appropriately so, of late the most attention. To the student of music history the most vital question is the interrelationship and reciprocal influences of the chants of the east and those of the west—a question which for the most part remains unanswered.

It was not until the 12th cent. that the so-called **hagiopolitan** or **round** notation indicating precise intervals was invented. MSS. dating from the 8th and 9th cent. in the Ecphonetic notation based on grammatical accents are undecipherable. Neverthless, it is possible that some of the extant Byzantine chants belong to the period of Romanos (fl. 491-518) and Sergios (fl. 610-41), the Golden age of Byzantine Hymnody. The hymns (**kontakia**) of this period were written by men who were both poets and musicians. The later hymnologists, among them St. Andrew of Crete (d. 730) and St. John of Damascus (d. 754), set the hymns (**kanon**) to pre-existing melodies. The Ecphonetic MSS. although undecipherable give in some instances chants with melodic contours similar to those of later MSS. in the round notation.

It is generally agreed that the rhythm of Byzantine chant was free, the melodies following the stress accents of the words. The system of 8 **echoi,** said to have been perfected by St. John of Damascus, who gave Byzantine musical theory a definite form, bears a superficial resemblance to the 8 modes of the west (See modes, ecclesiastical), but the cadential formulas are different. The 4 **authentic echoi** in ascending order on a, b, c, d. The 4 **plagal echoi** lie a 5th below. The classification of authentic and plagal is theoretical. The initial or final note of a melody is not always the regular final of the **echos,** but is determined by a special form of signature.

The system of modern or **Chrysanthine notation** codified by Chrysanthus, an Archimandrite, in the early 19th cent. and used in the Greek Church today should not be confused with the medieval Byzantine system.

The publication of the *Monumenta Musicae Byzantinae* comprising facsimiles, transcriptions, and critical studies of music of the ancient Byzantine Church is in progress under the editorship of C. Hoeg, H.J.W. Tillyard and E. Wellesz, the foremost authorities in the field.

See Chap. 3 in G. Reese, *Music in the Middle Ages,* 1940 and article on *Eastern Church Music,* in Grove's *Dictionary of Music and Musicians,* Sup. Vol. 1940. —V.A.

**Eastern North American aboriginal art.** Geographically the Eastern North American area includes that part of the continent from the Great Plains to the Atlantic and Gulf coasts. Unlike the situation in the Southwest, no coherent pattern showing interrelationships of cultures has been worked out for this area. The total picture is complex and confusing despite the large amount of excavation and the abundance of artifacts with rich aesthetic content. Names have been applied to important cultures, but they lack precise definition and no chronology has been established except tentatively in some locations.

This is a great woodland area whose earliest inhabitants were hunters and fisherman who fashioned polished stone tools with technical virtuosity and with a fine feeling for form. The introduction of corn precluded a more sedentary life which would make possible the introduction of pottery. From this basis centers of high culture gradually evolved, notably in the Ohio and Mississippi drainage and in the Southeast. Centering in Ohio were the Hopewell culture (q.v.) and the neighboring Adena (q.v.). Their most spectacular manifestations are the great mounds and earthworks (see Mound Builders) and their contents. The mounds, ranging from 4 to 70 ft. in height and enclosed with earth walls, are of several classes: the **conical mounds** for burial, in which numerous notable works of art have been found; the **platform mounds**, which were foundations for temples or domiciles, more frequent in the south; and low **effigy mounds**, made in the shape of a snake, bird or animal, such as the Great Serpent Mound (q.v.), and restricted to the northern Mississippi and Ohio valleys. Probably all the mounds had also some social or religious function. The earthworks, which are low enclosing embankments found chiefly in the Ohio basin, appear to have had a defensive, sacred, or social function.

Distinguished works of art, found chiefly in the burial mounds and apparently ceremonial rather than for daily use, comprise a large number of miniature **stone pipes**, copper and mica ornaments, intricately woven textiles, necklaces and ornaments of fresh-water pearls. The stone pipes were carved with flint tools; they represent bird, animal and human figures depicted naturalistically and with great vitality. Copper, obtained from the Lake Superior deposits, was hammered into thin sheets and by cutting, engraving or repoussé fashioned into headdresses, standards, bracelets, buttons, and various ornaments. The designs consisted of geometric motifs, which were handled with rare ability; human, bird and animal figures highly conventionalized; and dances in elaborate costumes, very much like similar figures found in the art of Middle America. Ornaments of varied designs were cut from thin sheets of mica obtained from Virginia and North Carolina—evidence of the wide trading of the Hopewell peoples.

In the Mississippi Valley arose another culture, sometimes called Middle Mississippi, centering between the Arkansas and Missouri Rivers and extending north, south and east. Lower Mississippi is a term sometimes applied to the southern reaches, but both terms are controversial. In this area the mounds, which are largely of the platform type, probably by influence from Middle America, served as bases for temples or chieftains' dwellings. Stone pipes again are characteristic but are large in size and, like the stone bowls with effigy attachments, represent animal, bird and human figures in a style that tends to a conventionalization required by ritual and stresses mass inherent in sculptural form. Yet surprisingly naturalistic figures have been found in clay effigy vessels discovered at Spiro Mound in Oklahoma and at Moundville, Alabama. Shell gorgets found widely in the southeastern area and engraved or cut into openwork patterns offer, both in their figures and their designs, additional evidence of contact with Middle America. The obvious influence of Middle American art in the southeastern area is a puzzling problem, for no actual Middle American artifacts have been found within the area. Pottery was abundant and various in style. Outstanding are the black bottles of the Caddoan tribe, which show spiralling designs incised either before or after firing. Frequently the incised lines were filled with color, or a polychrome decoration was obtained by the use of the lost-color technique. Though wood probably was used widely, only a few objects have survived.

A rare find of painted wood artifacts was made at Key Marco, Florida, where were discovered, miraculously preserved in muck, a large number of spear-throwers, human, bird and alligator figures, and ceremonial objects of all kinds, particularly the ceremonial masks in human and animal form which in their lively naturalism reach a high point of woodcarving among the native American peoples.

What became of these aboriginal cultures is uncertain. Some of them had disappeared or were decadent at the time of the coming

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

of the Europeans; others can be traced to the ancestors of the historic Indians in this area. See F. H. **echo.** See ACOUSTICS.

**échoppe.** A needle used by the earliest etchers, the point of which is cut at a bevel, enabling them to make a line that swells and tapers, imitating the engraving process. —K.K.

**echos, echoi.** See eastern chants.

**eclecticism.** The word comes from the Greek *eklegein,* which means to pick out, to choose, to gather. It is applied to the manner of those artists who compose their works by using the peculiarities of style of different artists or epochs without possessing the ability to concentrate these divers peculiarities in an organic unity. Working in a single style of a certain epoch, like in the Greek, Romanesque, Gothic, etc. style, may be called eclecticism also. The term stands in opposition to that artistic expression which arises within the nature of the artist himself and which results in a work of proper and organic quality.

Usually eclecticism comes into notice at the beginning and end of a whole era as well as singular epochs. Young peoples meeting old cultures superior to their own are pressed by this superiority to work in an eclectic manner until they have succeeded in digesting these influences and developing their own proper style upon a higher level. Corresponding to this primitive eclecticism is the rational eclecticism at the end of a cultural development. The latter is caused by decreasing artistic substance and an increasingly critical and reflective view of the world We notice primitive eclecticism, e.g., among the works of early Egyptian, early Greek, or early mediaeval art. Typical rational eclecticism may be noticed at the end of the Renaissance in the middle of the 16th cent. Eclecticism laid the foundation of the first European academy of art founded by the brothers Caracci. This academy originated from the opposition to Michel Angelo's late works which showed baroque tendencies. Many artists decided not to follow these baroque tendencies but to cling to that which the outstanding Renaissance artists had achieved. They tried to combine the charm of Raphael, the grandeur of Michel Angelo, and the light of Corregio. The result of this eclecticism was a set style. In the same way the classicism of the 18th cent. and its various renewals during the 19th and 20th cents. show eclectic tendencies. Together with the increasing discoveries of remote epochs of art and the critical and reflective view of art in recent times eclecticism has increased too. Sometimes, eclecticism becomes mannerism, as when the adopted elements of a foreign style are overstressed and applied in the way of formalism. —A.J.S.

**Ecole des beaux-arts** (Fr.). A well-known endowed school of the fine arts in Paris, founded in 1648.

**ecorché** (Fr.). Anatomical manikin or figure showing the muscles.

**écossaise.** A spirited dance of Scotch origin in 2/4 time which was originally accompanied by the bagpipes.

**ecphonetic notation.** See eastern chants.

**ectype.** A copy of an artist's original.

**edition.** See PRINTS AND PRINT PROCESSES.

**edition binding.** A trade binding design produced in quantity is usually called *edition binding* to distinguish it from the less common *fine binding* which often consists of a special design for a single volume. The production of quantity (often with quality) binding relies to a large extent upon machinery that does more rapidly and cheaply the various operations of hand binding.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

The first step in edition binding after the printed sheets are folded into signatures or sections is to **gather** or collect the book together in the order of binding. In most cases this operation can be accomplished by a belt that travels past hoppers which contain a quantity of the proper signatures and at the proper intervals drop a signature on the growing pile. At the end of the belt an operator occasionally checks or **collates** the order of placement to prevent misplaced signatures. In spite of this careful check books are bound and sold with either misplaced or even missing pages.

After gathering, or sometimes after sewing, an **end sheet** or folded piece of strong paper is pasted to the top and bottom signature. There are several types of book sewing machines. The most common method is to sew each signature and then connect it to the adjoining one with a loop of thread. For large catalogues and other books requiring unusual strength, machines are available that sew the signatures to tapes in a manner somewhat similar to hand sewing to tapes After sewing, a thin coating of flexible glue is applied to the back of the book and allowed to dry. The book is then **rounded** and **backed** or **smashed.** These operations form the back and give a concave curve to the foredge. Thin books are usually flat backed or **unrounded,** and instead of the almost unsupported cloth back of the rounded book, the flat backed type uses a flat stiff cardboard strip in the back of the case. After backing, the book receives another coating of glue plus a strip of thin cloth that extends over the sides onto the end sheet. This cloth hinge and the end sheet, when pasted to the case, will be all that holds the book and the case together. A piece of paper the width of the backbone is frequently applied on top of the cloth.

Most trade books are stained on at least the top edge or on all three edges and a few books are gilded. Finally, head bands are applied to the top and bottom of the backbone on the better editions. The book is now ready to be **cased.**

The making of the case and the **casing in** operation follow hand binding practices except that almost all operations are mechanical. The design is applied either by hot stamping with foil, real or imitation gold, aluminum, etc., or printed, blind stamped, embossed, or, in some cases, printed on the binding materials before the case is made. After casing in the finished book is placed by hand between brass-bound boards for drying and is ready for wrapping. —H.E.S.

**editor, exhibitor.** See circus.

**educational dance** is a process, not an end in itself. Fundamentally, educational and art dance are the same. The dance of the professional artist is but a continuation of this basic educational dance—his art maturing as he the individual matures.

The concern of educational dance is the development of expression through the study of dance and not with the development of professional dancers. Its aim is the integration of personality by means of participation in dance as a creative art experience—affording students the opportunity to know dance as a special way of experiencing aesthetic values discovered in reality (see creative dance). Its approach is the study of dance as a whole and the use of creative motor experience as the basis of instruction, instead of centering dance interest in professional performance. Since art demands the unity of all aspects of our complex nature—emotional, intellectual, spiritual, and physical—dance, as a creative art experience, is especially adapted to educational ideals. In art the drives are emotional. When they are subjected to the restraint and directions of the intellect and executed by the physical, there results a fusion of all our energies with the focal point centered in the personality. For dance to realize these educational possibilities it must be emotional, intellectual, and spiritual, as well as physical. Its instruction necessitates a background of study in the fields of science, philosophy, and art and their related fields. Although such an approach to the study of dance does not insist on professional perfection, it does, nevertheless, insist on high standards, thus building for the development of an artistic foundation upon which the talented may build a superstructure according to his capacities to ascend.

Educational dance should be the basic foundation for dance as an art. It is the beginning of art understanding with movement as the expressive medium. —M.N.H'D.

**educational drama.** See RADIO DRAMA.

**educational exhibition.** See exhibition.

**Edwardian.** See GREAT BRITAIN, ARCHITECTURE OF.

**effacé** (F. *effacer,* to shade or diminish in plane). A term in classic ballet vocabulary

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

generally applied to head and shoulders when they are set at certain angles to suggest greater plasticity, or to emphasize mass in space. —L.K.

**effigy.** Sculptured likeness, as on sepulchral monument.

**egg-and-dart ornament.** This design, used chiefly as a moulding in Greek and Roman buildings and their adaptations in Renaissance and modern times, originated probably in a leaf pattern, the "egg" sometimes showing a central spine and the "dart" derived from a lancelot leaf. No moulding has been more universally popular to indicate the division of architectural elements and to effect the transition from one to another gracefully, e.g., between wall and ceiling, between courses, and in ceiling coffers. Its vigorously conceived and sharply cut curved projections suggest the functional relationships of the building and enrich the surface. The most refined form of this motif appears on the Erechtheum in Athens. —W.R.A.

**egg-shell porcelain.** Porcelain so thin that it is often referred to as egg-shell porcelain.

**egg tempera.** In the regular panel painting of Europe before oil came into general use, the medium was yolk of an egg. The pigments were ground in water and to them was added enough of the yolk to serve as a binding medium. White of egg or glair mixed with various ingredients, principally water-soluble gums, or used without such additions, may have been a frequent vehicle of panel paintings and was the common tempera for manuscript illumination. Glair contains the adhesive substance, albumen. The egg yolk is an oily emulsion in which there is some albumen also. Being oily, it is relatively impervious to water when it is thoroughly dry, and the survival of large numbers of panel paintings from the late Middle Ages in Europe gives testimony of its favorable qualities as a painting medium. —G.L.S.

**e-gorai ware** (Jap.). Korean pottery of the *Korai* dynasty with surface under the glaze painted with floral motives. —J.A.M.

**EGYPTIAN ART.** Generally this term is understood to define the arts of ancient Egypt from prehistoric times until the conquest by Augustus in 32 B.C. It is sometimes limited to Dynastic Egypt, which is brought to a close with the conquest of Alexander in 332 B.C., and sometimes extended to include the art of the Roman period together with its later manifestations under the Copts (Egyptian Christians) until the Moslem conquest in the 7th century A.D.

Ancient Egypt proper included the entire Nile Valley and Delta from the Mediterranean Sea on the north to the First Cataract on the south, though this southern boundary during the new Empire was extended far into Upper Nubia and even to the Sudan; while Lower Nubia, the region immediately south of the First Cataract, was usually considered a part of the kingdom, being populated almost exclusively by pure Egyptians from the earliest times. Furthermore, Egypt generally claimed the deserts on the east to the shores of the Red Sea, including the Sinaï peninsula and the land directly north to the shores of the Mediterranean; and to the west the adjacent portions of the Libyan desert with their oases, including the fertile Fayoum district.

The ancient art of this region perhaps more than any other has a peculiarly unique character, which is established by a remarkable consistency of style. This was noted by Plato and has been reaffirmed ever since; yet Egyptian art did change, was acted upon by outside influences, though never to the extent nor with the rapidity that marks later Western styles, so that these changes are far less easily discernible. Moreover, none was strong enough to break the major conventions of this style, which had reached formalistic stability and mechanical precision at an extremely early date.

No survey of Egyptian art, however cursory, can be made without a brief review of the unique land, its government, and its religion, which controlled the nature of the arts even more completely than did Christianity during the Middle Ages in Europe, and for a greater period of time. Only slightly less important is some consideration of this time element involved.

The native name of Egypt was *Kemi* or *Kemet,* meaning "the black land," from the darkness of the alluvial soil of the Nile Valley. The modern name, Egypt, is derived from the Greek *Aigyptos* (origin obscure), which occurs in the *Odyssey* of Homer, where it is used as the name of the Nile River as well as the country, and with good reason, for the story of Egypt is the story of the Nile River (Egypt. *Hapi* or *Hapis*), which, in cutting its way northward through the eastern Sahara desert, makes fertile the narrow strips of land on either bank. The Nile valley, never more than ten miles wide and at many places less

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

than two, is below the general level of the desert and is bounded on either side by cliffs and hills rising in some cases as high as 1800 feet above the valley floor. These cliffs and hills, composed largely of limestone and granite, are sources of a plentiful supply of durable building stone. About 100 miles south of the Mediterranean the bounding hills spread to the northwest and northeast, and between them lies the Delta, which, except for the section immediately adjacent to the sea, is the most fertile region of Egypt. The Delta, about 150 miles wide at its base, is a broad alluvial plain which rises so gently from sea level that its southern extremity has an altitude of scarcely 30 feet. Except for this coastal section Egypt lies in an almost rainless area. What rain does fall comes in occasional storms, generally in the winter months, but so infrequently that no regular rainy season can be plotted. The Nile therefore becomes the sole dependable water supply as well as the means of soil revitalization by its annual inundation. Moreover, it is the one great artery of commerce within the empire. It is not surprising then that the Nile was one of the deities in the Egyptian pantheon, but there is no evidence that it ever was accorded the veneration given by the Brahman to the Ganges, nor does the regularity of its yearly rise and fall, together with the continuous procession of cloudless days and the isolation, both actual and felt, of the valley seem to have exerted on the Egyptian and his art the profound environmental influence claimed by so many writers.

However, the fact that the ancient Egyptian found himself in an environment which emphasized the ephemeral nature of living things and in which only the gods and the dead were one with an unchanging nature accounts for his loathing of the idea of death, his attempt to identify himself with this changelessness by persuading himself that he did not die but continued to live, in some strange manner sustained by the preservation of his body, surrounded by models and painted representations of his ordinary life on earth. The tomb then was to deny rather than affirm the existence of death. The arid climate, which preserved rather than destroyed, heightened his belief, but it is well to bear in mind that this holds true for the Nile Valley only and not for the moist sea coast or the well-watered Delta, which destroyed as completely as the Valley preserved.

Ancient Egypt was divided into two regions, Lower Egypt, consisting of the Delta with its adjacent lands reaching south slightly beyond Memphis, and Upper Egypt, which was the remainder of the Nile Valley. These two regions represented the kingdoms which existed independently before Menes, the legendary founder of the 1st Dynasty, united them under one rule. From the time of the earliest dynasties, however, Upper Egypt took precedence over Lower Egypt in matters of government and religion. Beliefs that developed in the former would find acceptance in the latter. During Roman times Lower and Upper Egypt were separated by a third division called Middle Egypt, extending from the apex of the Delta southward approximately to the town of Asyut (modern Assiut).

The government of Egypt was monarchical. The king was the head of a hierarchy of princes and great landowners, who administered the affairs of a series of districts called *nomes*. At various times almost feudal conditions prevailed. Local rulers set up establishments which rivaled the royal court and were kept in order only by the use of severe measures on the part of the monarch. During the New Empire the king had all powers centralized in him but administered the land by means of an extensive bureaucracy headed by a vizier responsible only to the king. Sometimes two viziers, one for Upper and one for Lower Egypt, were employed, but in this case the vizier for Upper Egypt had precedence. The king or Pharaoh (Heb., from Egypt. *Per'o,* the old term for "royal palace" or "great house," which became the personal title of the monarch in popular language) was considered divine, one of his titles being "the Good God," and was the mediator between the gods and men. This divinity led the country to be unduly dominated by the priesthood, whose power increased as the power of the Pharaoh increased. Eventually a reigning Pharaoh was supplanted by the priests of Amon, who founded a dynasty of their own.

The priesthood, largely hereditary though not necessarily so, administered a state religion which was a collection of the ancient tribal cults, beliefs, and concepts, combined into some semblance of a whole, and as such imposed upon the people. By the time of the earliest dynasties it had secured the stereotyped form which characterized it as long at it endured. It included a vast pantheon of gods, some of them local, some of them general or cosmic deities, but the beliefs and rituals are so confused and self-contradictory that any clear explanation of them is impossible. Interpretations are as many and varied as there are writers

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

interested in the subject, but it is clear that the Egyptian religion developed no spiritual concept or philosophy comparable to those developed in Asia. This pantheism was seriously challenged only once, under the reign of Amenhotep IV (Akh-en-aten or Ikhnaton), who introduced a religion of purest monotheism, the diety being the personification of the sun's disk under the name of Aten. The new religion scarcely survived the death of Akh-en-aten, and less than sixty years after its inception it had disappeared as completely as if it had never existed. Except for this unique circumstance, and possibly the late period under the Saites, according to H. R. Hall, the Egyptian's mental condition in religious matters was little above that of the Negroes of the Gold Coast.

Out of this mumbo-jumbo which passed as his religions the one clear fact emerged that the Egyptian resented death as he resented change. Perhaps here we can see the environmental influence of land and river. All evidence tells us that he enjoyed life and that he wished to project this enjoyable existence beyond his death. In order to do this all phases of his mortal life must be preserved in some manner: first his body in order that his soul might live—if not his body then a reasonable facsimile; next the persons and things that served him in life; and finally the actual scenes of his home, occupations, and diversions. All these guaranteed the perpetuity of this posthumous existence so long as they were preserved. Consequently all of these things must be embodied in the most durable materials in forms least likely to perish. During life the Egyptian was content with objects and materials of a relatively temporary nature. Even the Pharaohs lived in houses with walls of sun-dried brick and pressed mud roofs supported by wooden columns. Commercial buildings also were built for one generation to be replaced by the next. If metal was employed, it was for its ductility, color, and utility rather than for permanence. However, for the houses of the unchanging gods or the dead the most durable materials were sought and put into forms which had or suggested the greatest stability.

The art forms thus created were not marked by a disinterested search for beauty but rather by their utility. As the facts and objects represented were supposed to have the power of insuring existence after death, their immediate recognition rather than their aesthetic quality was of the greatest importance. In consequence, attention was paid only to those aspects of the object which most distinguish it from its surroundings and afford the clearest comprehension of it.

This purely conceptual idea of the visible world, which developed from as well as satisfied the necessities imposed by religion, habit, and economy, produced an art of pure illustration, which from the earliest time reduced all forms to a series of easily recognizable symbols and conventions executed in almost faultless craftsmanship. That Egyptian art was mainly literature in another form may be seen in the fact that neither sculptural relief nor painting ever lost the character of picture-writing completely; on the other hand, the Egyptian never abandoned the hieroglyphic for the alphabetic script, refusing to give up all reference to visual aspects even in his writing. Such an art of illustration and literary reference is necessarily an art of realism, but with Egypt this realism is descriptive and superficial, and, except in rare but noteworthy instances, is subservient to mannerism and style. Portraiture, which, because of the belief regarding life after death, was greatly developed, sacrificed vital realism to convention, advanced by the desire for forms of greatest durability. The close-knit, compact figures in the round present masses least likely to be damaged, just as the characteristic sunk-relief (see relief) protects surfaces from casual damage and affords as well the greatest legibility. Both of these types of sculpture undoubtedly owe part of their character to economy, being far less expensive in both time and money.

Furthermore, Egyptian art is noted for its anonymity. Few artists or craftsmen are known, though when known seem to have been individuals of exceptional ability. This anonymity must have been intended as inscriptions abound in names of kings, priests, and viziers.

All of the above factors combine to produce the singular uniformity of character to be found in Egyptian art.

Historical records, while plentiful, are fragmentary and present no strict chronology. Moreover, in spite of the great quantity of monuments, the information derived generally deals with works and expeditions of certain kings and gives little clue to the main lines of history. The most complete knowledge of Egyptian civilization is to be obtained from the biographical inscriptions and countless local scenes which are depicted on the walls of tombs and temples. Early in the 3rd cent. B.C. Manetho, an Egyptian priest, classified the kings of Egypt into a series of dynasties.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

His work, preserved by early Christian historians, is full of errors and defects but still provides the accepted scheme of classification. These dynasties have been grouped into longer periods, usually named for the city or province which was the leading center of the time. These groups of classification vary in name and detail, depending upon the opinion and methods adopted by the particular authority, but mainly agree on the principal periods. No such agreement is seen when more precise dating is attempted. The records, methods, and theories by which widely varying dates have been advanced are too complex to be discussed here; it is sufficient to mention that the various dates set for the beginning of the 1st Dynasty vary as much as 2200 years. The following list of dynastic groups with approximate dates in round figures, representing a composite of the greater part of contemporary opinion, should serve for practical purposes. Where opinion approaches unanimity regarding the commencement of a particular dynasty, it is mentioned specially.

Pre-dynastic Period until 3200 B.C. Ancient Empire or Kingdom (Thinite and Memphite), Dynasties 1 to 10, 3200-2200. Middle Empire or Kingdom (Theban), Dynasties 11 to 14, 2200-1800; 12th Dynasty, 2000. Invasion of Shepherd Kings (Hyksos), Dynasties 15 and 16, 1800-1600. NewEmpire (Theban), Dynasties 17 to 20, 1600-1000; 18th Dynasty, 1580. Delta Dynasties (Saite), Dynasties 21 to 30, 1000-332; divided into two unequal periods by the Persian conquest of 525: 1st period, 21st to 26th Dynasties; 2d period, 27th to 30th Dynasties. (Many authorities introduce a 31st Dynasty representing the Persian occupation just preceding the conquest of Alexander.) Ptolemaic Period or Dynasty, 332-30.

Egyptian art then extends over a period whose length, by the most conservative estimate, is nearly two-thirds of man's recorded history. This fact alone gives increased importance to its various phases.

PRE-DYNASTIC PERIOD: With the usual early records of pottery and flint weapons we find a funerary art of painted pottery figures of women, either standing or seated, with arms raised in an attitude of mourning or supplication. The figures show little realistic representation, and their painted decoration seems to simulate tattooing. Ivory tusks with tips carved into heads of men with long beard are found. Combs and other useful articles carved with figures of animals come slightly later. Later pottery shows pictures of men and women (more prevalent) and animals done in solid colors. The typical Egyptian blue glaze "faience" had also been invented.

The people who were to form the "Dynastic Egyptians" seem to have moved up the Nile from the north, and as their conquest progressed the level of the art was raised. Stone vase-making improved, and gold appeared as ornament. Stone sculpture appeared in rather rude flat relief on limestone grave monuments. Slate palettes, both painted and carved, developed in size. The carvings are characterized by processions of domestic animals usually arranged in horizontal rows, affording a strange parallel with the early art of the Mesopotamian Valley.

OLD EMPIRE: At the beginning of the Dynastic period there was a sudden and sharp development of all art forms. The 1st Dynasty, which together with the long and colorless 2d makes up the Archaic or Thinite period, is marked by conceptual power, strength of design, and technical skill. Though the conventions which mark Egyptian art are evident in relief and painting, fragments of stone sculpture in the round show greater freedom, while many of the small ivory figures are of extreme sensitivity and vitality.

In the reign of Zoser (Zosorthros), the 2d king of the 3rd Dynasty, a tremendous advance in architecture was made, which can be laid with great probability to his minister Imhotep (Yemhotep), who, later deified in his own name, is one of the few great figures to emerge from the anonymity (see above) of Egyptian art. Imhotep, the Imonthes of the Greeks, seems to have been the Egyptian Asklepios. Not only a scientist and physician, he was also an architect. It was under Zoser, according to Manetho, that the first stone house was built (probably a reference to the Stepped Pyramid at Sakkara); also the first funerary temple, which shows most of the characteristics of the developed Egyptian style —paneled limestone walls, rows of lotus-reed columns and other columns resembling the single papyrus stalk, and capitals shaped like its sample bell-like flower. The stepped pyramid, as well as subsequent pyramids, was a special form of the typical tomb of the nobility called a **mastaba**, from the native word meaning "bench," to which the tomb structure has a slight resemblance. Zoser's reign gave an impulse to architecture which resulted in the building of the **Pyramids**, the Great Pyramid of Khufu (Gr. Cheops), the 2d Pyramid of Khaf-Re (Gk. Chephren), and the 3d Pyramid of Menkaw-Re (Gk. Mycerinus) at Gizeh. The tremendous size of these structures to-

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

gether with the numerous smaller pyramids in their vicinity give the name Pyramid Age to the time, but it is to be noted that the pyramid form was used in many subsequent ages though not in the same magnitude or purity of construction. The pyramids, oriented with their faces toward the cardinal points of the compass, were built of large blocks of masonry (for Great Pyramid 4′ x 6′ x 20″ approx.), which were then faced with carefully tooled stones so that when finished the sides were smooth. The nature of facing stone varied, limestone and granite being used. The stone masonry of the entire period is remarkable for its precision and finish. The famous Sphinx (Egypt. Harmachis) resulted from a fortuitous use of an outcropping of limestone in an old quarry. Its form at smaller size is common in Egyptian art.

Stone buildings were of post and lintel (trabeated) construction. The corbeled arch was used in some cases to span internal openings and to relieve lintels of excessive weight (see Great Pyramid, above), but the true arch and vault were used only in trenches or below ground, where there was adequate abutment. Tomb paintings and similar records show that some buildings employed the arch and vault and were sometimes capped by a form resembling a dome, but these types of construction seem to have been reserved for the more temporary buildings built of brick with pressed mud roofs.

During the first four dynasties we continue to see strong indications of earlier Mesopotamian influence. The paneled style of brick walls, the first stepped pyramids similar to the Babylonian Ziggurat, the character of early representation of animals, the use of the seal cylinder, which soon disappeared in Egypt though retained in Mesopotamia, and finally the knowledge and use of the true arch in the relatively temporary buildings of brick—all point to direct influence or to elements received by each culture from a common source. These indications increase in importance in view of recent discoveries in the lower Euphrates valley, which point to a greater antiquity for the early cultures of Mesopotamia. (See MESOPOTAMIAN ART.)

Both painting and sculpture now embodied the fully developed conventions which characterize Egyptian art through its long history. Neither form ever lost its association with picture writing, so that even in the periods of greatest realism colors were applied in flat tones practically devoid of shading, and no attempt was made to solve the pictorial problems of atmospheric depth or linear perspective. This resulted in an art in which beauty of line, silhouette, and color pattern predominated. Painting, except within tomb chambers, was employed least because of the relative impermanence of distemper, fresco not being used. In all periods, but particularly in the earlier dynasties, male figures in painting or painted sculpture are colored a red brown, while female figures are a light buff or tan. In both relief and painting the human figure shows the head in profile, eye in front view (a few exceptions show an attempt at profile; example, wood panels of Hesi or Hesi-ra, Cairo). Shoulders are in front view, but waist and hips again in side view, producing the peculiar "hourglass" type. Again, the legs are in side view, one advanced before the other, but with both feet flatly upon the ground line. A sense of action is produced by the quality of line rather than by naturalistic portrayal.

Sculpture in the round is marked by greater realism, enforced by its three dimensional nature, and the desire for a portrait image. (See above.) There was strong descriptive portraiture; however, it was confined to the head and face, characteristics of the body being indicated in a most general manner with no attention paid to accuracy of anatomical detail. While the figures show great variety, each follows certain rigid conventions. Seated figures have legs and feet close together. Standing figures (sometimes attached to a background slab of stone) present the same rigidity regarding the vertical axis. The weight is carried on both feet, but one leg, the left, is extended to the front. The arms are usually tight to the sides or one is extended forward, usually the left. The planes of front, back, and sides are strongly developed, giving the figures their characteristic squareness. The failure to bend or twist the figure about the vertical axis, which produces a distinct "front facade" in the figure, has been termed the Egyptian law of frontality. (Observed also in Babylonia, Assyria, and archaic Greece.) Practically all statues and reliefs were treated with color, conventionally applied. Most of this has disappeared. Outstanding examples—Sculpture: Sheik-el-Beled (Mayor of the Village) in wood, painted, Cairo; the large Khaf-Re in diorite, Cairo; the Seated Scribe of the Louvre, in limestone, colored; Pepi I, in beaten copper, Cairo. Painting: Geese of Medum, Cairo.

MIDDLE EMPIRES: While the political and art center was at Thebes in Upper Egypt, what little change there was in art forms is seen in

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

the tendency toward greater stylization and formality. The 12th Dynasty is noted for the craftsmanship of its ivory carvings, scarabs, and various forms of glazed pottery (faience). In architecture, rock-cut tombs replaced the mastabas of Lower Egypt. Examples at Beni-Hassan.

HYKSOS: During this period the decline already noted was accelerated. About this time the rectangular burial chest was replaced by a coffin made of inferior native wood fashioned with a human head and roughly shaped to the body, which came to be the rule from that time on. The industry for the manufacture and decoration of mummy cases must have been prodigious.

NEW EMPIRE: This age saw an upturn in art quality, particularly in the 18th Dynasty. Except for the pyramids the architectural remains of the earlier dynasties are fragmentary, partly because of the rebuilding of temple structures at later dates. With the 18th Dynasty, however, this character changed; temples and tombs are more or less complete.

*The temple* now took its final form, which was maintained until the Roman era. It is symmetrically arranged about a major axis and is approached by a long avenue, usually flanked by recumbent lions or sphinxes (human-headed lions). The avenue terminates at a great gate structure or pylon, generally preceded by a pair of obelisks, and against which are fastened great poles from which banners were hung. A central gate through the pylon provides entrance to the forecourt, a rectangular enclosure bounded on its lateral sides by high walls, against which stand covered colonnades. Usually these colonnades are continuous on at least three sides of the court, forming an interior peristylar treatment adopted with minor variations by both Greeks and Romans. On the far side of the forecourt from the pylon lies the largest covered room of the ensemble: the hypostyle hall, so called by reason of the numerous columns needed to support the roof. Behind this in regular progression upon the main axis lie one or more antechambers, and finally the sanctuary containing the cult statue. Surrounding the sanctuary are numerous small rooms for the use of the priesthood, which are made part of the temple unit by an enclosing wall. The main rooms excepting the sanctuary, which varies, lie with their longer dimensions at right angles to the major axis; therefore their chief entrances are on the longer sides (also customary in Mesopotamia). The ceilings become lower as the sanctuary is approached, a condition which, together with the gradual shutting off of natural light, produces an effect well suited to a ritualistic cult. Walls both of the pylon and the inner rooms of the temple are profusely decorated with colored reliefs. Many temples multiplied the architectural features and added others, which gave variety to the more simple form, but the deviation from the axial scheme is made only in the most exceptional cases and is due mainly to topographical expediency. Two features, the entrance pylon and the hypostyle hall, evidences of which rarely occurred in earlier periods, were in common use; while the clerestory, i.e., the raising of the walls of the central section of a hall above the height of the roofs of the side portions in order to secure light by vertical openings in these upper walls,—which was used in a modest form in the Old Empire, reached full development in the New Empire. The classic example is the Hypostyle Hall of the Temple of Amon at Karnak (19th Dynasty), containing 134 columns within a space of 170′ x 329′. The twelve columns of the central avenue are 70′ high approximately. The large clerestory openings were filled with pierced stone trellises, ample fragments of which remain. The architecture, however, was clumsy, and the craftsmanship less skillful than in the earlier periods.

Rock-cut tombs and tomb temples reached their greatest size and magnificence, evidenced early in the 18th Dynasty by the tomb temple of Queen Hat-shepsut, constructed for her by the architect Sen-mut at Deir el Bahri, and in the 19th Dynasty by the Great Speos and Little Speos of Rameses II at Abu-Simbel.

In the 18th Dynasty painting confined itself largely to recording scenes from everyday events, and the delicate colored reliefs showing Queen Hat-shepsut's expedition to the land of Punt (Somaliland), as well as the reception of the ambassadors from Crete, are important as well as beautiful historical documents. Later in the 19th and 20th Dynasties painting became far more profuse and elaborate, sacrificing quality for magnificence. The general trend in sculpture and painting was toward greater stylization, formalization, and conventionality. The one exception was in the brief period of Akh-en-aten's religious revolt. At this time the shackles of conformity seemed lifted from the artist, and an art of brilliant and vital realism developed. Thutmosis, who evidently served Akh-en-aten as court artist, is one of the few sculptors who emerge from existing records as definite personalities. Sensitive portraits of the king, identified as his with reasonable certainty, show a depth of

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

feeling entirely missing in the subsequent periods. A further example of this period is seen in the justly famed portrait of Akh-en-aten's queen, Nofretete (Berlin), done in limestone, painted, with eyes of inlaid rock crystal. However, the highly stylized reliefs and statues of Seti I (Temple of Seti I, Abydos), and of Rameses II show an art of finished technique, whose grace and subtlety of line represents an attainment unequaled in its peculiar field. Toward the close of the New Empire sensitivity of feeling gave way to an almost vulgar display in which the lavish use of gold and color fails to compensate for the poverty of ideas.

SAITE PERIOD: Nothing noteworthy disturbed the relative mediocrity of the art forms until the 20th and 26th Dynasties. At this time there seemed to develop a conscious attempt to imitate and revive the art character of the Old Empire. Portrait statues were designed in the dress of the 4th and 5th Dynasties. Sometimes the imitation is so perfect that it is difficult to date the statue if its inscription is missing. Portraiture in sculpture reached a new high of technical excellence as well as literal fidelity to the model and may be compared to Flemish portraiture of the early 15th cent. A.D. However, this revival had little vitality, and its archaistic forms soon succumbed to the influence of Greece and Rome.

PTOLEMAIC PERIODS: Imitation of the Old Empire was replaced by imitation of the New Empire, from which the worst elements were retained and the virtues discarded. Added to this were mannerisms and motifs taken from the fully developed style of Greece and Rome. Several temples were built which have distinction if not brilliance, among them being the great temple at Edfu, the Hathor temple at Denderah, and the Isis temple with its accompanying buildings at Elephantine. These, though presenting variations in the design of details, emphasize the unchanging nature of Egyptian architectural forms.

MATERIALS AND TECHNIQUES: In the long period from its beginnings till its final extinction under the Romans Egyptian art shows a consistency in the use of materials as well as art forms. Good limestone and granite were plentiful, but so was the thick mud of the Delta and river valley, which was used for sun-dried brick. Wood was scarce, and from earliest times the finest timbers were imported from Syria. Other importations were the dense stones used for sculpture, such as diorite, basalt, and obsidian. Alabaster was plentiful and because of its softness was used extensively from earliest times. Ivory was used extensively and readily imported *via* the Eastern trade routes as well as from Nubia and the Sudan. Gold came largely from Nubia, and as early as the 1st Dynasty expert craftsmanship was shown in the fashioning of gold jewelry. Gold wire, however, was hammered. There is no evidence of drawn gold wire in ancient times. Silver, known as white gold, was considered almost equal in value with the yellow metal, owing to the necessity of importation and the resultant scarcity. The use of copper, both hammered and cast, though early casting was of solid metal in an open mold, is seen in Pre-dynastic times. The casting of figures by the "lost wax" process seems known as early as the building of the Pyramids. However, the large portrait statue of Pepi I of the 6th Dynasty seems to have been completely hammered out. The use of bronze, while not as early as copper, was thoroughly understood and developed at the time of the 12th Dynasty.

Glazed pottery was known from prehistoric times and by dynastic times the skill to glaze large surfaces was perfected. In early times the favorite colors were blue and blue-green. In the New Empire and later great varieties of colors were used. While the use of glaze was very early, glassware itself did not appear until the New Empire (*ca.* 18th Dynasty). Blown glass objects did not appear until late Ptolemaic times, the blow pipe seeming to be an invention of the early 1st cent. B.C. In all of the minor and decorative arts the artist was allowed greater freedom from the rigid conventions applying to architecture and the more monumental sculpture and painting.

The art of Egypt was strong as long as its gods were strong. Religious utility was always its motivating force. When that religion died because it could offer nothing to the concepts of the Christian era, the art died with it. The art forms themselves seemed only provincial and childish to the citizens of the Roman world. A few religious motives were taken by Coptic art; the old symbol of life, sometimes known as the Key of the Nile, became the Christian cross; the peristylar court, the clerestory window, and the leafed capital are reflected in different forms in Greek, Roman, and subsequent architectural styles. Beyond this Egypt offers only an abstract beauty of forms and surfaces which will last just as long as the materials from which they are fashioned shall last. See Jean Capart, *Egyptian Art,* 1923; Roger Fry, *Last Lectures,* 1939; H. R. Hall, "Egypt" (in part),

**Egyptian blue.** The bright, rather pale blue color found in wall paintings of Egypt and of other parts of the Mediterranean basin through classical times is Egyptian blue. It is closely related to the blue glaze of Egyptian pottery making. It is artificially made and is inorganic, and, although the ancient method of manufacture is not known, it has been synthesized in modern times by heating a mixture containing silica, a copper compound, calcium carbonate, and the natural sodium sesquicarbonate. Recently such a pigment has been produced for the market under the name, Pompeian blue. —G.L.S.

**Egyptian fabrics.** Earliest variety of pile structures on record. Pile was obtained by drawing selected shots of weft, at intervals in the width of the fabric, into loops or tufts. These looped yarns varied in length and frequency. —B.E.J.

**Egyptian pottery.** See CERAMICS II.

**Egyptian theatre.** See THEATRE.

**e-hon** (Jap.). Literally, picture book.

**eidotropic tendency.** See PSYCHOLOGY OF DRAWING AND PAINTING.

**eight.** See SYMBOLISM IN FAR EASTERN ART.

**Einfühlung** (Ger.). See empathy.

**Eirene** (Gr. *Eirene*). In Greek mythology the goddess of peace.

**ekkyklema** (Gr.). See STAGESETTING.

**e-kotoba** (Jap.). A scroll painting which includes both painting and text.

**electric action** (of an organ). See electrical instruments.

**electrical instruments** (musical). Electricity has been one of the great transforming agents of the present century. It has not failed to affect the development of the musical art. It has served as an auxiliary, a substitute for a mechanical means as in the **electric action** of the modern organ. Here the finger merely makes an electrical contact, thus actuating an electro-magnetic apparatus which does the actual work of admitting a stream of air to the organ pipes. It has, through the agency of the **thermionic valve** or **three-element tube,** functioned in the most varied fashion. This tube not only has a fundamental function in radio broadcasting (q.v.) but has transformed the phonograph (q.v.) into an instrument of high fidelity. Moreover in its function as an amplifying agent it has served to fundamentally alter existing instruments and is employed to produce sound in ways which are new to music.

In the **electric guitar,** for example, the instrument is played in the usual fashion. The sound is received, however, by an electro-magnetic pick-up and can be amplified to an almost unlimited extent by an amplifying stage and a loud speaker which are connected in the circuit. An apparatus similar in general principle has substituted electrical amplification for the mechanical amplification of the piano sound-board. The pioneer instrument of this kind was the **Neo-Bechstein piano.** Here the strings are thin, single, and are struck lightly by small wooden hammers in contrast to the grand piano with its thick strings grouped in twos or threes, save in the lowest register, and under tremendous tension so as to obtain the greatest sonority by mechanical means. The sound of the struck strings in the Neo-Bechstein piano, however, is picked up by a series of microphones, amplified, and passed through a cabinet containing a loud speaker.

The **Everett Orgatron** also uses a familiar sound source, in this case vibrating metal reeds of the harmonium type. The vibrations are received electro-statically by "tone-screws" placed opposite the ends of the reeds. These vibrations are amplified and made audible by a loud speaker in the usual manner. This instrument has the external appearance of a pipe organ with two manuals, pedal board, swell pedals, and tilting tablets to control tone quality and volume.

It has also been found possible to produce musical sound by using a purely mechanical means to produce periodic electrical impulses. These impulses may in turn be converted into audible sound. This was demonstrated by Thomas Cahill who, in the first part of the 20th cent., produced periodic electrical vibrations by wheels with regularly spaced teeth which were rotated in an electro-magnetic field. Among several instruments developed on similar lines the one which is the most familiar to American readers is the **Hammond organ**

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

developed by Laurens Hammond of Chicago. Here, however, a revolving "tone-wheel" or disc replaces the toothed wheel of the apparatus described above. The controls of the Hammond organ are in general those of the pipe organ, save that a means of controlling the harmonics present and their relative intensities is provided in the form of adjustable draw-bars above the upper manual. This provides a novel means of controlling tone color.

Still more novel are instruments utilizing the light sensitive selenium cell to provide periodic electrical impulses. In the **Superpiano** of Spielman (1927) a series of electric light bulbs are placed behind revolving discs which are pierced with a series of holes. Thus an intermittent ray of light falls on the **selenium cell** which has the power of converting light into electrical impulses. These in turn are converted into audible sound vibrations. Though the instruments based on this principle have as yet played no considerable role in the concert hall, the use of an apparatus similar in principle in reproducing the sound track of moving picture films gives clear evidence of the practicability of the method.

Finally, a group of instruments produce sound by purely electrical means. If two electrical circuits each containing a thermionic valve are so arranged that the frequency of one of them can be varied by the use of a variable condenser, an audible beat-tone equal in pitch to the difference between the frequencies of the two circuits is heard. In the **Theremin** (named after its inventor, Prof. Theremin of Leningrad) the right hand of the operator, which is moved nearer or farther from a rod connected with one of the valves, serves as a variable condenser. The differential tone is higher in pitch when the hand is close to the rod, lower in pitch as it moves away. Improvements on the apparatus have taken the form of a switch operated by the left hand to eliminate the glissando effects produced as the right hand moves from one position to the other and of guides of various kinds to enable the performer to locate the various pitch positions more simply. Other workers have constructed keyboard instruments utilizing similarly produced beat tones. In these cases, however, the second circuit is no longer variable but is set at a point which will produce vibrations of the desired frequency. The **Klaviatur-Sphaerophon** of Jorg. Mager (1928) contained three series of such units, each series controlled by its own keyboard. Thus the instrument was no longer restricted to melodic music but could play music in three parts.

Obviously, the field of electrical instruments is still so new that any study written at the present time can do little more than point out some of the broad areas which have been explored and some of the broad principles which are involved. The changes which may be effected in the future by electrical instruments may well be revolutionary in their results and might conceivably replace the conventional types of musical instruments with novel forms presenting possibilities which can be foreseen only dimly at present.

——C.W.H.

**electrical porcelain.** Hard porcelain for insulators; one fire body and glaze. See CERAMICS I.

**electric guitar.** See MUSICAL INSTRUMENTS; electrical instruments.

**electric oscillation.** See ACOUSTICS.

**electrum.** An alloy of gold and silver, natural pale-yellow in color.

**elements of design.** See design.

**elemi.** Known commercially as gum elemi, this is a sticky, resinous material, usually viscous like a balsam, which comes from a variety of trees common to the Philippine Islands, South America, Africa, and the East and West Indies. Its principal use in the arts is as an addition to varnishes, though it has been included in wax combinations for the relining of pictures. —G.L.S.

**Eleusinian.** Pertaining to Eleusis in Attica, Greece, the principal seat of the worship of Demeter and Persephone in Greece and the site of the shrine at which initiation into the Eleusinian Mysteries took place. —L.T.S.

**elevation.** The vertical arrangement, in an architectural design, of its elements.

**Elizabethan architecture.** During the reign of Queen Elizabeth, from 1558 to 1603, English architecture passed from the medieval through a phase corresponding to the high Renaissance in Italy into the baroque. Henry the VIII had broken the medieval church, and the new buildings, such as Longleat, Montacute House, and Wollaton, were expansive secular palaces, in keeping with the prosperity and relative security of the reign. Italy early contributed classical logic of planning and the ancient orders, but the latter were so superficially

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

applied that they quickly gave way before the close of the 16th cent. to a new veneer in the baroque style. —P.C.B.

**Elysian fields** (Gr. *Elysion pedion,* E. field). In Greek mythology, the abode of the blessed dead who had been righteous in life; believed to have perpetual springtime, flowers, happiness; in early Greek writers located in the western ocean or at western edge of the world, later in the underworld. —L.T.S.

**émail** (Fr.). Enamel.

**e-maki** (Jap.). A scroll painting, usually with text included.

**e-makimono** (Jap.). *The makimono* is a rolled horizontal scroll; *e-makimono* is a rolled horizontal picture scroll.

**emblazon.** See HERALDRY.

**emblem.** An allegorical or symbolic device designed pictorially to convey an abstract meaning. As this definition implies, emblems do not constitute a logical or semantic category but merely a historically determined group. The vogue of emblems arose during the Renaissance in consequence of the then prevalent preoccupation with hieroglyphics (q.v.). As their popularity grew, the demand for variety resulted in the invention of more and more abstruse pictorial devices so that it became profitable to publish explanatory manuals, so called **books of emblems.** Since emblems often were metaphors or epigrams transposed into the visual medium, these books influenced the language of poets as well as that of sculptors and painters. —R.B.

**embossed.** *Book.* Leather or other material with a raised design worked by hand or plates.

**embouchure.** That part of a musical instrument applied to the mouth.

**embroidered rugs.** Used in Germany as early as the 15th cent. Early American embroidered rugs were produced during early 19th cent. Only a few in existence.

**emerald green.** Occasionally confused with viridian or verte emeraude, emerald green is a distinct pigment, a copper aceto-arsenite. It is bright in color and rather bluish green. It was first made at Schweinfurt, Germany, in 1814 and has sometimes been known as Schweinfurt green. Another name is Paris green. It is identical with the insecticide which also carries that name. Although fairly permanent in an oil or varnish medium, it can be blackened by sulphurous air or sulphurous pigments, and it is poisonous and dangerous to handle. —G.L.S.

**eminent domain, right of.** See CIVIC PLANNING.

**Emmaus.** According to *Luke* 24, 13, a village "which was from Jerusalem about threescore furlongs". After his resurrection, Christ went there with two of his followers who did not know him. When Christ sat down at table with them at Emmaus and broke the bread, they recognized him by the sacred action and by the wonder of the subsequent disappearance of Jesus. The subject has often been treated in art. Best known, perhaps, are the various versions by Rembrandt. He was greatly attracted by the Emmaus scene and has treated it in several etchings and paintings. —L.L.

**emotional buoyancy.** A general name for the quality which enables a work of art to hold the attention and interest of an observer while its subtler and less insistent qualities produce an effect on him which they could not produce without some such aid. In music this buoyancy is supplied by the volume, the purity, and the essential continuity of the sound; in architecture, by the size, the height, and the obvious weight of the building—or occasionally by some less universal quality, such as the richness or rareness of the material. There are few arts that can dispense with this quality entirely. See Carl Thurston, *The Structure of Art.* —C.T.

**empaistic, empaestic.** Inlaid, embossed, or stamped

**empathy.** A word, artificially composed of Greek elements (*em-pathein*) to serve as an equivalent for the German **Einfühlung,** which literally means "feeling-into". It denotes the subconscious act of projection by which we attribute to an object our own kinesthetic sensations, motor impulses, moods, emotions, attitudes, and thoughts, perceiving these mental features as if they belonged to the object and formed what has been called its "tertiary qualities." The hill is experienced as 'rising', a spire as 'pointing to heaven', a spring day as 'smiling'. The phenomenon was described as the "animation of the inanimate" by Aristotle (*Rhetoric* 1411 b 32), and as "pathetic fallacy" by John Ruskin (*Modern Painters* Part III, Sec. II, Ch. 3, §31). But only after the term **Einfühlung** was ushered into the aesthetic discussions by Robert Vischer (*Das*

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

*optische Formgefühl,* 1873), attempts have been made to find in empathy the clue for an interpretation of aesthetic enjoyment. The chief representatives of modern empathy aesthetics are Theodor Lipps, Johannes Volkelt, Karl Groos, Victor Basch, and Vernon Lee. See Earl of Listowel, *A Critical History of Modern Aesthetics,* 1933, pp. 51-82; K. E. Gilbert and H. Kuhn, *A History of Esthetics,* 1939, pp. 537-540. —H.K.

**Emperor.** See ORIENTAL MUSIC.

**Empire style.** A term applied to the neoclassic mode which prevailed in France during the ascendancy of Napoleon Bonaparte, from about 1796 to 1815. A natural outgrowth of the stricter classicism of the late 18th cent. which was promoted by scientific archeology, it was particularly congenial to Napoleon's dreams of Roman grandeur. After 1798, sphinxes and other Egyptian motifs were added to the Roman repertory to celebrate the Egyptian campaign. The furniture in the style tended to a combination of rectangular massiveness and swelling curves, and was embellished both with heavy textiles, often exhibiting the "N" of Napoleon or the symbolic bees, and with much bronze appliqué. In America the style is associated with the relatively simpler furniture named after **Duncan Phyfe.** Probably the most noted architectural representatives of the style are the Arc de Triomphe de l'Etoile and the Temple of Glory (now the Church of the Madeleine), begun by Napoleon in 1806 and 1807, resp. —P.C.B.

**emulsions.** Among the painting mediums is a group in which drops of one kind of liquid are suspended in another liquid with which the former would not form a stable mixture. Perhaps the most common emulsion in the history of painting is the yolk of egg where a natural emulsifying agent keeps the two types, the egg-oil and the watery, albuminous mixture, in a stable suspension. Other emulsions can be made by mixtures of gums or glues with oils and varnishes, with the addition of a suitable emulsifying agent. Oil added to the egg yolk is still another. There has been some argument in favor of the theory that emulsions explain much of the character of late Renaissance oil painting and that they were important in the development of the handling of oil paint through the 17th and 18th cents. No very great amount of evidence has been brought together to support these arguments, but specific evidence about painting mediums during this period is still very slight. —G.L.S.

**enamel.** Fine glaze, opaque. See CERAMICS I.

**ENAMELLING ON METAL.** The process of enamelling consists of applying a thin coat of glass to certain metals, raising them both to a red hot heat, thereby melting the glass, and fusing it to the metal.

This type of enamelling should rightfully be termed **vitreous enamelling** to differentiate it from enamelled furniture, or automobiles which is accomplished by applying a resinous substance to a metal surface, and hardening it by baking in an oven at slightly above the boiling point.

There is some vagueness connected with the origin of the word "enamel", although the French word *esmail* leads us to believe it is connected with our word "smelt", and the German word *schmeltzen,* from which we also derive the word "smalt".

The vitreous glaze will adhere to some metals such as gold, silver, copper, and fine bronze (copper with a small admixture of tin), but will not adhere to nickel, zinc, or brass, which is a mixture of copper and zinc. A metal known as **colonial brass,** which is either 90 or 95 percent copper can be successfully enamelled if only one firing is required. However, on subsequent firings the alloy always causes trouble, and gives a streaked, or blistered effect. For the most beautiful transparencies it is advisable to use pure gold, fine silver, or pure copper.

Enamel is composed of silicates of various materials forming a colorless transparent glass called **fondant** in French, and **flux** in English. To this flux color is added by means of introducing small quantities of metallic oxides. An opaque white is made by melting the flux with oxide of tin, a yellow is obtained by the use of oxide of iron, or uranium. Manganese gives violet, and gold oxide produces our most beautiful reds. Cobalt will give an ultramarine blue, chromium a certain shade of green, and iridium a steel gray, or black.

The historical importance of the art of enamelling cannot be ignored. Its antiquity is assured, although confusion as to the authenticity of Egyptians, Babylonians, and Assyrians using enamels is still extant. The close resemblance to enamels in these cases is said to be pieces of inlaid glass, or colored stone.

There is no doubt that the work of the Celts, and the Saxons on the British Isles

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

in the year 240 A.D., and continuing from the 6th to the 9th cents., was truly enamelling as we understand it today. They were said to have poured colored glass into molds to decorate their horse-trappings, shields, and armor-plate of fine gold and bronze. Originating in Persia was another type of enamelling called cloissonne and as that from the British Isles travelled eastward, the Persian type travelled westward, and met in Byzantium, where from the 9th to 11th cent. flourished the greatest enamelling era in the world's history. It was the strong religious feeling, and the desire for beautification that found in enamels the perfect vehicle for expression.

From Byzantium enamelling found its way to Europe, and followed the spread of Christianity. We find superb examples which were produced in Saxony, Brunswick, and along the valleys of the Meuse and the Rhine. By the second half of the 12th cent., France had acquired enamellers from Germaney. It was then passed on from the French to the Italian craftsmen during the 13th and 14th cents. and on into the Renaissance. We find the cities of Lorraine and Limoges the most important centers of enamelling in the 15th and 16th cents. Four top-ranking personalities from this great period stand out. First there was Nardon, or Leonard Penicaud apparently the eldest of the family, then Jean Penicaud, probably a brother, but often spoken of as Penicaud II, Leonard Limousin, and Pierre Raymond who were equally important during this time, produced quantities of fine pieces. A decided decline came about through the unwise dictatorial powers which Louis XIV exercised over the artisans of his time. The atmosphere surrounding the court was not conducive to the higher forms of art, and we find less opportunity given for creative work. Copies of paintings by Watteau, and Fragonard of superficial court life were adapted to snuff-boxes, and watch-cases. These made chiefly in Battersea, and Bow in England, showed skill in craftsmanship, and delicacy in drawing, but could hardly be considered as much more than pretty art.

The Japanese enamels are almost entirely done in the cloissonne method, and while superbly executed, are sometimes monotonous in their use of pale opaque colors. The more glaring work of the Chinese usually done in brilliant reds, blues, greens, and yellows on a white ground, is inferior to the Japanese enamels in many cases.

After an almost total lapse of interest in handicraft during the 19th cent., enamelling has emerged as one of the important forms of decoration, made possible with many new discoveries in chemistry, and mechanical inventions. A renewed interest in creating more beautiful utilitarian objects has inspired a handful of craftsmen throughout this country to keep alive the great traditions of enamelling as a fine art expression. Paralleling this effort, we also find enamelling being commercially produced for a variety of purposes, including bath tubs, kitchen sinks, automobile name plates, gasoline stations, and imitation shingles.

The process of enamelling is within reach of anyone with a sense of craftsmanship, and artistic ability. The tools for applying the enamel consist of a small spatular, a scriber or awl, and a spreader, which is made by bending a wire at 60 degrees and inserting it into a wooden handle. In general, the process can be divided into three parts; cleaning and preparing the metal to be worked upon; applying the enamel; and firing. The cleaning consists of three simple operations, which if followed carefully will assure success.

Careless preparation is the common cause of inferior work. First, the metal is cleaned in acid. In the case of copper, which is generally used, a solution of one part chemically pure nitric acid to one part water or two parts commercial nitric acid to one part water make up the acid bath. Secondly, the copper is rubbed briskly with fine steel wool. Thirdly, an application of saliva, being a weak alkaline solution, guarantees a perfectly neutralized surface upon which to work.

After scratching the design with the **scriber,** a small amount of enamel is taken from the jar with the **spatular**, and worked into place with the scriber while still moist, and then carefully leveled off with the **spreader.** The entire surface must be covered before firing, and care should be taken in juxtaposing the colors. It is necessary to keep the whole design continually wet. This can be accomplished by the use of a small atomizer. A weak solution of gum tragacanth is now sprayed on the design to help hold the particles in place. It is customary to use enamel ground to 60 or 80 mesh, but for detail work it may be ground to 200 mesh, and applied in the form of a paste, using oil of sassafras as the vehicle. When the piece is thoroughly dry, it is placed in a muffled electric kiln, and raised to 1400 deg. F., or 1800 deg. F., according to the average melting point of various hard and

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

soft enamels which have been used in the design. A concave tray or bowl, may be fired on the concave side only, but if a convex plaque is to be made, it is advisable to counter-enamel the copper, to counteract the coefficient of expansion in the metal and the enamel as it cools.

When working on copper, more brilliant effects can be obtained with the transparent colors, by firing silver, or gold foil (No. 4, non-adhesive) onto a layer of enamel, and then proceeding as if working on the more precious metal. The cold colors are more successful over silver, and the warm colors over gold. Opaque colors can be used over any of the above mentioned metals.

For a fine finish, the work should be stoned with a carborundum stick under constantly flowing water, then refired.

The type of enamelling just described is called **painted enamel.** The colors are merely fused to the copper, and allowed to flow together. In the type called **cloissonne,** thin wires are used to separate each color. This is the most ancient process, and a term which is greatly misused. The word comes from *cloissons* meaning cells, into which the colors are placed. In the **champleve** type, the area which receives the enamel is either etched, or carved away, enabling the metal to show in places. There is a type of enamelling called **plique-a-jour.** It is a translucent enamel without a background which is accomplished by cutting away small areas from the metal and holding the enamel in place by capillary attraction, and then firing on a sheet of mica. After the mica is removed, the effect of small stained glass windows is achieved. **Basse-taille** enamelling is really a low relief, upon which transparent enamel is fused. **Grisaille** is an effect of light and shade produced in painted enamels, whereby a background is covered with opaque white, and modulated to produce the desired gradations.

The possibilities in the medium of enamelling are endless. Not only is there the variation of coloring caused by different heats, but the combinations of enamels on various metals, and the effects of superimposition of the transparent colors and refinement of detail make enamelling an art which warrants the time and study of the artist, and repays in gratifying dividends. See H. H. Cunynghame, *Art-Enamelling on Metals;* K. Gibson, *The Goldsmith of Florence;* A. Rose and A. Cirino, *Jewelry Making and Design.* —K.F.B.

**encarpus.** *Arch.* A festoon, flower, etc. ornament on a frieze or capital.

**encaustic painting.** An ancient method of easel and mural painting which employs pigments mixed with refined beeswax, with or without modifying ingredients (e.g., oils or resins). The paints are applied and manipulated with the aid of heat but the term, which implies a strong burning in of the colors does not apply literally to any of the accepted versions of the process in which the molten wax colors are manipulated over the surface with a brush and **cestrum** (one of an assortment of spatulate metal instruments or **cauteria**). Encaustic was apparently a major, if not the principal painting method employed during the entire classical period. No Hellenic Greek specimens or technical accounts of the process exist, but there are many literary allusions to it. The method was described in some detail by Pliny the elder, and referred to by Theophrastus and Dioscorides. Best known surviving examples are the Fayoum mummy portraits; these are described by some as Greek, others cite evidence to show that encaustic may have originated in Egypt. A notable find in 1845 of a complete encaustic painter's equipment in a tomb at St. Médard-des-Prés established or confirmed the details of several of the materials and instruments used. Encaustic became obsolete during the 9th cent. Although the medium is extremely permanent and has desirable textural and optical qualities, its manipulation is rather dfficult to control. 19th and 20th cent. revivals have been sporadic and isolated. **energy transmission curve.** See COLOR.

**engaged column.** A member belonging to and projecting from a wall, with the appearance of a column but not free-standing; an applied column.

**engineer.** See RADIO DRAMA.

**engineering, aesthetics of.** Considering engineering constructions as tasks of architecture and therefore as phenomena of art is not a discovery of modern times. Roman aqueducts, mediaeval fortifications, and Renaissance bridges are exactly as much solutions of specific technical problems as modern factories and railway stations. The only distinguishing fact is the use of new materials of engineering, iron, steel, and reinforced concrete. These new materials began to find their artistic expression beyond the mere fulfillment of technical needs at the beginning of the 20th cent. Some pioneer work in this direction was done already in the 19th cent.: Paxton's Crystal Palace at the World Exhibition, London, 1851; the Engineering Hall at the World Exhibition, Paris, 1884; the Eiffel Tower, Paris, 1889; many iron and steel bridges throughout Europe; the Brooklyn Bridge in New York, N. Y., 1883, etc.

Today, the borderline between technical construction and architectural creation is hard to fix, even in mere technical constructions like silos, hangars, bridges, and plants. Cooperation of engineer and architect is becoming usual. The same is true for the shaping of non-architectural utensils and machines, like locomotives, cars, etc. Objects of daily use like lighting fixtures, kitchen units, telephones, refrigerators, etc., originally mere problems of engineering and fabricating calculation, become subjects of artistic consideration as tasks for the industrial designer. **England, architecture of.** See GREAT BRITAIN, ARCHITECTURE OF.

**ENGLISH ART.** The beginnings of English art reach back to Anglo-Saxon times. A crude country slowly developing under the civilizing influence of the medieval church, the English were largely dependent on the Continent for both art and decoration. The Venerable Bede's account of the building of the monastery and church of St. Peter near the mouth of the river Wear in Northumberland, may be taken as typical of the methods of the times. Biscop, called Benedict, in 674 began the building by importing masons from Gaul to build a church in the "Roman style"; he also brought over glaziers to make and decorate the windows. Finally, on one of his numerous visits to Rome, he purchased pictures of the Virgin and the Twelve Apostles not only for the adornment of his church but also for the edification of all who could not read. The Danish invasion destroyed Biscop's work to such an extent that only the foundations of his church remain.

English artists doubtless learned from Continental artists; and during the period of the building of the great churches and cathedrals the work of natives and foreigners is inextricably mixed. Of the English who are known by name the most prominent was William of Winchester and later of Westminster. His greatest work was the Painted Chamber at Westminster (1230, *temp.* Henry III), which stood south of Westminster Hall and was destroyed by fire in 1834 together with the Houses of Parliament. That there was much pictorial decoration in the English churches is evidenced by the remains that are scattered over the country, remains which have usually suffered severely in the passage of time or at the hands of later improvers.

With the foundation and development of the monasteries came also the production of manuscripts. The rule of the orders was brought from the Continent and similarly the methods of making and illuminating manuscripts. Matthew Paris of St. Albans (c. 1195-1259) was not only a notable author and illustrator (see his *Historia Major*) but he

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

was also the director of other works written or copied and illuminated by monks working under his direction. After the Conquest as the monasteries rose to the fullness of their life and power, the making of beautiful books flourished. Not all of the work was original, for much of it was based on older pictures and designs which were well known; but every so often there arose artists of great skill and originality whose names are buried in the anonymity of their lives The works which have survived show much of the outpouring of books in mediaeval England: Psalters (e.g., *Queen Mary's Psalter,* the *Tickhill Psalter,* and that which belonged to John, Duke of Bedford), Horae (e.g., the *Taymouth,* the *Carew-Poyntz*), Missals (e.g., *Sherbourne*), Gospels (e.g., one at Pembroke College, Oxford), and innumerable Bestiaries, Chronicles, and Romances. Once again, however, it is necessary to keep in mind the fact that many manuscripts made on the Continent found their way to England and cannot, because of what one may call an international style of writing and illumination, be divided from the native product. But there is sufficient authentic English work, as in the *Psalter and Hours* of John, Duke of Bedford, to justify the statement that at times that work rose to a level equal to the best produced on the Continent.

Upon the conclusion of the Wars of the Roses and under the well established government of Henry VII (1485-1509) came a demand for portraits and secular decoration. Religious painting and church decoration, which languished under this reign, came to an abrupt end in the days of Henry VIII (1509-47). In the matter of portraiture the threads are again mixed, the most notable work being that of foreigners together with some successful portraits by minor English artists. Hans Holbein the Younger (1497-1543), a German, was in England from 1526 to 1528 and again from 1537 until his death. His portraits of the court of Henry VIII are notable both for their style and for their portrayal of character. He was followed by Antonio Mor (c. 1512-75), a Dutchman, who made the great portrait of Queen Mary in 1554. Of the native Englishmen of the time of Elizabeth, Nicholas Hilliard (1537-1619), goldsmith and miniaturist, stands very high because of the radiance of his portraits in color, line, and pattern. The success of Hilliard gave rise to a large school of English miniaturists of varying abilities (e.g., Isaac Oliver, John Hoskins, Alexander and Samuel Cooper). The stability of life in England under the firm government of the Tudors together with the development of a definite court society, gave opportunity for these artists to follow their calling. The Tudors did not, however, show any great inclination to foster the arts and such patronage as they bestowed was incidental and haphazard.

Under James I (1603-25) and Charles I (1625-49) the foreigners are still the prominent painters. Marc Gheeraedts the Younger (1561-1635), a Fleming, was more English than any of these, for he lived in England from the age of seven; his portraits of women and children (e.g., *Prince Henry; The Countess of Pembroke*) are notable for their gentle manner and detailed charm. Daniel Mytens (c. 1590-1642), a Dutchman, was in England from 1614 to 1634 (e.g., *Duke of Hamilton*); Cornelius Johnson c. 1593(-1664), the son of a Fleming, was born in England and appears from his work to have been a pupil of Gheeraedts (e.g., *Lady Waterpark*); after the beginning of the Parliamentary Wars he removed to Holland. Of all the foreigners in England at this time Anthony Van Dyck (1599-1641) was the most prominent. He was in England in 1620-21 and in 1629; in 1632 Charles made him court painter, a position which he held until his death. Van Dyck is of importance not only for the portraits which he painted (e.g., *Archbishop Laud, Lord Philip Wharton, Charles I, Sir Kenelm Digby*) but also for his influence upon English painters in setting a pattern for portrait painting. William Dobson (1610-1646) was probably his most successful pupil. It is interesting to note that the Van Dyck influence, which was Cavalier, continued through the Commonwealth period, as is instanced by Robert Walker's (c. 1600-c. 1660) *Oliver Cromwell and his Squire,* which is wholly in the Van Dyck tradition.

Lely (Peter van der Faes, 1618-80), a Dutchman, who lived in England from 1641 until his death, constitutes the link between the pre-Commonwealth period of Van Dyck and the Restoration; fitting himself to the political situation of the moment, he was always fashionable: his Puritans are dour; his Restoration *Beauties* are sensual. His successor was Godfrey Kneller (1646-1723), a German, who first followed Lely's style but later developed a more free expression of his own. Both of these men reflect the low spiritual level of the Restoration period. Like Lely, Kneller was adaptable and so adjusted himself to the situation after the Revolution of 1688

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

that William knighted him. Of equal importance with his pictures is the fact that in London he founded and directed the first academy for teaching painting. Henceforth the English were to develop their own painters and the reign of the foreigners was over.

With the accession of Queen Anne (1702) began the so-called **Age of Manners** supported by a sophisticated, albeit a rather sceptical, society. The accumulation of wealth under the Whig rule, the building of great houses on estates, and the settled government of the nation, all made possible the patronage of art by the upper classes. As the great fire of London gave Sir Christopher Wren his opportunity to build churches, so the new St. Paul's provided Sir James Thornhill (1676-1734) with a dome to be decorated. It is noteworthy that an Englishman was chosen for this work, an Englishman whose first art education was under Thomas Highmore, a minor artist. Moreover, by virtue of his local reputation Thornhill continued the painting academy begun by Kneller.

William Hogarth (1697-1764), wholly English trained, became the great champion of the English artist in his own country and his efforts were not without success. Because of his method of publishing engraved reproductions, his series of story-telling pictures (*Harlot's Progress, Rake's Progress, Marriage à la Mode, Industry and Idleness*), satirical and moralizing at once, were more widely known than the work of any other artist of his day. His efforts to show ability in great mural paintings were unfortunate and only a few of his portraits are worthy of notice. But he strove valiantly to show that the English could do what the foreigners did, and although his skill was not equal to his patriotism, he gave much encouragement to English artists and patrons.

The latter half of the 18th cent. saw the happy co-existence of a continually expanding upper class able and willing to patronize the arts and a number of artists, particularly portraitists, of genuine worth. Sir Joshua Reynolds (1723-1792), trained at home and abroad, after 1752 speedily became the foremost painter of his day. For a time to be painted by Reynolds was a social requirement. When one considers the large output of his studio, for in his great days he employed assistants, one is amazed at the great number of excellent portraits (e.g., *Captain John Hamilton, Nelly O'Brien, Duchess of Hamilton, Admiral Keppel, Sarah Siddons as the Tragic Muse*). Reynolds knew his generation thoroughly and painted it with just the right mixture of classicism and sentimentality.

Reynolds' influence was greater than his painting; for in 1768 with others he founded, under the patronage of George III, the Royal Academy of Arts. He was its first President and was reëlected annually for twenty-four years. For better or for worse the Royal Academy, with its schools and its annual exhibition, is a factor henceforth to be reckoned with in the history of English painting. In its schools, at least until the end of the 19th cent., nearly all English artists studied and to its exhibitions most of them submitted pictures. Like similar organizations the Royal Academy has developed and taught standards and tradition. Slower to change than the individual, it has at times been behind current thought and has therefore been accused of hampering development; nevertheless, the Royal Academy has given standard and focal point to English art which particularly fits the genius of that nation

Contemporary with Reynolds and by many ranked as his equal was Thomas Gainsborough (1727-88). Wholly English trained, he became in 1759 a popular society painter at Bath, and in 1774 carried his reputation to London where he became the rival of Reynolds, with whom he had a part in the founding of the Royal Academy. His portraits are notable for their delineation of character (e.g., *Mr. Nugent, Karl Abel, The Blue Boy, Mrs. Graham, Perdita Robinson, Captain Wade*). From the point of view of popularity Sir Thomas Lawrence (1769-1830) was Reynold's successor. In demand by 1787, elected A.R.A. in 1791, appointed Court Painter in 1792, and elected R.A. in 1794, this son of a Bristol innkeeper rose to the top with astonishing swiftness. Later times have somewhat lowered this high estimation of his work, for his women have a tendency to be too sweet and his men too theatrically ideal; nevertheless, his portraits have quality and must be accorded a better rating than many others (e.g., *Sir Philip Sansom*, the *Calmady Children, Caroline Upton, Pinkie, George, Duke of Grafton*). Three other society artists of the period must be mentioned: George Romney (1734-1802), who painted some fifty pictures of Lady Hamilton until she became a kind of stock character for him; Benjamin West (1738-1820), American born, who lived in England after 1763 and eventually became President of the Royal Academy; and John Singleton Copley (1737-1815), also American born, who took up resi-

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

dence in London in 1775 and became famous not only for his portraits but also for his rhetorical historical paintings (e.g., *Death of Chatham*). Of Reynolds' students James Northcote (1746-1831) and Thomas Beach (1738-1806) were the most successful.

The 18th cent. in England was much concerned with gardens and the picturesque. In the early decades of the century the formal classical garden with its axis and balance, with its mount and artificial ruined Roman arch, was very popular; later came the so-called natural garden and landscape which by means of a vista maintained an axis but kept the other parts in imbalance. Because this interest in nature pertained to small cultivated and controlled areas, patronage for landscape painting was almost nonexistent. The life of Richard Wilson (1714-82), a landscape painter of no mean ability, is an eloquent example of the difficulties of an artist in this field: in his latter days he was saved from poverty by his appointment as Librarian of the Royal Academy. But in spite of lack of patronage landscape painting, particularly in water color, made progress. Samuel Scott (1710-72), Paul Sandby (1725-1809), and John Robert Cozens (1752-97) were all successful painters of landscape in water color; and their group is fittingly brought to a conclusion by the greatest of them all, Thomas Girtin (1775-1802).

It is often said that Joseph Mallord William Turner (1775-1851) made his way rapidly in the Royal Academy (A.R.A., 1799; R.A., 1802) because there was so little competition in the field of landscape painting, but one hopes rather that the members of the Academy thus early recognized the genius and ability of the man who was to become one of the greatest painters in England. In water color and in oil he had equal facility. Of the quality of his work one must note his skill in giving impressions without attention to minute detail. Ruskin fought hard to demonstrate that everywhere Turner was true to nature, a demonstration which today seems somewhat needless. The greatness of Turner lies in his scope, his grasp of the essence of things. His mountains at times loom large and are overpowering, but such was their emotional effect and Turner has produced it; his skies are luminous beyond any that had ever been seen before and the play of color in them was a revelation to the studio artist. His life-long, one-sided combat with Claude Lorrain (1600-82) damaged some of his work, for his paintings on classical subjects have not the life of his other work, Ruskin notwithstanding. That later the French Impressionists should look upon Turner as their founder and forerunner is wholly understandable, for to Turner form and effect were always greater than detail. Of his pictures the following represent different types of his work: *Coniston Falls; Garden of the Hesperides; Sun Rising Through Mist; Death of Nelson; Crossing the Brook; The Slave Ship; The Fighting Téméraire; Venice; Snow Storm; Rain, Steam, and Speed; Norham Castle.* With Turner landscape painting came into popularity in England, a popularity which it has never lost.

Contemporary with Turner was John Constable (1776-1836), as honest a painter as England ever saw. Whereas Turner frequently rearranged nature to suit his effect, Constable selected but never changed the relationship of objects as he found them. Not being gifted with the rapid and unerring skill of Turner, Constable had to work hard to achieve his purpose; and like Turner he was interested in the portrayal of light and its effect. The following pictures are representative of his work: *The Cottage in the Cornfield; Dedham Mill; The Hay-Wain; Salisbury Cathedral from the Bishop's Palace; Stonehenge.* Other landscapists of the time can only be mentioned: Copley Fielding (1787-1855); W. H. Hunt (1790-1864); David Cox (1783-1859); and John Sell Cotman (1782-1842).

Alone and unheralded stands William Blake (1757-1827) whose scope was that of the universe. By virtue of his religious beliefs he moved in his mind from heaven to earth, to hell and chaotic void, peopling them with characters whose actions and fates are frequently hard to follow and difficult of interpretation. The lyricism of his poetry is marred by defects and yet the lyric quality surmounts the faults; and in his pictures his distortions of the human figure are forgotten in the sweep and grace of the movement which they portray. The colored engraving was his chief medium, for his early training was in engraving; and throughout his work the engraver's precision of line is everywhere evident. Endowed with an imagination far beyond that of the average man, he frequently leaves those who look at his work far behind and rather breathless as they perceive the scope of his beauty. The following represent different aspects of his work: *Pity; Glad Day; The Four and Twenty Elders;* illustrations for Milton's *Paradise Lost, The Book of Job,* Bunyan's *The Pilgrim's Progress; Songs of Innocence* and *Songs of Experience; Jerusalem.*

During the Victorian era the Royal Academy was easily the dominating force in the field of art. Literary painting, i.e., paintings based upon passages or characters in books, flourished (e.g., E. M. Ward's *Doctor Johnson at Lord Chesterfield's House;* C. R. Leslie's *My Uncle Toby and the Widow Wadman;* Frederick, Lord Leighton's *Romeo and Juliet*). The competition for the decoration of the new Houses of Parliament gave added impetus to historical painting. Portrait painting, largely in the tradition of Reynolds, constituted a steady and assured income for all artists.

Perhaps the popularity of the genre picture is something of a key to the Victorian point of view. At this time the number of purchasers of works of art was the largest that had ever existed in England. It was made up not only of the upper classes but also of many who through the prosperous days of the Empire had made money and were willing to spend it. The people of the second category were filled with memories of their earlier and less affluent days and from their vantage ground of comfortable financial security looked back sentimentally on their childhood and youth. Supported by these persons genre painting was much in demand. The Scot Sir David Wilkie (1785-1841), though not the first to do this type of work in England, made genre painting popular (e.g., *The Blind Fiddler; The Penny Wedding*). After him came such men as William Mulready (1786-1863) (e.g., *Crossing the Ford*); William Collins (1788-1847); and William P. Frith (1819-1909) whose *Derby Day* in its size and in the multiplicity of its characters is almost the climax of this type. Even Turner tried his hand in *The Blacksmith Shop* but fortunately was satisfied with this one demonstration of his ability. At the close of the Victorian era with the dying of sentimentality as a dominant force, the vogue for genre painting fell away.

Against all of this kind of painting and the domination of tradition in the Royal Academy rose the **pre-Raphaelite Brotherhood.** In 1848 three young painters, Dante Gabriel Rossetti (1828-82), William Holman Hunt (1827-1910), and John Everett Millais (1829-96), in an effort to get back to truth and reality as they understood them, thought they saw in the work of the artists who preceded Raphael the validity they sought. A noble subject, truthfulness to nature, and extraordinary attention to detail were their cardinal Tenets. Because they were young and had not yet mastered their craft, their early work was stiff and awkward; but it did not deserve the torrent of abuse which was heaped upon it (even Charles Dickens, who knew nothing about art, attacked it) until Ruskin stepped in and quieted the storm. The Brotherhood lasted only from 1848 to 1851. Rossetti, who had never been a very faithful member, went off to painting women in beautiful clothes and colorful backgrounds. Millais fell away to follow the popular patterns of the day which brought him finally a knighthood and the presidency of the Royal Academy. Holman Hunt remained true to his principles and won gradual recognition, as evidenced by the Order of Merit which he received in his old age. The following pictures are representative: Rossetti, *Ecce Ancilla Domini* (P.R.B.); *Beata Beatrix; Monna Vanna; Veronica Veronese*: Millais, *Christ in the House of his Parents* (P.R.B.); *The Order of Release; My First Sermon; The Yeoman of the Guard*: Holman Hunt, *The Light of the World; The Scapegoat; Triumph of the Innocents; May Morning on Magdalen Tower.* Ford Madox Brown (1821-93), although he was not a member of the Brotherhood, was sympathetic (e.g., *Christ Washing St. Peter's Feet; The Last of England*); and Sir Edward Burne-Jones (1833-98) was the Brotherhood's most prominent follower (e.g., *King Cophetua and the Beggar Maid; The Golden Stairs*).

Whatever eventual effect the pre-Raphaelite movement might have had on English art was broken off by the influence of French Impressionism, which was carried to England and championed by the American born, irascible, James McNeill Whistler (1834-1903). Whistler's emphasis on design as opposed to the story-telling picture of his contemporaries, was sufficiently revolutionary to keep him the storm center of British art throughout his life, a position which because of his personality he must have thoroughly enjoyed. In painting, etching, and lithography he did notable work. In his *Portrait of his Mother* and *Carlyle* he achieved a simplicity and effectiveness of character portrayal which not only transcended but also was in complete harmony with his design. The influence of his study of Japanese art is nowhere better shown than in his paintings and etchings of the Thames (e.g., *Nocturne in Blue and Silver* and *Old Battersea Bridge*). Significant of the new forces which were abroad in the land was the founding of the International Art Society of which Whistler was the first president.

The pre-Raphaelite Brotherhood experienced the life of Jonah's gourd; Whistler, by virtue

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

of his personality, was pretty much a lone wolf; but the reaction against the domination through tradition by the Royal Academy was bound to come. In 1885 the **New English Art Club** was founded to give opportunity for those who found inspiration and validity in Impressionism. It was, however, more than a *Salon des Refusés,* for it had organization and flexibility of point of view, factors which have kept it alive to this day. That it eventually influenced the Royal Academy can be seen in the number of its members who later became Academicians. Of these two at least should be noted: George Clausen (1852—) and John Singer Sargent (1856-1925). In landscape Clausen, under the influence of Bastien Lepage, Millet, and Monet, interpreted the English scene with new design and luminosity (e.g., *Building the Rick* and *The Road: Winter Morning*) and was one of the leaders in revitalizing English landscape painting. Sargent, after his training in France, became a popular painter of portraits in London and in the United States. His work was uneven in that at times his facility ran away with him but often his portrayal of faces showed not only likeness but also penetration of character (e.g., *Asher Wertheimer* and *The Misses Vickers*). Some of his superficiality may be, probably unconsciously, an interpretation of the character of the generation whom he was painting.

The record of English art of the last thirty years is that of other countries; post-impressionism, cubism, and all of the other movements were and are reflected in the work of British artists, and to mention names in this short account would merely give undue prominence to some who are no more worthy than their fellows. These decades are very much alive. The Royal Academy is still the great fortress of British respectability in art but its influence has been greatly diminished. It no longer conducts the only art school; there are many very good ones. Its exhibitions are always attended and carefully criticized; but there are many other exhibitions which are also patronized and studied. English art today is vigorous and many English artists are doing competent work. The days of dependence on foreign artists is long since past and in its place has developed an English art which is in its way an interpretation of the nation. See Baker, C. H. C. and James, M. R. *British Painting,* 1933; Baker, C. H. C. and Constable, W. G., *English Painting, 16th and 17th Centuries,* 1930; Baker, C. H. **entablature.** The superstructure which lies horizontally upon architectural columns or piers; generally of several units.

**entasis** (Gr.). A slight convex curve sometimes given to a column to counteract the appearance of weakness. Seen on the columns of 7th cent. Japanese architecture. —J.A.M.

**entelechy.** See form.

**entr' acte.** See divertissement.

**entrée** (F. *entrer,* to enter or come in). The arrival by groups or individuals of dancers onto the stage, especially in a divertissement (q.v.). —L.K.

**entwining rope style.** See CHINESE ARTS.

**envelope restriction.** See CIVIC PLANNING.

**épi.** *Arch.* A covering for the peak of a sharp-pointed roof.

**epigraphy.** See writing.

**epiphany.** See EARLY CHRISTIAN ART.

**episode.** *Mus.* A digression or incidental passage. See fugue.

**episodic.** Lack of organization with specific reference to plot or story. Here, the term indicates that the various incidents have insufficient internal unity and cohesion; they do not flow into and follow from one another, but are merely a series of unconnected events. There is a lack of logical pattern, and the successive parts of the plot do not seem to demand or influence one another. Hence, though much may happen, nothing develops. —I.J.

**equal temperament.** See ACOUSTICS; interval.

**equilibrium.** A term suggested as an aid in differentiating a balance between *attention-values* from other types of balance (q.v.) found in art. (See Carl Thurston, *The Structure of Art.*) This particular form of balance has grown so indispensable to certain arts that it is important to understand its distinctive structure. A long series of experiments in the laboratory will be needed before this structure can be understood completely but its major outlines seem fairly clear. The forces to be balanced are the attractions which the various units in a composition have for the eye. The attraction which a given unit exercises at any point in the composition will diminish with the distance from that unit but will not be modified by the direction (except in a few special cases which need not be considered here). The sum of the attractions to any unit may accordingly be regarded as constituting a *field,* roughly comparable to the gravitational field surrounding the earth, and any balance that may be created between the attractions exercised by any two units may be most clearly understood by regarding it as a balance between their two fields. It may be assumed, in general, that no balance will be perceived if either (1) the two units are so far apart that a zone exists between them in which their attraction has become so weak that an observer is not conscious of any rivalry between them or (2) they are so close together that the weaker one can no longer compete with the stronger. The possibility of a balance depends on the existence of a point or a zone, at which the attraction of each is felt to be equally strong. But when a pattern or composition contains many units the problem of the artist is not so much the creation of a series of individual balances between them as the merging of all their fields, including those generated by the border or frame if present, into a single field which will appear to be in an agreeable equilibrium. If he is depicting more of the third dimension than is inherent in his medium, as in painting, this imaginary space must also, if possible, be included in the same field. The individual forces involved are extremely slight but as their total value increases, roughly, with the square of the number of units in a composition this total becomes impressive in an art as complex as painting. But what makes it an indispensable ingredient in this art is the infinite flexibility which belongs to it by virtue of its independence of all axes and of the ease with which it can be readjusted by either moving its units, modifying their attractive power, or adding new units, of any desired intensity, wherever they may be needed. It is the only system of space relationships capable of functioning satisfactorily as a complete solvent for all the other ingredients in a highly complex art. It constitutes, to be concrete, the major part of the difference between a Vermeer and a Gerard Dou or a Meissonier. It seems to belong to at least the same aesthetic genus as beauty (q.v.): both create an illusion of simplicity yet are so complex and so elusive that they produce their effects without betraying the secret of how it is done. —C.T.

**equipoised sculpture.** See SCULPTURE.

**escutcheon.** See HERALDRY.

**ESKIMO ART.** By most authorities the Eskimo are thought to have been late comers, probably the last of the Mongoloids to enter North America from Asia. Several thousand years ago they reached Alaska and spread eastward across the treeless tundras that fringe the 6000-mile coastline of the continent from Bering Sea to Greenland. A few turned inland to the forested land up the river valleys and to southwestern Alaska, where, and only where, contact with the Indians was possible. Otherwise they have been a self-contained people and present a relatively homogenous culture pattern evolved by an ingenious people in an inhospitable land. They were hunters and fishers, partly nomadic and partly sedentary, in search of the animals on land and primarily on sea that could furnish them food, fuel, materials for clothing, hunting and fishing equipment, and other artifacts for daily living. In winter many lived in snow houses out on the ice, hunting seal, walrus and whale; in summer they camped in skin tents on the land, seeking land game and fishing in dugouts and kayaks.

A series of epochs has been tentatively established to show the evolution of Eskimo culture. The oldest stage, probably the climax, appears in the **Old Bering Sea culture** found on St. Lawrence and Diomede Islands. It was probably already highly developed in the early Christian centuries. Houses were built of stone, timber and whale bone. Seal, walrus and whale furnished flesh and blubber for food and fuel, skins and membranes for clothing and covering of kayaks, bone and ivory for various artifacts, the shaping and embellishing of which constitute the chief art expression. Besides stone for chipping implements, walrus ivory furnished excellent material for the exploitation of the chief characteristic of their style, linear decoration. Harpoon points, spear heads, skin scrapers and handles of various utilitarian objects were polished to a smooth surface and then engraved with circles or ellipses swung lightly but firmly around a central dot. This linear design produces movement that accents the planes of the object and at the same time an exceptionally delicate surface decoration. The designs are either purely geometric or abstractly representational, depicting the head of a fish or animal where the controlling dot is the eye.

From this Old Bering Sea culture evolved the **Punuk,** whose artifacts are similar. The carving, however, lacks the sensitive delicacy of the former, tends toward the straight line and is cut deeper, probably because of the introduction of iron somewhat before 1000 A.D. Punuk is the transitional stage to modern Eskimo.

In the vicinity of Point Barrow centered the Birnik phase, important chiefly in that it formed the basis of the **Thule** culture which extended eastward from Alaska through Greenland and was based upon seal, walrus and whale hunting. It had much in common with the Old Bering Sea epoch whence it appears to have originated. Its art expression, though similar in kind, is less sophisticated. The Thule culture flourished about a thousand years ago and gave rise to the historic Eskimo in this area.

The Eskimo have adapted themselves most ingeniously to the rigorous climate and limited resources of the far North. They remained isolated from both the Indians and the white men until late in the 19th cent., with the exception of those groups that moved into southwestern Alaska, where they made contact with the Northwest Coast Indians. Here they found an abundant new material, wood, and also metal tools; and from it, with the

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

addition of paint, fur and feathers, produced astonishingly imaginative masks, lively in character, some apparently for pure amusement, but many for a magical purpose, to insure success in the hunt or to appease terrifying evil spirits. Carving from walrus ivory continued on harpoons, throw-sticks, and fishing equipment; but to this utilitarian art was added the engraving and carving of human and animal figures with no particular function. These small carvings are quite abstract in their highly generalized form yet realistic in their characterization.

The Eskimo are skillful in making clothing that is not only suitable to an intensely cold, damp climate but particularly pleasing because of the combinations of furs differing in color and texture, or because of the deftly patterned borders of raincoats made from animal membranes. See Kaj Birket-Smith, *The Eskimos,* 1936; Henry B. Collins, Jr., *Outline of Eskimo Prehistory,* in *Essays in Historical Anthropology of North America,* Smithsonian Miscellaneous Collections, 1940; *Prehistoric Art of the Alaskan Eskimo,* Smithsonian Miscellaneous Collections, 1929; J. A. Mason, *Eskimo Pictorial Art,* University of Pennsylvania, Museum Journal, 1927. —H.G.

**estampie.** See MEDIEVAL MUSIC.

**estipite.** Shaft in the form of an inverted obelisk or herm base which constitutes the main element in the compound shaft of the Mexican churriqueresque order. It is regularly surmounted by a square block with round medallions and a Corinthianesque foliate capital. —J.Mc.

**Estonia, art of.** Estonian art well reflects the history of the country and the long periods of foreign domination. The original Estonians, a Finnic speaking race, were conquered by the Danes in the 13th cent. and King Waldemar of Denmark erected the castle of Tallinn. The country finally passed under the control of the Knights of the Sword and later the Teutonic Knights until its union with Sweden in 1561. Then in 1710 Russia, which had repeatedly invaded the country, captured it and held it until the Soviet Revolution. During the confusion of World War I, the Estonians recovered their independence and were recognized by the other nations.

There are a few remains of the Stone Age and of the Iron Age but the bulk of the peasant art dates from the 18th cent Like the other nations of Eastern Europe, wood was the most favorite medium for decoration with floral motifs in the north and geometric in the south. Woolen and linen weavings show the same type of design. Metal work is relatively rare, although there are considerable numbers of silver articles.

The medieval architecture, esp. in Tallinn, consists of churches and castles in Baltic Gothic. Among these may be mentioned the Bishop's Church (ca. 1223), the Gothic City Hall of the 14th cent. and the towers of the various ramparts as the Fat Margaret, the Kik in de Kök and many others. Nearby in Pirita is the Church of St. Brigitta which was destroyed by the Russians in 1577 and has since been excavated and restored.

There are a few Renaissance buildings as the House of the Black Heads in Tallinn and in the 17th cent. there were many baroque monuments, esp. in Narva. Later, under Russian influence there was an extensive development of the classical tradition so favored by Peter the Great and his successors. We may mention many of the buildings in Tartu and the Kadriorg or palace of Peter near Tallinn.

During the 19th cent., the modern buildings show the conventional European influences and since the liberation of the country there has been a definite influence of some of the Finnish architects.

In the field of painting, there exist some religious frescos from the medieval period but there is little of value until the 19th cent. when K. A. Senff (1770-1838), a German, became professor of art at the University of Tartu. Yet, during the century the influence of the Imperial Russian Academy of Arts was very prominent and J. Köler (1826-1899) was the first Estonian to be elected to membership in it. He was a portraitist and landscape painter influenced, to a certain degree, by French realism. Later through the influence of Hoffmann (1851-1912) and K. F. E. von Gerhardt (1838-1925) the Düsseldorf Academy exerted considerable influence upon the younger painters. Konrad Mägi (1878-1925) introduced French post-impressionistic traditions; since his time practically all schools of painting have made their appearance.

Since the independence of the country, the Pallas School of Arts at Tartu has been the chief influence in the country. There has been a return to realism among some of the most prominent artists as A. Johani (b. 1906) but this has not excluded the development of artists who have been influenced by German expressionism, French monumental art, cubism and abstract geometric art.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

Sculpture has been less developed but August Weizenberg (1837-1921) was trained in the Imperial Russian Academy and such men as Jaan Koort (b. 1883), the greatest of Estonian sculptors, has been influenced by Egyptian and various primitive techniques.

The sober realism of the Estonian character has left its effect upon the art of the country; and since the period of liberation this has been taking the foremost place in the artistic production. Yet this has not meant the elimination of foreign influences but rather the welding of them into the formation of a national style which is still not in final shape. See *Estonia: Population, Cultural and Economic Life,* ed., Albert Pullerits, Tallinn, 1938.

—C.A.M.

**estufa** (Sp. stove). (1) Term applied to the chamber used as a "sweat house" by various Indians. (2) Term sometimes applied to the chamber that is better known as the "kiva" in southwestern archeology. —J.M.M.

**étagère** (F.). An open-shelved cabinet.

**etched glass.** See GLASS AND GLASS MAKING.

**etching** (from the Dutch, *etzen,* to eat). Denotes an eating away process, using acid for this purpose. In print making, includes not only bitten plates but also proofs from these plates. The term, used in a general way, covers the following intaglio processes: line etching, aquatint soft ground, pen process aquatint, stylotint ( q.v.), and other types of bitten graphic work. See PRINTS AND PRINT PROCESSES. —K.K.

**etching line.** This is what is usually meant by the term, etching, used in a restricted sense. Line etchings are entirely made up of lines, some bitten deep, some very delicate, sometimes single lines, sometimes cross hatched many times. The paper and ink molded in the tiny etched channels of the plate gives a rich raised line. The delicate film of ink on the surface of the plate, controlled by the printer, can focus light on an appropriate section of the plate, giving a sustaining tone to the darker passages. It is the most widely used and renowned of the intaglio printing processes, used by the world's most famous artists. See PRINTS AND PRINT PROCESSES. —K.K.

**etching needle.** Steel point used for making the drawing on a grounded plate for a line etching.

**etching paper.** Specially made paper, soft, and with a minimum of sizing, for printing etchings.

**etching press.** Printing press for pulling proofs or impressions on paper from intaglio designs on metal plates.

**etching, soft ground** (*vernis mou*). A type of etching that has a soft broken line resembling a pencil or crayon line. It does not have the decisive quality or control that characterizes line etching, but it does have a pleasing line well suited for masses, textures and use in conjunction with aquatint. See PRINTS AND PRINT PROCESSES. —K.K.

**etchuseto yaki** (Jap.). Pottery made in Etchu province.

**Etruria ware.** See CERAMICS II.

**ETRUSCAN ART.** Etruscan civilization (ca. 700-100 B.C.) centered in Tuscany on the west coast of Italy. The Etruscans, seafaring invaders from the eastern Mediterranean, were for three centuries the leading political power of Italy (8th-6th cent. B.C.). Later (400-100 B.C.) they succumbed to the attacks of the Gauls and the Romans. Early Etruscan architecture is represented by tombs, some rock-cut and others built of masonry (Regolini-Galassi, Caere; Pietrera, Vetulonia; Populonia). The accent is on the masses of the walls; narrow and intimate spaces are hollowed into the big mounds. The decorative vocabulary of the minor arts combines central European (Hallstatt) and orientalizing traits. Adorned with images of oriental gods and monsters in exquisite granulation, the superb Etruscan jewelry derives its effects from a rhythmic alternation of light and shade on the gleaming metal.

Greek influence becomes paramount in the later 7th cent. B.C. and henceforth dominates all forms of Etruscan art. The Etruscan temples derive their tripartite cella from a Mediterranean prototype. Their division into a roofed porch and a broad cella results from exigencies of the Etruscan cult. Their use of columns and architectural decoration is based on archaic Greek models. The best examples of wooden temples revetted with polychrome terra cottas date from the archaic period (600-450 B.C.). This period abounds in large terra cotta images and in funeral statues and funeral reliefs in native sandstone (Veii, Caere, Met. Mus., N. Y.) (Chiusi, Tarquinia, Fiesole). The reliefs depict battle

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

scenes, funeral games, banquets, and religious ceremonies; similar subjects are shown in the vivid paintings of the tombs.

Etruscan work lack the disciplined order, the logic, the tectonic poise of their Greek models. They exhibit broad, voluminous forms covered with flat colors and express an unbridled, animalistic spirit.

The classical art of Greece (5th and 4th cent. B.C.) was imitated by the Etruscans with indifferent results. In architecture some of the decorative motifs change following their Greek models and sculptured groups are introduced into the pediments (Orvieto). In sculpture, the mechanics of anatomy are gradually grasped with no perception of their organic unity. And the exuberance of Etruscan archaism is replaced by vacuous passivity (terra cotta head, Chiusi; bronze statue of Mars from Todi).

The revival of Etruscan art in the 2nd and 3rd cent. B.C. forms part of the rise of provincial Hellenism in Italy, an art often lax and barbarized but vigorous and rich in experiments. In architecture, arcuated forms developed by the Greeks stimulate the Etruscans to new achievements in arched and vaulted structures (barrel-vaulted tombs and cisterns in Chiusi, city gates of Volterra and Perugia). In sculpture, the dynamic style of the Hellenistic school of Pergamon is reflected in the excited, loosely modelled reliefs of Etruscan urns and, on a larger scale, in the terra cotta sculptures of temple pediments (Civit'Alba, Telamon, Vetulonia). Hellenistic interest in the individual is echoed in Tuscany by a series of magnificent portraits. Some are pensive and introspective (bronze boy, Florence); some are overladen with realistic detail to the point of caricature. Others portray an aggressive spirit with a few incisive traits. But all of these portraits are concerned with the emotional rather than the intellectual or spiritual aspect of man. In painting, Greek Hellenistic prototypes of sculptural forms and richly graded palette are reduced to flat outline drawings with strong contours and a few expressive accents. (Tomb of Typhon, Tomb of Cardinal, Tarquinia). The last Etruscan monuments (after 100 B.C.), represented by small Etruscan urns in Perugia, can scarcely be distinguished from the poorer products of the art of the Roman Republic.

The Etruscans have not contributed any new significant visual forms to the history of art and too little is known about the function of art within the framework of Etruscan culture to give a true historic interpretation. Yet in the best Etruscan painting and sculpture, technical competence combines with a rich decorative pattern, strong colors and voluminous masses to express convincingly a passionate vitality which strongly appeals to many modern critics. See G. M. A. Richter, *Handb. Etruscan Coll., Met. Mus., N. Y.*, 1940; E. G. Giglioli, *L'arte etrusca*, 1935; P. Ducati, *Storia dell'arte etrusca*, 2 vols., 1928; *Etruscan Sculpture* (Phaidon), 1940.

**Etruscan pottery.** See CERAMICS II.

**etude.** *Mus.* A lesson designed to afford practice in some special difficulty; occasionally used as name for artistic compositions (Chopin).

**euouae.** A formula or abbreviation found in chant books for the last two words, *saeculorum amen* of the *Gloria Patri* or lesser doxology. The abbreviation is made up of the last six vowels. —V.A.

**euphony.** An agreeable combination of sounds or tones.

**Evangeliar** (L., *evangeliarium*). It contains the four Gospels in unabridged form. At the beginning of the medieval Evangeliars there was usually the introductory letter which St. Jerome, the translator and redactor of the Vulgata, wrote to Pope Damasus who had ordered the translation. The Evangeliars have become of great artistic importance because of the habit of ornamenting letters and illustrating the texts. They contain the oldest extant examples of Teutonic culture in the form of painting. Famous Evangeliars include the following: SCHOOL OF IRELAND: *The Book of Kells*, beginning of the 8th cent., Trinity College Library, Dublin; *Evangeliar from Lindisfarne*, beginning of the 8th cent., London British Museum; *Evangeliar from the St. Gallen Monastary*, library No. 51, about 750 to 780. SCHOOL OF ENGLAND: *Cuthbert Evangeliar*, 770 to 780, Vienna, Hofbibliothek; *Evangeliar of the School of Canterbury*, about 785, London British Museum; *Evangeliar of Cambridge*, beginning of 11th cent. FRANKISH SCHOOL: *Godescalc Evangeliar*, about 800, Paris and London; *Evangeliar Grandval*, School of Tours, 834 to 843; *Evangeliar of Charles the Bald*, Franko-Saxon, after 865; *Codex Aureus of St. Emmeram*, School of Corby, 870. GERMAN SCHOOLS: *Evangeliar of Otto III*, School of Reichenau, about 1000, now in Munich; *Evangeliar of the Abbess Uta of Niedermuenster*, School of Regensburg, 1002-

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

1025; *Bernward Evangeliar,* School of Hildesheim, 993-1022; *The Golden Evangeliar of Henry III,* School of Echternach, 1045, now in the Escorial. See literature under miniature and initial —A.J.S.

**Evangelistary, the.** Contains the Gospel texts of the *Missale Romanum.* These texts are distributed through the whole of the Church year in accordance with that which is read each Sunday. They are artistically important because of their ornamented letters and illustrations. Famous old Evangelistaries are among others: Evangelistary in Oxford, Bodleian Library, north east Frankish, about 800; Evangelistary at Leipzig, Stadtbibliothek, School of Reichenau, group of Eburnant, third quarter of the 10th cent.; *Gero Codex* (Evangelistary) Darmstadt, Hessische Landesbibliothek, Cod. 1948, School of Reichenau, Eburnant-group, third quarter of the 10th cent. See literature under miniature and initial —A.J.S.

**Everett Orgatron.** See electrical instruments.

**ewer.** A wide-mouthed pitcher or jug with extended lip for pouring liquids.

**exact seeing.** See PHOTOGRAPHY.

**excess condemnation.** See CIVIC PLANNING.

**execution.** See design.

**exedra** (Gr. *exedra* fr. *ex,* out+*hedra,* seat). An open recess, semi-circular or rectangular, provided with a bench around the wall, opening off the colonnade in Greek gymnasia or private houses, or free standing in sanctuaries; for conversation. —L.T.S.

**exhibition.** In museum terminology the word "exhibition" means a temporary display of art objects based on a central theme. Many museums arrange a varied program of exhibitions which change every month. In a broader sense "exhibition" is used to refer to the display of objects in an art museum's permanent collection. Art exhibitions are also held in schools, colleges, galleries of art dealers, clubs, theatres, stores, and other public institutions.

Not only is the temporary exhibit important for enjoyment and educational value, but it also serves to lead visitors elsewhere in the museum and into other museum activities. The importance of temporary exhibitions has been recognized by museums in recent years as a means for stimulating and maintaining interest in the museum and for keeping it a living institution. Often the temporary exhibition is used as the focus for lectures, seminars, movies, and as an integral part of the museum's educational program.

**Loan exhibitions** consist of objects borrowed from private and public collections and from art dealers. These are often supplemented by objects from the museum's own collection which are adapted to the idea of the exhibition. **Circulating exhibitions** are assembled or constructed by an institution and rented or lent to museums and schools. The materials of circulating exhibitions are sometimes mounted on panels to facilitate transportation. These are often **educational exhibitions,** which include both original works of art and explanatory material: photographs, diagrams, and models. The **permanent collection** of a museum includes all the works of art it owns. In displaying its objects according to periods and countries, a museum often makes them into organized exhibitions.

Although the subjects of exhibitions are infinite, specific types of subject matter can be listed. The most common subjects are the art of a single country, period, or type of art (painting, sculpture, architecture, prints, furniture, etc.). The "one man show" of the work of a single artist, living or dead, is a common theme. Other subjects include types of subject matter (portraits, landscapes, the Christmas story, fashion in art, etc.). After the idea of an exhibition has been developed, a good title is important, just as for a play or book.

The arranging of exhibitions is an art in itself. Even the simplest exhibit of paintings in a single room requires care and thought in its display. A symmetrically balanced arrangement is usually made in a case of this kind. Large pictures are located in the centers of walls, as centers of interest and balance, with smaller pictures of equal size on either side. On each side of the central group an alternation of picture sizes and shapes is then made. Two small pictures may be double hung to form a group equivalent to a large picture. Sometimes pictures must be balanced with respect to the direction of their internal lines. In this connection, paintings in the corners of rooms should never face the corner (e.g., a profile portrait facing a corner). In general, pictures are hung at eye level with equal distances between them. The aim, of course, is to make as interesting a wall as possible, for a wall arrangement can easily be monotonous.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

In contrast to exhibitions with balanced arrangement are exhibits which are intended to be started at the beginning and read through to the end. By their nature exhibitions of this kind are educational. The primary consideration in the arrangement of such an exhibition is to induce the observer to follow the material in logical sequence. This requires not only signs and arrows to point out the starting place and continuity, but also an arrangement of objects so that one will lead to another. In the informal sequence type of exhibition, there is usually more grouping of objects than in the formal balanced type. Often objects are arranged on the diagonal and in unsymmetrical balance. Sometimes a unifying horizontal background is used in the form of a band of colored paper, cloth, or wood extending around the room on which the objects are arranged. To make the observer look at objects in the proper sequence, many museums form corridors by erecting partitions. Corridors and an informal arrangement are also used in exhibitions which do not have a strict sequence or educational aim. The arrangement of an exhibition develops as the logical result of the material.

An important principle in exhibition arrangement is clarity, both in layout and in labeling, so that unanswered questions do not distract the observer. In some cases explanation is not included in labels or signs but in a catalogue or gallery book. The arrangers of exhibitions have learned much from advertising art, the theatre, and store window display. Among the properties used are different types of pedestals, backgrounds, shelves, moving diagrams, wall movies, and spotlights.

In planning an exhibition every aspect is important from beginning to end, from the original idea to the publicity, opening reception, and museum program based on the exhibition. Although to the observer the finished exhibition should have the appearance of being an almost effortless undertaking, it is the work and thought which have gone into every phase that make it a success.

—D.T.

**exile melodies.** See JEWISH MUSIC.

**ex libris.** The international term for **bookplate,** a decorative name label placed (usually) on the inside cover of a book to indicate ownership. Its history parallels closely the history of printing, the earliest known plate dating back to 1450. Albrecht Dürer engraved a number in the early 1500's as did Altdorfer, Cranach and other artists contemporary with him. The earliest dated English plate yet found is of 1520. These early plates were nearly all armorial, many of them with the coat of arms only, as everyone could read the armorial bearings even if unable to read the name. The first plate printed in America was the typographical label of Steven Day, dated 1642.

All art museums and most libraries have collections of bookplates mounted and classified. Classification according to style is important in the description of plates, as "plain armorial", "Jacobean", "Chippendale", "ribbon and wreath", "urn" (which had a vogue after the publication of Gray's *Elegy*), "pictorial", "armorial-pictorial", "bookpile", "portrait", "canting", "erotic", "humorous", "juvenile", "typographic". Plates are distinguished again according to the method of reproduction. The earlier plates were all engraved on copper and this is still considered to be the finest and most formal method, but unfortunately there are very few artist-engravers now living. Etching on copper is a popular medium, particularly for pictorial plates and some of the great contemporary etchers have made beautiful bookplates. Wood engraving is a fine medium for creative expression and the many striking plates by Rockwell Kent are the best modern wood-block examples. Lithography and photogravure are both used successfully in the reproduction of bookplates, but the half-tone process is ineffective. In point of numbers more plates are made as zinc etchings from pen drawings than are produced by all other methods combined. The cheapness of the process makes it popular rather than exclusive and the success of the plate all depends upon the artistry of the original drawing.

Collectors classify plates under different subject heads and specialize in their collecting under one or more divisions. Some collect only Early American, others famous personages, others Masonic or medical or angling or dramatic plates. Some collect authors, others music markers. Many collect only the work gardens, ships, skulls, canting plates, juveniles, of one or two noted artists such as Sherborn, Eve, Spencely, E. D. French, Sidney Smith or Macdonald.

A bookplate is first of all a name plate to denote ownership and prevent loss. It is a design with the owner's name and, to make it individual, some pictorial indication of his profession or hobby or ambition or favorite recreation, but ideally it should be more than

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

this, it should be a composition to be enjoyed for the intellectual pleasure it gives from its organized pattern of form and line, a design whose elements are the name and individual symbolism of the owner but which are used as means to the end of creating a complete and satisfying piece of art. A bookplate is a little thing, two inches by three, more or less, but it *can* be a distinct work of art. It is like a sonnet in literature, complete and self-contained. A long list of the world's great artists who have made bookplates could be compiled, from Dürer, Holbein, Hogarth, Bartalozzi, Millais, Abbey, down to Brangwyn, Cameron, Heintzelman and Kent of the present day, all of the plates containing that indefinable quality that makes true art. It must be admitted, however, that the majority of bookplates now in use do not reach that height, and it might be said incidentally that most amateur designs fail because of poor lettering. See Allen, *American Bookplates;* Fowler, *Bookplates for Beginners;* Doane, *About Collecting Bookplates;* Ward, *Some American College Bookplates;* Fuller, *A Bibliography of Bookplate Literature.*

**experience of beauty.** See PSYCHOLOGY OF ART.

**experimental aesthetics.** See AESTHETIC INQUIRY, CURRENT TYPES OF.

**experimental productions.** See RADIO DRAMA.

**EXPERIMENTAL PSYCHOLOGY OF MUSIC.** Viewed comprehensively, the experimental psychology of music is based on pure psychology, general aesthetics, physics, particularly acoustics, anthropology, ethnology, genetics, and in the case of vocal music, phonetics and linguistics. Pure psychology and aesthetics present the general problems and hypotheses, while the other sciences furnish methods of research, apparatus and techniques, and an adequate variety of material in space and time.

The beginnings of such an experimental science appear in the work of the Pythagoreans on the relation between musical tones and the length and tension of vibrating strings, and in empirical observations on the influence of different musical modes on the individual and society recorded by Plato and other Greek authors; but the experimental approach remained undeveloped through the decline and eclipse of science during the later classical and medieval periods.

Beginning with the Renaissance, the rapid development of experimental physics, physiology and anatomy, including many researches on acoustics and studies of the auditory apparatus, prepared the way for the first comprehensive treatment of the conditions and laws of musical sensitivity presented by Helmholz in his classic on musical sensations (*Tonempfindungen,* 1863). In this work, mathematical analyses of sound waves, physical attributes of sound, sensory properties of tones and tone complexes, and a detailed account of the structures and functions of the ear are brought into fruitful contact and given a systematic interpretation.

The contribution of Helmholz may be appreciated when it is realized that "every phase of vocal or instrumental music, artistic or inartistic, every emotional touch as actually expressed and conveyed by the musician can be represented in the four attributes of the sound wave; namely, the frequency, the amplitude, the duration and the wave form." (Seashore). In short, all music is a matter of sound waves, which may be photographed and of sensory receptors and effectors which may be studied in detail.

Helmholz confined his attention to musical sensations, formulating theories of tonal fusion and consonance based on an experimental study of "beats." Rival theories of consonance and dissonance, also based on experiment, were presented by Stumpf, Lipps and Külpe, and fruitful experimental studies of melody and harmony have also grown out of Helmholz's work.

Other psychologists applied the experimental method to musical ideation and affective processes. The result is a general agreement that **musical imagery** is never specific and that musical synaesthesias are variable products of individual experience.

On the other hand, emotional responses to music appear to be well established. Bingham has shown the presence of constant **mood effects** in response to specific musical patterns and the traditional correlation of gay and melancholy responses with major and minor modes, receives considerable support. The modification of physiological functions and bodily reflexes involved in emotion, and even in the absence of an affective state, is marked. As to motor and physiological responses there appears to be general agreement that music increases metabolism in man and higher animals, increases or decreases energy according to type of music, accelerates rate and decreases regularity of respiration, produces marked

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

but fluctuating effects on blood circulation, is reflected in the psychogalvanic reflex, and reduces sensory thresholds in several sensory modes.

Types of musical experience as a whole have also been studied experimentally, and several useful classifications of musical listeners have been presented. Among these are Gurney's indefinite and definite listeners, Ortman's genetic classification into sensorial, perceptual and imaginal types, and Myers' division of musical auditors into intra-subjective, associative, objective and character types according to their tendency to regard music as an end in itself, or on the other hand, to read into it experiences of a personal or subjective nature.

The existence of different types of listener points to differing degrees of musical receptivity and capacity for production, and suggests that aesthetic response to music as such is a definite function which Schoen terms "form-mindedness." This must be defined in terms of acquired and inherited sensitivity to the principal aspects of musical form, viz: pitch, intensity, duration, timbre, consonance and rhythm,—all available for experimental study.

Recognition of this inaugurated the third phase in the development of an experimental psychology of music,—viz: an applied psychology, seeking the definite limits of heredity and acquisition, the order and sequence of musical development as revealed by comparative ethnology and child psychology, and reliable tests of musical aptitude as a whole and musical abilities in detail. The **applied psychology of music** is likewise concerned with tests, measures, and relevant methods of investigating musical performance, production or creation.

Professor Seashore of Iowa may be regarded as the great pioneer and principal founder of an applied psychology of music on an experimental basis. Several unstandardized and four standardized tests for musical capacities exist. Of the standardized tests by Seashore, Schoen, Kwalwasser-Dykerma and Ortmann, those of Seashore are best known and the most widely used. Seashore presents tests of pitch intensity, time memory, consonance, and rhythm.

Seashore and his pupils have also evolved exact experimental techniques and apparatus for recording the finer unconscious variations in the vocal performances of singers. This work, as it involves similar equipment and techniques, establishes connection with the psychology of phonetics and speech. Seashore's studies of the vibrato (q.v.) mark a fruitful extension of the experimental psychology of music.

Experimental studies of the development of musical sensitivity in young children and primitives suggest that both are comparatively indifferent to consonance and dissonance, but civilized children develop the tastes of adults at the age of twelve or thirteen, while primitives remain retarded in this direction. In this connection the comparative phonographic researches of Von Hornbostel, and of members of the Bureau of American Ethnology have supplied invaluable data. Attempts to study the inheritance of musical ability by statistical studies of families of musicians, and intensive tests of musical prodigies have yielded no definite conclusions respecting the inheritance of musical talent as a whole, but suggest that certain specific capacities may be inherited.

On the whole the experimental psychology of music has resulted in a solid contribution, useful to the theorist, teacher, musical performers, and composers, as well as to all concerned with what we might call the economic utilization of the musical resources of society. See Schoen, *The Psychology of Music,* 1940, (best single reference); Helmholtz, *Tonempfindungen,* 1863, Eng. trans., *Sensations of Tone,* 1912; Stumpf, *Tonpsychologie,* 1883; Seashore, *The Psychology of Musical Talent,* 1919 and The University of Iowa Studies in the Psychology of Music, 1932-1937; Diserens, *The Influence of Music on Behavior,* 1926; *Schoen, The Effects of Music,* 1927; Diserens and Fine, *A Psychology of Music,* 1939. —C.M.D.

**exposition.** *Mus.* (1) The first section of a fugue. (2) The section before the double bar in a sonata's (q.v.) first movement. See fugue.

**exposition, expository composition** (L. *expositio*). A mode of composition (q.v.) in art, in which details are arranged in such a way as to set forth, explain or suggest general relationships, as of casual or logical connection, abstract meanings, pervasive qualities, common or underlying principles. It is most fully and clearly developed in scientific and literary discourse, as in the essay; but occurs also as a factor in other arts. Religious painting and sculpture often contain a strongly expository factor, in the setting forth of doctrines about the nature of divinity, the universe, morality, etc., often suggested in a vague or cryptic way through mystic symbols. Exposition may coexist with decoration, representation, and

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

utility as a factor in the total form of a work of art. —T.M.

**express highway.** See CIVIC PLANNING.

**expression.** A process through which something hidden and diffused is concentrated and brought out into the light (for instance the squeezing out of the juice from the fruit). The twofold movement from diffusion to concentration, and from inside to outside is retained in the aesthetic employment of the term. There is also retained, to a certain extent at least, the idea that the juice squeezed out is the essential part of the fruit—*sugo,* juice, is in Italian also the colloquial term for essence—whereas the remainder, such as seed, shell, etc., can be disposed of.

In art the term expression used to be employed exclusively for a relation taking place in the subject matter itself, the relation between the visible or audible movements of a body and the state of mind of the owner of the body. A painting, for instance, was said to be expressive if the movements and physiognomies of the persons represented left no doubt as to the state of mind of these persons. A state of mind, diffuse by nature and hidden to our eyes, is concentrated and made visible in the movements of the face and body (gestures). Thus the essence, the "idea" of that state of mind gains visibility, while the accidental is left out. In this objective sense of the term Raphael was thought by the classicists to be the greatest, i.e., the most expressive of all artists.

Today such a judgment would seem almost incomprehensible. Many call Raphael expressionless because instead of acquainting us with the passions of his soul he projects by some magic other people's emotions into the realm of beautiful gestures. Our subjectivistic age prefers the direct expression of the artist's interesting soul. With increasing emphasis on the subjective side of art, expression has been losing more and more the function of concentrating the diffused and separating the essential from the accidental. To express is still to bring to light what is hidden; but in the heyday of expressionism, anything in the artist's soul was considered worthy of being expressed, and artistic productivity had come to mean obedience of pen and brush to chance associations in the artist's mind, chance associations which are his private affair and quite incomprehensible to anybody else.

Between objectivism and extreme subjectivism stands Croce's famous theory of art as intuition. To be sure, it is the artist's state of mind that is being expressed. Yet it is being expressed not directly, explosively, catastrophically, but indirectly, through an image, in which the artist's state of mind finds fulfillment and satisfaction. The union of the state of mind with this image Croce calls the aesthetic synthesis *a priori.* The image, repleted with the artist's soul, is, in turn, being translated into the terms of the artistic medium. This translation is the function of the artistic technique. The decisive artistic stage is, then, what might be called the conception of the artistic idea, the moment when a state of mind seems to find its full expression in a sequence of sounds, called melody, or a combination of colors and shapes. The elaboration of this initial conception, of the melodies into a symphony, of the pattern of colors and shapes into a painting, would be a matter of mere technique, and artistically much less relevant.

Dewey, however, recognizes the intrinsically artistic function of what to Croce is the mere translation of the original conception into terms of the artistic medium. The resistance offered by the medium causes the artist's emotion to reflect upon itself and thus raises expression from a mere outcry to a poem. On the other hand, Dewey identifies the act of expression and the expressive object. To him every experience is aesthetic which is consummate—as if an object were a work of art because our experience of it (both creative and recreative) is consummate.

When the expression aesthetics was at its height, understanding of the term expression was at its lowest. It contained various ingredients that remained undistinguished. There is, first, the formal concept of expression according to which anything present to our senses may signify something absent to them. Behind this formal concept of expression are hidden three relations which are hopelessly confused by indiscriminately calling them all "expression". We may call them discharge, expression proper, and sedimentation. All three view expression from the perspective of the expressing agent, whereas the formal concept of expression is drawn from the perspective of the onlooker. **Discharge** may be defined as a direct expression, translating an emotion into motion, with no intervening judgment of taste, morale, reason. **Expression proper** is the deliberate objectification of a state of mind in an image—this is Croce's aesthetic synthesis

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

*a priori*. **Sedimentation**, perhaps the most enigmatic of these processes, is the way in which unconscious evaluations that make up much of the artist's individual, racial, social, cultural character, become unintentionally perceptible in the work of art.

The metaphysical phase of the problem of expression is part of the traditional mind-body problem—an observation that cannot here be elaborated. For the historical relativism implied by the expression aesthetics see style.

—W.C.

**expression** in dance refers to the quality of its movements being indicative of feeling, mood, or character. Vividness of expression depends upon the strength of emotional tone which in turn depends upon the clarity and strength of the image (the mental state) to be expressed. The wealth of image recall is dependent upon the richness of imaginal materials of the mind and not upon the will to be "expressive". When the final image is clearly and vividly sensed, it demands release. It expels itself from the mind over the motor paths and finds expression in movement. If the emphasis is on the dancer's personal way of experiencing and reacting to the mental state seeking expression, the dance tends toward "self-expression." But if the emphasis is on the interpretation of content in relation to other selves, the dance becomes less personal and more universal. A dance, of course, must be an individual thing, but not a personal thing. A dancer must have the capacity of expressing and arousing human emotions without appearing to share them personally. His audience should feel with him—not for him.

—M.N.H.'D.

**expressionism.** One of several currents of post-impressionistic art, but also the whole post-impressionistic period itself, including abstactionism, cubism, etc.

The common denominator of all post-impressionistic art is negative: Expressionism is non-imitative. What, then, is being painted? The various answers to this question indicate the several trends of post-impressionism.

*I. Subjective Expressionism.* (a) The artist paints his emotions, or rather his emotions do the painting. Hand and brush form the immediate, automatic outlet for his moods and feelings. (The early Kandinsky; many minor German and Russian artists.) (b) He paints his associations or arbitrary symbols of such (Klee, Kandinsky, some of Marin). The resemblance of this art to the creations of schizophrenics has often been observed (cf. Oskar Pfister, *Expressionism in Art*, London, 1922). (c) He paints his representational images. (Matisse, Picasso, some of Marc).

*II. Objective Expressionism.* The artist paints the expressive character of the object. Instead of painting a tree, he paints its convulsiveness or its strength. Sincerity becomes the main aesthetic category. (Rouault, Nolde, Hofer, Beckmann, Kokoschka. In sculpture: Barlach, Zadkine, Epstein, Lehmbruck).

*III. Abstractionism* (q.v. abstraction). (a) The artist paints wholly abstract compositions of colors and forms (Picasso, Braque, Kandinsky. In sculpture: Archipenko). (b) Decorative patterns, mostly planear. (Matisse: ". . . expression for me . . . is in the whole disposition of my picture" Walden: "Painting is the art of the plane" (c) The stereometric or geometric essence of some object, varying this motif according to aesthetic laws. This is Cubism (Picasso, Bracque, Feininger. In sculpture: Brancusi, Archipenko, Zadkine.)

*IV. Magic Realism and Surrealism,* usually classed with the post-expressionistic movements (q.v. surrealism).

These currents are derived from the four great masters who were the first to move beyond impressionism, viz., Cézanne (1839-1906), Odillon Rédon (1842-1916), Gauguin (1848-1903) and Vincent van Gogh (1853-1890). (Seurat also is nowadays counted among the direct progenitors of post-impressionism). The decorative tendencies of post-impressionism originate with Gauguin, whose planear decorativeness is plastic without being spatial; the cubistic ones with Cézanne who builds his cuboid forms and spaces out of densely interlocking color planes. The objective expressionists see their great precursor in van Gogh, who changed the things painted more and more into symbols of expressiveness; the magic realists and surrealists in Rédon. These trends now join forces, now remain separate and distinct.

The meaning of expressionism has been conceived differently by French and German artists and art-writers. To the Germans, expressionism meant above all a revolution from the 'superficial', 'technical' art of impressionism to a style directly expressive of the artist's soul in all its hidden depth and with as little interference as possible from formal and compositional elements. Here we have a revolution against Renaissance this—worldliness with its culmination in impressionism (Hermann Bahr, Paul Fechter).

In France, however, according to the particular genius of this nation, the formal and

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

truly artistic problems have dominated the scene. The emotional eruption was left to the Eastern barbarians. While there are no intermediaries between German impressionism and German expressionism, a definite artistic continuity can be pointed out in the development from French impressionism to French expressionism (for example Monet's murals in the Musée du Jeu de Psaume anticipate Matisse's planear decorative patterns), where in spite of all savagerie (Les Fauves) good taste, elegance and workmanship prevail.

Herwarth Walden was one of the very few German expressionists who, like the French Appolinaire and Gleizes, laid less emphasis on soul and metaphysics than on the formal structure of the work of art. The "painting is an organism the parts of which are composed by colored forms", the idea being that what music does with sounds, painting should do with colors and forms, in abstraction both from subject matter and from the artist's soul.

Post-impressionism's real contribution to the history of art lies in its emphasis on pure form and structural integrity—an assertion corroborated by the fact that cubism alone of all the post-impressionistic movements has been able to express itself in the medium of architecture, there creating a new and truly great style (Le Corbusier, Gropius and das Bauhaus, Lescaze, Neutra, some buildings of Frank Lloyd Wright, etc.). See FRENCH ART. —W.C.

**Expressionismus** (Ger). The collective name usually given to the various movements of modern German art (with the exception of *Neue Sachlichkeit,* q.v. new objectivism). For the development of German expressionism two dates are of importance: 1903—the founding of the first modern artists' group, *Die Brücke,* (The Bridge) at Dresden by E. Heckel, Max Pechstein, Emil Nolde, E. L. Kirchner, K. Schmidt-Rottluff, and 1911—the organization of the artists' group, *Der Blaue Reiter,* (The Blue Horseman) at Munich by Paul Klee, Franz Marc and Vasily Kandinsky, later joined by Jawlensky and M. Chagall. ("The Blue Horseman" grew out of the *Neue Künstlervereinigung München* of which Kandinsky was one of the leaders.)

In its beginning German expressionism was greatly influenced by the art of Gauguin, van Gogh, and Edvard Munch, and by the French moderns. The difference between the German modernists and their French contemporaries might be seen in the greater individual variety and the greater radicalism in the deformation and distortion of natural forms by the German artists. The expressionists however, do not aim for purely aesthetic-artistic creations: the accent lies (according to their declared aims) on the "expression of the innermost soul", the "thing as such", etc.

Emil Nolde's interpretations of biblical scenes, Schmidt-Rottluff's figures and portraits, Max Pechstein's South-Sea idols (and one might add the names of Macke, Nauen, Kirchner, Heckel, Otto Müller) are violent distortions of forms found in nature, painted in bright, strong and often sharply contrasting colours. These pictures owe their strength and violence to a great extent to the fact that the natural shapes and forms are not sacrificed altogether to the artistic effect but that there remains just enough recognizable similarity to make the change appear as a radical if not brutal deformation. More concerned with artistic form, but justifying it by means of metaphysical considerations, are the pictures of Franz Marc, who in his letters explains that he turned to painting animals because he found them purer than men, who were ugly, and that he tries to make nature transparent for the clear line of "pure expression". The Austrian Kokoschka's early pictures show similarities to the above mentioned group (e.g. *Woman with Parrot,* 1915); in his later paintings his colors have become lighter and there is less distortion in his paintings (e.g. *Port of Dover,* 1926). Lyonel Feininger (American born) transforms natural forms, especially buildings and streets, into crystal-like shapes which are arranged with geometrical precision into quite unreal perspectives.

Willy Baumeister and Oskar Schlemmer construct their compositions of figures and objects in a manner reminiscent of F. Léger. While Baumeister builds up his forms with clear contours, often using color as a modeling shadow, Schlemmer uses color for the construction of the figures, gaining three-dimensional effects through shading and color transitions. J. Molzahn paints bent and curved geometrical shapes (e.g. *Flowering Chalice,* 1920), in rich and glowing colors. Campendonk's treatment of colors is similar to that of Molzahn, but his treatment of the shapes of men, animals or plants shows the influence of Marc Chagall (e.g. *The White Tree,* 1925).

The most consistent of the expressionists are Vasily Kandinsky and Paul Klee. Kandinsky, a Russian (born 1861, living in Germany 1897-1914 and 1922-1933), who must be mentioned here because through his paint-

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

ing, writing and teaching (he belonged to the staff of the *Bauhaus*) he has exerted great influence upon German expressionism. Kandinsky gives up completely any similarity to shapes and forms of nature. Naming his paintings *Composition 8* (1923), *Light Blue* (1929), etc., Kandinsky presents what he calls "the inner value or melody of objects"; this he believes is achieved by painting the "abstract in the form" and by using a color harmony which is based upon the principle of "inner necessity," i.e. the principle of the "best contact with the human soul." In a great number of vigorous and phantastic line-color-shape compositions, Kandinsky demonstrates his principle that "the artist is not only justified in using forms as it is necessary for his purpose, but that it is his duty to do so,"—he considers this an obligation to his artistic honesty (*Über das Geistige in der Kunst,* Munich, 1912).

Paul Klee (born in Switzerland 1879, in Germany 1898-1933) has described some of his paintings as "a line taking a walk," and he begins his *Pädagogisches Skizzenbuch*—the original basis for a part of the theoretical instruction at the *Staatliche Bauhaus* at Weimar—(Munich, 1925, 2nd ed.), with definitions of various types of lines, e.g. "An active line which freely wanders along, taking a walk for its own sake without any aim," etc. The ascribing of active forces and expressive energies to the elements of composition is not only characteristic for the theory of expressionism, but it seems also to describe well the peculiar quality of Paul Klee's art. With thin nervous lines and with subtly shaded subdued colors Paul Klee creates exquisitely fantastic landscapes or delicate, weird and whimsical constructions (e.g. *The Twittering Machine,* 1922) which anticipate surrealism. Surrealism did not exert a very great influence in Germany, though Grosz as well as Klee are sometimes claimed for this movement which is mainly connected with the names of Kurt Schwitters and Max Ernst.

Expressionism slowly lost its dominating position about 1920 giving way to the movement of the *Neue Sachlichkeit* (q.v. new objectivism). See GERMAN ART. See also H. Bahr, *Expressionism,* 1925 (translated by R. T. Gribble); P. Fechter, *Der Expressionismus,* 1914; V. Kandinsky, *The Art of Spiritual Harmony,* 1914, (translated by M. T. H. Sadler); *Modern German Painting and Sculpture,* Museum of Modern Art, New York, 1931. —H.H.

**expressionistic criticism.** See ART CRITICISM.

**exquisite corpses.** See Dadaism.

**extensity.** As a criterion of literary value, this term refers primarily to the range of subject-matter covered in a work. It is used almost exclusively by those critics who attach high importance to the content and meaning of a work of art: and for them it measures the greatness of a work, in accord with the light this throws on matters of human interest. —I.J.

**extent of pitch.** See vibrato.

**exterior kiva corner.** As applied in southwestern archeology: The roughly triangular spaces resulting from the construction of a circular kiva within a rectangular walled area or room. These spaces are believed to have been waste spaces and to have been intentionally filled. —J.M.M.

**extra cloth.** *Book.* Cloth binding, heavily colored, concealing the weaving of the cloth.

**extrados.** *Arch.* The exterior curve of an arch or vault.

**eye.** See PERSPECTIVE.

**ezo** (Jap.). A portrait painting.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

# F

**f.** See NOTATION.

**fabliau.** A versified tale or romance popular among the trouvères of the 12th and 13th cents.

**fabric.** Cloth made of threads either woven, knitted or knotted or felted together.

**fabrikoid.** *Book.* An imitation leather.

**faburden.** See fauxbourdon.

**façade** (Fr.-L. *facies,* face). The front elevation or chief face of a structure.

**facial angle.** Angle formed by the crossing of the axis of the face with the axis of the skull.

**factura.** See RUSSIAN ARTS.

**facture.** Act or manner of producing an art work.

**faïence** (F.). A very friable pottery. Also enamel base for painted decoration. See CERAMICS I, II.

**faille.** Soft, flat ribbed silk fabric. Ribs are wider and flatter than grosgrain. Wears well, if not too loose in weave or heavily weighted. May be rayon and cotton.

**faldoncito.** Pendant scalloped lambrequin-like ornamental motif in Mexican churrigueresque (q.v.).

**fall-front desk.** See FURNITURE.

**false biting** (foul biting, English usage). *Etch.* A tone bitten on a plate due to a defective ground.

**false door** Simulated openings in the inner and outerwalls of a mastaba, for the passage of the *ka* or spirit.

**false tones.** See NOTATION.

**famille jaune** (F.). A term often applied to Chinese porcelain when a polychromed floral pattern has yellow as a dominant color.

**famille noire** (F.). A term often applied to Chinese porcelain when a polychrome floral pattern has black as a dominant color.

**famille rose** (F.). A term often applied to Chinese porcelain when a polychromed floral pattern has the rose as a dominant motive, or rose-color as a dominant tone.

**famille verte** (F.). A term often applied to Chinese porcelain when a polychrome floral pattern has green as a dominant tone.

**family dwelling.** See domestic architecture.

**family tradition and paintings.** See FORGERIES IN PAINTING.

**fan.** See Sensu and uchiwa (Jap.).

**Fancy, Fantasia.** Was one of the early instrumental forms which developed from the vocal motet. It reached its highest development in England during the period 1550-1660 and was most appropriately performed on an ensemble of viols though many Fantasias for keyboard instruments are found in collections of the period. Though contemporary theorists prescribe no very exact bounds for the form, most examples consist of a number of fugal sections often contrasted with intervening passages in a chordal and homophonic style. Later examples by such composers as William Lawes and John Jenkins are decidedly instrumental in style. In some cases the Fancy was followed by one or more dances or served as a serious introductory movement to a suite.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

The list given by Thomas Mace in his *Musick's Monument* mentions many of the best known composers of Fancies. "The Authors of such like Compositions have been divers Famous English Men, and Italians; some of which, for Their very Great Eminency and Worth in that Particular Faculty, I will here name, viz. Mr. Alfonso Ferabosco, Mr. John Ward, Mr. Lupo, Mr. White, Mr. Richard Deering, Mr William Lawes, Mr. Christopher Simpson, Mr. Coperario, and one Monteverde, a Famous Italian Author . . ." No Fancies by Monteverdi have been found.

Designed as they were for domestic chamber music, the Fancies vanished with the consort of viols in the change in English taste brought about at the time of the Restoration. Modern interest in the form is almost entirely due to the pioneer efforts of Arnold Dolmetsch and his associates. The late Fantasias of Matthew Lock should be mentioned as well as the very beautiful examples by Purcell.

The term Fantasia is also employed for a keyboard composition usually improvisatory in style and governed by no fixed formal characteristics. With Bach such a movement may serve as a prelude to a fugue (*Chromatic Fantasy and Fugue*) or as an introductory movement to a suite. The fine Mozart *Fantasia in C minor* leads into a complete sonata in the same key. The independent work in D minor has a looser and less unified character. Beethoven who uses the term infrequently twice employs it as if he were explaining that the sonatas in question were treated with unusual freedom. The more familiar example is the so-called "Moonlight Sonata" (*Op. 27, No. 2*) which is marked "Quasi una Fantasia". More recent composers have not favored the form though Schumann has left an important example in his Opus 17.

—C.W.H.

**fandango.** Has been one of the most popular of the classic Iberian Spanish dances. It is danced by men and women facing each other in lines, and playing their own accompaniment upon castanets. The general form and style are closely related to those of the sequidilla, from which it is said to have originally developed. See sequidilla. —J.G.

**fang** (Ch.). A Chinese word applied to a painting which has been created in the style of another.

**fan tracery.** Decorative tracery on **fan vaulting**; vaulting in which the ribs diverge like the rays of a fan.

**far eastern art, symbolism in.** See SYMBOLISM IN FAR EASTERN ART.

**farandole.** A French national dance traditional in Provence, is one of the most spontaneous of all folk-dances. A leader guides the dancers through the streets in a long line linked by holding hands, ribbons, or handkerchiefs. The procession, continually growing longer, weaves back and forth or winds and unwinds according to the fancy of the leader, who is accompanied by musicians playing flutes and tambourins. The music is in strongly accented 6/8 meter, stimulating the brisk walk or skip of the dance. The farandole is performed on feast days as the prelude to an evening of dancing, leading the crowd to a central gathering place. —J.G.

**fat clay.** See ball clay.

**Fatamid art.** See ISLAMIC ART.

**Fat-shan Chün yao** (Ch.). Place name—imitation of Chün yao (q.v.).

**fauces** (L.). Passage from the door of a house to the atrium.

**Fauves.** See FRENCH ART; post-impressionism.

**fauxbourdon** (mid. Eng. *faburden*, It. *falso bordone*). A form of rudimentary harmony or discant using progressions of chords in the 6th, i.e. 1st inversion chords, beginning and ending in chords of the fundamental position. There are two varieties, the older "English discant" style in which the lowest voice is the *cantus firmus*, and the continental style in which the *cantus firmus*, though written in the lowest part is performed an octave higher, hence false base.

The testimony of theorists and available MSS., indicates an English origin. The expansion of harmonic resources during the 14th and 15th cents, in which the role of the 3rd and 6th is in evidence points to the marked influence of fauxbourdon. See M. Bukofzer, *Geschichte des Englischen Diskants und des Fauxbourdons*, 1936. —V.A.

**F clef.** See NOTATION.

**federal architecture.** The architecture that houses the activities of the sovereign government in a federation of states such as The United States of America, as distinct from the architecture of the subdivisions. The Capitol and Supreme Court buildings in Washington, D. C. and Post Office and Federal

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

Reserve Bank buildings throughout the nation are examples. —O.M.S.

**felt.** A material made of matted fibres of wool, fulled or wrought by rolling and pressure with "lees" or size, without spinning or weaving. Today a fine felt is sometimes a woven material with a felted surface. Man probably produced true felt before he developed fabrics. —G.W.R.

**felt carpet.** See carpet structures.

**felted rugs, primitive.** Preceding discovery and practice of manual crafts of carding, spinning and weaving, skins of animals were used as clothing and mats or rugs on which to recline. These applications perhaps suggested feasibility of working fibre, hair, or fur into a matted or felted texture. Felt rugs originally were an eastern production produced from primitive times in various parts of Asia. —B.E.J.

**felting matting.** One of the earliest varieties of carpeting. A type of cloth producible independently of the operations of spinning and weaving. Yarn is not used. Produced by the opening and separating of the filaments of wool followed by reblending into compact adhesive layers of uniform thickness and density. —B.E.J.

**felt pattern.** Obtained in two ways: (1) Block printing on felt surfaces; (2) by felting color ingredients consisting of portions of selected dyed wool into the nŭmŭds in the operation of fulling. —B.E.J.

**felts Persian.** Designated as *nŭmŭds* or *nammads*. A *nŭmŭd* is not a solid colored felt like that made by machinery but a decorative floor covering diversified in colors and patterns. —B.E.J.

**fenestration.** The arrangement and disposition of the window and door openings of a building with regard to proportion and detail.

**fenestella** (It.). A small windowlike opening in the front of an altar, so the relics within can be seen.

**fêng-huang** (Ch.). Bird of good omen. A long-tailed pheasant-type of bird, commonly called the phoenix. Scientifically known as Rheinart's ocellated argus. See SYMBOLISM IN FAR EASTERN ART; also Phoenix in Fact and Fancy, Alan Priest, *Bull. Metropolitan Museum of Art*, Oct. 1942, p. 97-101.

**fên su jên wu** (Ch.). Genre painting.

**fen-ts'ai** (Ch.). Enamel colors.

**feretory.** A highly decorated, often movable, bier or shrine for the relics of a saint; the chapel inside which this was kept.

**ferroconcrete.** Reinforced concrete.

**ferronnerie** (F. hand wrought iron work). Lustrous velvets of the 15th and 16th cents. having slender tracery designs resembling wrought iron work.

**fertility cult.** See PRIMITIVE ART.

**fesse.** See HERALDRY.

**fetish.** See PRIMITIVE ART.

**ff.** See NOTATION.

**fibers, textile.** Slender filaments or strands that cling together, enabling them to be spun into yarns of appreciable strength and sufficiently pliable to be woven into fabrics. Textile fibers include cotton, flex, jute, and other fibers of vegetable origin, silk, wool and various hairs of animal, rayon, and allied synthetic or artificial fibers, asbestos and glass. —G.W.R.

**fiberglass.** See GLASS AND GLASSMAKING.

**fiddle.** See MUSICAL INSTRUMENTS.

**field.** See HERALDRY.

**field, of a rug.** The central or main part.

**field of view.** See PERSPECTIVE.

**fife.** See MUSICAL INSTRUMENTS.

**figuration.** *Mus.* (1) The development of florid counterpoint by the introduction of figures, runs, etc. (2) Embellishing a theme by adding to or by ornamenting the melody with grace notes, runs, florid passages. (3) The working-out of a figured bass.

**figured bass.** *Mus.* A bass with chords indicated by figures.

**Fikellura ware.** See Ionian vases.

**filler panel.** See FURNITURE.

**fillet.** *Book.* (1) The tool—a wheel fixed on an axle—with which lines are made on book covers. (2) The ornamental line, often of gold, made on a book cover, usually at the top and bottom of the back. (3) That part of a cover design which completes the design

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

after outline portions are made. *Arch.* A narrow flat member; esp., a flat molding separating other modlings; also, the space between two flutings in a shaft.

**filling.** The woof of a woven fabric. Also called filler, tram.

**filling motifs.** Various ornaments used to fill the space between figures in Greek pottery of the 8th to 6th cent. B.C., e.g., spirals, rosette, circles, rhombus, meander, swastika, etc.

**film color.** See COLOR.

**final, finalis of a mode.** *Mus.* The note on which a melody must end in any of the church modes, answering to our tonic or key note. See scales and modes; idiom A (2).

**finale.** *Mus.* The last "number" of an opera act; the last movement of a symphony.

**fine art.** See classification of the arts; art.

**fine arts, academy of.** A school or institute of learning where courses of instruction are given in drawing, painting, sculpture, design, architecture, and other visual or space arts. (First academy of art in Europe was founded by a group of Venetian painters in 1346.) Whitford and Winslow in *Dictionary of Education.*

**fine binding, bookbinding.** See EARLY BOOKBINDING AND FINE BINDING.

**fingerpainting.** See CHILDREN'S ART; chih hua.

**finial.** The decorative foliate ornament forming the upper extremity of a Gothic gable, pinnacle, buttress, etc.

**finishing.** *Book.* The last stage of binding, including the gilding, tooling, etc., in hand work. The "finisher" is the one doing the work. See EARLY BOOKBINDING AND FINE BINDING.

**fioritura, fioriture** (It.). *Mus.* Embellishment (s) interwoven into a melody.

**fireback.** The rear wall of a fireplace

**fire-gilt process.** Amalgam of gold and mercury washed onto a metal base, heated to drive off the mercury, then burnished.

**fire pit.** A pit or cavity, generally sunk entirely below the floor or given level, in which a fire is built; a fireplace.

**fireplace.** A recess, structure, pit, or place in which or on which a fire is built. See INTERIOR ARCHITECTURE AND DECORATION.

**firing.** Process of heating or burning of all ceramics. See CERAMICS I.

**First Federal (National) Period.** See POST-REVOLUTIONARY ARCHITECTURE AND DECORATIVE ARTS IN THE U.S.A.

**fishroe pattern.** Often a punched pattern representing a mass of fresh fish roe.

**fivecolor ware.** Chinese porcelain on which the colors, red, yellow, green, blue, and violet, are used.

**five Dynasties art.** See CHINESE ARTS.

**five poisons.** See SYMBOLISM IN FAR EASTERN ART.

**fixative.** A liquid used by artists to bind the loose particles of charcoal, pastel or crayon pictures and prevent them from rubbing off. It acts only in a weak, surface manner; for this purpose it is neither necessary nor desirable to produce an impervious film as do the varnishes which are applied to oil and tempera paintings. —R.M.

**fixed do.** See movable do.

**flageolet.** See MUSICAL INSTRUMENTS; ACOUSTICS.

**flagon.** A velles with handle, spout and lid, with bulging body, contracted neck, flaring lip and stable foot.

**flagstone.** A broad, flat stone suitable for foot-pavements.

**flake white.** See white lead.

**flambé** (F.). A term applied to Chinese porcelain when glaze is splashed or irregularly applied.

**flamboyant.** See Gothic.

**flame ornament.** See Gothic.

**flamenco dances.** See tango.

**flanning.** The internal splay of a window or door opening.

**flashback.** See RADIO DRAMA.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

**flashed.** *Cer.* Irregular discoloration caused by direct contact with flame. See CERAMICS I.

**flat.** *Mus.* The sign *b* which when placed in the signature or after a note, lowers the pitch of the note involved by a semi-tone.

**flattening (or stretching).** Intaglio prints are usually printed on damp paper, which necessitates drying the proofs between sets of blotters under pressure to prevent the proofs from wrinkling.

**flautando.** Producing a flute-like tone on the violin.

**flax** (AS. *fleax*). The soft, silky fiber, 2′ to 3′ long, comes from the inside of the bark of the flax plant. There are more than one hundred species of this plant, from the fiber of which can be made the sheerest linen, the most exquisite lace or the heavist ropes.

—G.W.R.

**flèche.** A spire, esp. a long tapering one above the crossing of the nave and transepts of a church or cathedral.

**fleece.** Comes from the back of the sheep and is held together by the intertwining of the fibres.

**FLEMISH ART.** The art of all the provinces which now make up the kingdom of Belgium is called Flemish art. The Dutch contributed greatly to the development of this art long before their cities supported artists. Although some good sculpture and architecture was created, Flemish art generally refers to the style of painting developed in Flanders from the 14th to the 17th cent.

The general aesthetic quality which distinguishes the Flemish school is a sharply focused realism manifest in all phases of its development. The Flemish artists' uncritical literalness expressed itself through a passion for accuracy and precision of outline. Their love for craftsmanship led them to develop and gain complete control over an oil painting medium at an early period. A delight in the commonplace and a lack of generalizing spirit caused them to imitate familiar things with a keen observation, brilliance and solidity of technique. Their love of life stimulated their sense of color and pageantry. A taste for satire and symbolism suited to the conventions of the time imbued their work with a vivid realism.

This early manifestation of realism in the Flemish school was a result of a long tradition of miniature painting extending from Romanesque times through the Gothic period into the Renaissance. This art, coupled with a long tradition of craftsmanship developed in the tapestry industries, favored the development of art in the Low Countries.

Sculpture and architecture in Flanders followed the Romanesque and Gothic traditions. Gothic art continued in Flanders long after it had waned in Italy. The abstract design of the Gothic period fused with the realistic tendency of medieval Flanders to form a new style of art essentially different from any development in Italy. The southern artist was interested in arrangement of form and color for representation while the Flemish artist was interested in a literal presentation of significant activities. The Italians therefore, used color for its plastic effect while the Flemish artist used it for its effect of pageantry.

Primitive Flemish art, which is only primitive chronologically, emphasized the flat, decorative quality of Gothic design and used paint primarily as a vehicle for drawing. The flowering of Flemish art came in the 14th and 15ht cents. in Bruges and in the 17th cent. in Antwerp. The great period in the 15th cent. begins in Bruges with the work of the brothers Hubert and Jan Van Eyck who developed and perfected the oil painting technique of the early Flemish painters. The Van Eycks painted religious pictures and portraits of such accuracy as to mark the beginning of realistic art in Europe. They pursued realism tenaciously until the resemblance was complete and the external characteristics were copied down to the last hair or wrinkle. They attempted to capture moral resemblance by copying the appearance of things. Their contribution to the craft of painting is exemplified by the marvelous state of preservation of their paintings.

In the second half of the 15th cent. Peter Christus worked at Bruges and began painting episodes from real life such as his *Legend of Ste. Godeberte.*

A popular school of painting developed in Tournai which was conventionally religious and influenced the schools of Ghent, Haarlem and Louvain. The leaders of the school at Tournai were Robert Campin and Roger Van der Weyden who were contemporaries of the Van Eycks. Campin's work is closely related to the school of sculpture which was flourishing at Tournai. Roger Van der Weyden introduced a new note into Flemish art with

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

his painstaking portraits. His work refined and enlarged on the art of the Van Eycks.

Dierick Bouts came to Flanders from Holland and his work resembles that of Roger Van der Weyden. He painted important historical pictures such as *The Injustice of the Emperor Ohio.*

Hugo Van der Gos, who worked a generation after Peter Christus, led the Flemish school into a broader path of realism which survived for several generations.

During the second half of the 15th cent. Flemish painting entered a new stage of freedom with the religious paintings of Hans Memlinc. He settled in Bruges and painted many religious pictures and small portraits. They are fused with a hazy, pervading light and handled more broadly than those of his predecessors. He acquired the plastic quality of the Italian style while retaining the microscopic fidelity of the Flemish style.

The last great painter of the Bruges school is Gheerardt David who came from Oudewater. He maintained the Bruges tradition while introducing a Dutch note of serious calm in his work. Although the Primitive tradition did not end with the Bruges school, its greatest exponents painted there.

At the beginning of the 16th cent. Antwerp succeeded Bruges as the center of Flemish art. With this shift architecture, sculpture and painting began to be modified by the Italian Renaissance influence. The first great artist of this school was Quentin Massys. His work was still in the Primitive tradition but he introduced a new note in his understanding of the artistic merit in the trivial and vulgar reality of everyday life. His work also shows the increasing influence of Italian art. Two other members of this school, Joachim Patinir and Hendrik Bles, made their reputation as landscape painters. Before it died out the Primitive school produced two more great Holland realists in Jerome Bosch and Pieter Breughel. Bosch did not confine himself to imitation but invented wild and grotesque fiction. His biblical paintings were very popular in Catholic Spain where he was considered a great moralist. Pieter Breughel was a painter of his time and for his people and his work portrays wit and homely moralizing. He painted many scriptural subjects, genre scenes and made numerous drawings and engravings to illustrate proverbs. He developed the art of landscape painting to a new height.

From this period on the Italian influence became more pronounced. At first it destroyed the Flemish tradition but gradually the two styles merged. This process took place during the greater part of the 16th cent. By the beginning of the 17th cent. the real principles of Italian art had been absorbed. Among these Italianizers were Jan Gossart (Mabuse), Van Orley, Lancelot Blondeel, Jan Massys and Frans Floris. So great was the Italian influence that many of the artists called themselves "Romanists."

Portrait painting, an integral part of the Flemish tradition, became popular in the middle of the 16th cent. and is well exemplified in the work of Antonio Moro.

During the last half of the 16th cent. the artists divested themselves of both the Italian and early Flemish influence to develop a clever style of historical painting. At the beginning of the 17th cent. a taste for more naturalistic art developed and copper-plate engraving became popular in Antwerp.

The beginning of the 18th cent. ushered in a type of renaissance church building sponsored by the Jesuits and known as the "Jesuit" style. In the early 17th cent. Peter Paul Rubens, an artist, scholar, courtier and diplomat, brought about a resurgence of the Flemish style. In his workshop was developed an art style that greatly influenced painters and sculptors of the period. His work combines the best qualities of the Italian and early Flemish styles into a new synthesis that was to influence the direction of future painters. He painted allegorical, historical and mythological subjects, portraits, landscapes, still-life, and biblical scenes. Among his distinguished pupils and followers were Anthony Van Dyck who was noted for his portraits, Gerard Seghers and Frans Snyders, the last of whom was famous for his still-life and animal pictures. These artists and many other collaborated with Rubens in the execution of a large volume of pictures. Jacob Jordaens, Sustermans and many other painters followed in Ruben's style.

The native bourgeois and genre tradition was continued by Adriawn Brower and the Teniers family. After 1700 painting continued in Flanders on a mediocre scale compared with former times.

Belgian art flourished in the 19th cent. and the sculptures of Constantin Meunier attracted considerable attention. Painting followed the academic dictates of the French school and centered in Brussels. —R.L.W.

**Flemish primitives.** That group of painters of the 14th and 15th cents. whose work still

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

retained the naiveté and rigidity of style characteristic of the medieval ages. Primitive does no refer to a lack of facility or ineptness, but more specifically indicates a quality of design peculiar to all art forms in their early stages. The Flemish primitives include Hubert and Jan Van Eyck, Peter Christus, Dierick Bouts, Hugo van der Gos, Hans Memlinc, Gheerardt David, Roger Van der Weyden, Robert Campin, Jerome Bosch and Pieter Breughel. —R.L.W.

**Flemish renaissance.** See RENAISSANCE.

**Flemish style** (in furniture). See FURNITURE.

**flesh color.** The average color of a Caucasian's skin; low saturation of red-yellow and high in brilliance.

**flexible.** *Book.* Flexible sewing or binding generally means sewing right around the cords or tapes, or raised bands with the leather, or other back material glued to the back of the book itself so that the back of the cover bends with the book when it is opened. More properly this is a "tight back" (q.v.). —H.E.S.

**flint glass.** See GLASS AND GLASSMAKING.

**floating material.** See American folk forms, in literature.

**floats.** Warp or weft threads that are carried loose over the surface or back of the cloth.

**Florentine school.** The term Florentine school in its general sense defines the successive groups of artists (architects, painters, sculptors, and workers in the allied arts) who were citizens of or closely associated with the city of Florence (Firenze), Italy, from the last quarter of the 13th cent. until the close of the 16th cent., and who were united by common humanistic aims expressed by a variety of viewpoints and technical methods. The school is generally considered as the leading one of the Italian Renaissance (1400-1550 A.D.) due to the completeness with which it demonstrates the humanistic viewpoint of that time.

More precisely, the term refers to the painters of that city, over the same time periods, though many of these were equally proficient in sculpture and architecture. The school in reality is a group or series of strong personalities presenting individual points of view, specialized interests, and technical methods, yet united by a common humanism which is shown by a continuous and outstanding concern for form as the chief means of expression, with the accompanying interest in the pictorial analysis of observed phenomena and the investigation of all techniques necessary to representative painting. The resultant natural tendency toward an art of complete realism is modified by a common regard for classic impersonality and nobility of form.

The Florentine school of painting is divided chronologically into the schools of the 13th (**duocento**), 14th (**trecento**), 15th (**quattrocento**), and 16th (**cinquecento**) cents. The schools of the 13th and 14th cent. (Gothic) are generally grouped together as they are dominated by Cimabue (Cenni di Pepo), active during the last quarter of the 13th cent., and his greater follower, Giotto di Bondone (1266/76-1337). The remainder of the 14th cent. is given over largely to the emulation of Giotto by his followers.

The 15th cent. is marked by the complete supremacy of Florence as the leader of the Renaissance. The school at this time falls logically into three groups: first, the painters who continue largely in the Gothic tradition, represented by Fra Angelico (1387-1455); second, the progressive realists, led by Masaccio (1401-ca. 1428) and represented toward the close of the century by Andrea Verrocchio (1435-1488) and Leonardo da Vinci (1452-1519); third, the narrative group, which combined realism with documentary recording, represented by Fra Fillippo Lippi (ca. 1406-1469) and Domenico Ghirlandaio (1449-1494). It is also feasible to form a fourth group of extreme individualists working in the last quarter of the century, such as Sandro Botticelli (1444/45-1510) and Piero di Cosimo (1462-1521). There is no unified agreement as to the artists to be included in or excluded from the school. Some authorities list such men as Piero dei Franceschi (della Francesca) and Loca Signorelli because of their acceptance of Florentine aims. (Michelangelo is often classified as Roman due to his long residence in that city, though Giotto is always listed as Florentine in spite of many years in Assisi, Rome, and Padua.)

The 16th cent, is opened brilliantly by such men as Leonardo da Vinci, Michelangelo Buonarroti, and Andrea del Sarto (1486-1531), but with certain exceptions (Agnolo Bronzino) is marked by a rapid decline in quality and leadership. The last half of the century is

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

barren when compared with the first thirty years.

The Florentine school of sculpture rivals that of Pisa in the 14th cent. and dominates Italy in the 15th cent. It contains such men as Andrea Pisano (14th cent.), Donato di Bardi (Donatello), known as the Father of the Renaissance, Lorenzo Ghiberti, Luca della Robbia, Andrea del Verrocchio, and Benedetto da Majano, all of the 15th cent., and Michelangelo and Benvenuto Cellini of the 16th cent. See ITALIAN ART; also Vasari, Giorgio, *Lives of the Painters,* ed. by E. H. and E. W. Blashfield and A. A. Hopkins, 4 vols., 1926; Van Marle, Raimond, *The Development of the Italian Schools of Painting,* 18 vols., 1929-37; Berenson, Bernhard, *Italian Painters of the Renaissance,* 1932 and *Florentine Painters of the Renaissance;* Offner, Richard, *A Critical and Historical Corpus of Florentine Painting,* 1930 ff.; Mather, Frank Jewett, *A History of Italian Painting,* 1923; Schmeckebier, Laurence, *A Handbook of Italian Renaissance Painting,* 1938. —J.C.

**florid.** *Mus.* Embellished with runs, passages, etc.

**flossa.** An old Swedish technique for pile rugs similar to the Turkish or Ghiordes knot (q.v.) in oriental rugs.

**flower and bird painting.** See CHINESE ARTS.

**FLOWER ARRANGEMENT.** An art using as its medium cut flowers and branches, fungus, moss and so forth, arranged in unified compositions either in vases, or in garlands, wreaths, bouquets or other forms. The medium has unique aspects different from those of most other mediums used for creative expression, whether conceptual and representational, or purely decorative. The most conspicuous of these aspects is fragility, impermanence; flowers fade and arrangements disappear. This has not led to their being treated with less care or technical virtuosity than any other art medium, but it has, in Western countries, affected both the development of the art and man's attitude toward it. Without tangible objects to deal with, the art has, in a measure, been taken for granted. In the West, where only the decorative and symbolic potentialities of this art form have been exploited, the record of its achievements has, with rare exceptions, been incidental and accidental. This record is found in representational arts, paintings, mosaics, miniatures, sculptures, and tapestries, where flower arrangements are a part of the "taken for granted" decorative scene in which the main action of the picture takes place. (The exceptions are the still life flower paintings and prints of the 17th and 18th cents.) There is hardly a book in existence dealing with the arts of particular countries where flower arrangements are mentioned. The exceptions are notable and prove the point. Howard Carter, in his second volume on the *Tomb of Tut-Ankh-Amen,* because he discovered actual flower chaplets and necklaces, gives several paragraphs to a description of their elaborate technique; and Mr. H. E. Winlock, in the presence of a gold dish from Egypt definitely proven to have been made for flowers and for no other purpose, writes a complete and illustrated article on one type of Egyptian flower arrangement. (*Metropolitan Museum Studies,* vol. V, 1934-36, p. 151.) In Japan the story is quite a different one. Here, as in China to a more limited extent, the conceptual possibilities of this art form have been developed, with the result that meaning in flower compositions has caught the human imagination and has given a basis for discussion, comment, judgment and evaluation. The art has had in Japan as much recognition as any other and has furthermore a long recorded history as well as its own aesthetics. (Both countries have a highly developed flower symbolism, and flowers or branches grouped together to convey a symbolic message are used for special occasions.) It is noteworthy that in the West the invention of photography, esp. color photography, has given a kind of permanence to the art, and that with this a definite body of opinion and judgment, even the dawn of a few ideas, is appearing.

Another distinguishing characteristic of the medium is the strong symbolic and associational nature that flower shapes and colors have assumed in the minds of men. This is natural enough in view of the fact that flowers have played an omni-present role in our lives for centuries; as offerings in temples and churches, as gifts to honor the dead, and as adornments for the living on occasions of importance when seasons and anniversaries are being appropriately observed. This symbolic character of the very medium itself, as well as its predetermined form, is both its strength and its limitation as material for creative expression. Its strength is in that it develops its representational possibilities. The Chinese and Japanese can convey a specific meaning of

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

good will in a flower composition through the proper selection and combination of different plants (the pine for constancy, the plum for wedded bliss, the magnolia for a woman's grace and charm, etc., etc.). This was done in a sentimental, literary way in the West in the Victorian **tussy mussy**. Its weakness is that symbolic meaning and associations of ideas are apt to cling to the material in whatever context it may be used. This is scarcely true of any other artistic medium. The potentialities of the medium for the expression of abstract decorative themes and all that these may be led to suggest or to impel one to *feel,* through empathy, are almost limitless. Line, color, mass, texture, shape, scale, with the opportunities for their thematic development are all there with the added factor of fragrance. It is these potentialities that have been developed in the West (until the moment of Japanese influence) to the exclusion of all others, except the literary symbolic combinations of religious and heraldic content. Through the centuries flowers have been formed into thematic schemes of color, line and mass which reflected the prevailing decorative taste of the period. Baroque arrangements were large in scale, with heavy masses, strong, and dark in color, composed along a swirling S curve. (There is probably a certain amount of suggested matter here: *abundance* in the heavy masses; *confidence* in the sweeping, bold curve.) The abstract phase of modern art has had its counterpart in flowers; material such as cacti, succulents and other exotic forms, were skillfully chosen to contribute through shape and other characteristics to clear-cut, precise, machine-like compositions, and were manipulated into severe repetitions of line and shape that suggested the staccato beat of the piston. It was interesting to observe how much variety there was in the enormous amount of rare and exotic flower material that suddenly became available when this taste was in the wind.

Further decorative possibilities of the medium, necessitating the development of the highest degree of technical ingenuity and skill, have been developed in countries as far apart in time and space as Siam, Bali and Ancient Egypt. In Siam, flowers are taken to pieces down to their very stamens and recreated into new and different flower forms. The ancient Egyptians also made new forms out of the parts of flowers. Because of their taste for stiff, formal, tightly and symmetrically balanced designs, with borders of repeated units, their flowers were organized in the same way. They carried long **thyrsi** in funeral processions and short, stiff, fan-shaped bouquets in everyday life. These were miracles of patient and skillful craftsmanship. At the top there were three heads of either the lotus or the papyrus blossom, symmetrically arranged and held in place by a band made up of rows of petals and tiny buds or berries; along the length of the stick, which was the foundation of the arrangement, spaced at regular intervals and held in place by the same kind of flower band as was used at the top were groups of large flower heads. A pretty woven handle of reeds finished it off. Chaplets and necklaces of real flowers, buds, petals and berries were designed and executed with a skill to rival that of any jeweller. The resulting artificial effect would not accord with our ideas of how flowers should look. In Bali the towers, or **kbogans**, composed of tier upon tier of fruit, flowers and leaves, with a waving mass of flowers on top are much like Egyptian compositions, in which contrasting shapes, sizes and colors create the decorative interest. These examples of the decorative possibilities of the medium, while they do not cover the historic field, give some idea of the range of experiment that has been made.

When we turn to the representational aspects of flower material, distinct from symbolism, we must turn to the East to see what has been realized. *Direct representation* is obviously easy enough, and both the Chinese and Japanese have over centuries made flower arrangements, in flat containers, that imitate not only growing trees and plants but broad landscape effects with foreground, middle ground and distance, the shapes of mountains and contrasting valleys, as well as more restricted scenes, a curving shore line or the corner of a garden. To accomplish these effects, they use various rocks of interesting shape and texture as well as weathered wood, mosses, fungus and other accessories. (It may be added that one of the rules in Japanese flower arrangement is that all flower material used shall be so placed in the vase that it looks as though it were still growing, not like a cut flower stuck in a vase.) This style of landscape composition is called by the Japanese ***moribana style*** (***moribana*** means piled-up flowers). But more than direct representation is possible with this material. Certain suggested meanings are inherent in the medium itself. Flowers and branches are out of Nature and can be used to express man's enjoyment of Her, his reactions to Her, even to suggest the moods that She induces in him, and certain

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

comments he might make upon his place in Her scheme of things. Such experiences as vastness, bleakness, coldness, windiness, and the character of the seasons can be suggested. The Japanese style of flower arrangement called rikkwa (meaning "standing-up plant-cuttings") which was evolved by a flower artist in the 11th cent. to convey his impressions of natural scenery is more abstract, formal and suggestive than the moribana style. Rikkwa and all Japanese styles have a romantic tendency. To make the medium adequate to express their meanings the Japanese early developed precise techniques and equipment. They have various holders, metal, forked sticks, and other devices to keep the flowers firmly in place; containers, in many different shapes, are made specifically for flower arrangement, of bronze, pottery, basketwork, bamboo and other woods. Techniques and personal modes of composition were taught by masters of the art, who thus founded schools which have maintained the tradition of the founder to the present day. New schools have appeared when artists have presented sufficiently original ideas to mark a real departure from tradition. Today the tendency is away from representation and toward the decorative.

With the large amount of written tradition and theory that exists in Japan, it was easy enough when we in this country became interested in their flower arrangement to present us with a clear account of its aims and values. There are now many excellent books in English on the subject. Flower arrangement in this country gained enormously when the influence from Japan was felt. While we were learning in the 1920's, chiefly through the offices of John Taylor Arms, to consciously apply the principles of good design to meaningless Victorian bunches and shapeless masses of flowers there comes a time when one gets tired of exercises and wants to play a real piece of music. The Japanese consciousness of the expressive possibilities of flowers was as stimulating to us as a breath of fresh air.

There are few names of artists to record in this field of art in the West, while Japan has many. It is mentioned that Charles LeBrun made flower compositions for the gardens and galleries of Louis XIV. It seems safe to assume that the art was often practised by women, as it is today in Bali, Siam and in this country, and that, in the past as now, when men went into the field they did so because it was a lucrative trade where they could turn out wreaths and bouquets, corsages or other marketable flower pieces. The French artists Odilon Redon and Henri Rousseau show a remarkable feeling for the medium in their paintings. In Japan it has been men rather than women, artists rather than artisans, who have distinguished themselves in the field. In the past few years we in the West have a real artist in Constance Spry, an English woman, and because her work has been preserved in photographs it is possible to evaluate it. She has daring originality and has mastered the real technical problem of getting her material to hand (which means, in this art form, that she is a real horticulturalist, not only growing exotic plants in her own greenhouses, but being also familiar with sources outside of her own territory. This is not so necessary an asset in Japan where, due to the popularity of the art, there is a wide range of material on the open market.). She has invented some very useful containers, and has adapted others from various sources. She is a master of monochromatic color arrangements of modified baroque and rococo form. While she has little interest in the expressive possibilities of the medium beyond suggestions of opulence, etc., she can arrange a group of smooth white flowers in a niche so that they have as much presence as a fine piece of sculpture, and her masses of roses in color and texture are as sensuously appealing as Renoir's paintings. No discussion of flower arrangement as an art could fail to mention her as both improvisor and artist.

In closing it may be said that as one weighs the achievements and possibilities of this art medium, one is reminded more often of music than of any other art form. The possible parallels are the following. Both arts have common abstract tendencies and yet in the hands of artists can approach suggestive regions of expression. Comparisons can be made between Debussy's music, the *Waves,* for instance, and certain Japanese compositions, esp. rikkwa. Furthermore, improvisation and virtuosity in performance are qualities that they both have in common. We are all familiar with musical variations on a theme. In Indian music, such variations are the spontaneous expression of a singer or the master of an instrument before his audience. Japanese flower arrangement has, in its tradition, flower artists who were masters of improvisation. They tell of competitions held long ago, where the artist, presented with flowers and vase, who could create an artistic achievement with technical brilliance, as well as wit and ingenuity, won the prize.

While such comparisons may seem tenuous they throw into relief certain illusive qualities of this art form. See John T. Arms, *Design in Flower Arrangement;* F. F. Rockwell and E. C. Grayson, *Flower Arrangement in Color;* Alfred Koehn, *The Way of Japanese Flower Arrangement;* Oshigawa and Gorham, *Manual of Flower Arrangement;* Mary Averill, *The Flower Art of Japan;* Constance Spry, *Flowers in House and Garden.* —M.F.M.

**flowers of the four seasons.** See SYMBOLISM IN FAR EASTERN ART.

**flue.** A channel or passage for smoke, air, or gases of combustion; a chimney.

**fluff mats.** Made by cutting cloth into small strips about ½ in. to ¾ in. wide by 2 in. to 2½ in. long and crocheting these into the mat. Coarse yarn used for crocheting and the pieces of cloth were caught at their middles into the stiches leaving both ends on top of the crocheted web. This produced a mat covered with a pile formed by cut ends.—B.E.J.

**fluorescence.** Some objects when seen under ultra-violet light reflect a characteristic glow or fluorescence This property is useful in detecting repairs on paintings and objects.

**fluorescent bodies.** See COLOR.

**flute, flute d'amour.** See MUSICAL INSTRUMENTS.

**flutes.** Grooves of curved section, used to decorate columns in classical architecture where they were cut vertically along the shaft.

**flux.** *Cer.* Material which melts to form binding agent when cooled. See CERAMICS I; ENAMELLING ON METAL.

**flying buttress.** A masonry structural member usually arched which carries the thrust of a ceiling vault or roof to a detached pier. See Gothic.

**fly-leaf.** *Book.* A blank leaf at the beginning and end of a book, usually in addition to the loose leaf of the end paper and next to it.

**fly-whisk.** Often depicted in East Asiatic art in the hands of deities, bonzes or sages. Generally of white yak- or horse-tail hairs fixed in a short handle. Symbolic significance, "to clear away the dust of this world." See Cāmara; canrī; hossu. —J.A.M.

**focus, in dance.** See movement.

**foil.** A leaflike space or arc between the cusps in Gothic tracery. Trefoil indicates three such arcs in the ornamental unit.

**folding chair.** See FURNITURE.

**folia.** *Mus.* A slow tempo. Spanish dance in 3/4 time

**folio.** *Book.* A book size (q.v.). Also a sheet of paper folded once to make four pages.

**folk art.** Basically, folk art is an aspect of folklore which characterizes the change of a group from a primitive to a rural or cultured status. It is a part of the pattern of the folkways of the group, the mores of which may dominate, while the arts liberate, in a complex of traditions, festivals, songs, and ornament. Leaving the point of view of sociologist and psychologist, the student must next distinguish folk art from or mediate it with, other forms of art. It is comparable to primitive art only if survival elements predominate; it is peasant art only if unsophisticated and strongly traditional elements are patent; it is popular art only if at the chronological level under consideration widespread employment of the forms is clear; it is regional, provincial, colonial, immigrant, or frontier, dependent upon the geographical, political, or environmental setting of its expression. Folk art is never aristocratic, dictated by fashion, or fostered by a patron. It is rather the expression of the people, traditionally, naively, economically.

The mixed influence of folk art on other art forms or *vice versa* are also worthy of note. A folk art may influence in its later phases art forms on levels far different from the one of its origin. One thinks of Japanese prints and Manet, or of African negro sculpture and Picasso. The influence may, again, come from an art form of a sophisticated mode and help define the appearance of a popular form. One recalls della Robbia's glazed terra-cottas, the printed page which long echoed illuminated manuscripts, and the color reproductions of our own day. The influence may, again, be horizontal, rather than vertical, as when the textiles of a museum collection are reproduced on electrically-run looms.

Folk art, then, is an essentially naive, nonacademic, frequently untrained type of art. It is founded on traditional techniques; it concentrates on things rather than on ideas; its craftsmen know the satisfaction of recreation rather than that of creation. Everyday objects of dress, utensils furniture, or

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

portraiture are its major concern. It is a minor art in a world where nature is the producer of the major. See T. Munro and P. Guillaume, *Primitive Negro Sculpture,* 1926; *American Folk Art,* 1932 and *Masters of Popular Painting,* 1938, Mus. of Modern Art; F. H. Haire, *The Folk Costume Book,* 1926; C. H. Holme, editor, *Peasant Art in Sweden,* 1910, *Peasant Art in Austria and Hungary,* 1910, *Peasant Art in Russia,* 1912, *Peasant Art in Italy,* 1913; D. Baud-Bovy, *Peasant Art in Switzerland,* 1924. —W.S.R.

**folk dance.** Literally means the dance of people and in that sense is synonymous with all "dance". The distinction habitually drawn between folk and art dance may be false unless it is made with an understanding of the fundamental inter-dependence of the two. The difference between them is in fact more a difference between two growth stages of one human activity, comparable to the difference between a plant and its seed.

Folk dance is the growth stage which stands midway between dance as a partly instinctive and reflex reaction to environment and dance as a form consciously pursued for its own art value. The partly instinctive activity became more deliberate in folk dance, and, though its basic purpose remained the expression of human feeling, it acquired other associated purposes. The people of individual nations danced also for the joy of communal activity, for the expression and heightening of their common emotion, and for the sense of unity such group expression gave them.

The form and content of such dances varied within limits according to the national or racial differences between groups. These limits were narrow, however, as is repeatedly shown by the universality of certain patterns and movements among dances of all nations, and stand as proof of the constancy of all basic human reactions to living.

Folk dance has been and is the nutritive source which provides art dance with its elemental material, however the expression of that material may be developed for more powerful communication. —J.G.

**folk-radio.** See radio and music.

**folk song.** A simple song in ballad-form tinged by the musical peculiarities of a nation. See song.

**folk song, Jewish.** See JEWISH MUSIC.

**folly** (from ME and OF *folie,* foolish, mad), in architecture, an extravaganza, a monument without functional intention or significance; a concrete expression of the builder's private and cabalistic theology, an embodiment of his wit or spite, a mirror to his vanity; a house abandoned uncompleted because its scale exceeded its owner's purse; any building which completely lacks utility or meaning in the eyes of the neighbors. The folly is particularly associated with 18th cent. England, a time and place when indulgence in this aberration of the art of building attained the proportions of an epidemic and its survivors stand as minor, characteristic expressions of an age. Yet the folly knows neither style nor period nor nationality, and seldom speaks to reason. Conspicuous examples litter the centuries, from the Tower of Babel to the Maginot Line, but the hair dividing what is folly from what is not is difficult to define. Whether or not a particular object be a true folly depends upon the sensibilities of the beholder. Some are held to be so by common consent, others are arguable. The *folies de grandeur* committed on the orders of certain Caesars, contemporary as well as Roman, do not fall within this classification, nor do most of the wilder flights of baroque imagination in civil architecture; the palace and gardens of the Prince of Palagonia, La Bagaria in Sicily, provide a notable exception, as does the earlier Palazzo Cattaio, near Monselice, built from strictly literary specifications; Marco Polo's description of the Imperial Palace in Peking. Architectural expressions of a social as opposed to an individual psychosis in which the mental unbalance is clearly mirrored in the architecture itself as in the unfinished Cathedral of the Sagrada Familia by Gaudi in Barcelona, are genuine follies; but it is unfair to classify monuments to unfulfilled ideals, as the Palace of the League of Nations in Geneva, by this title. The earliest authentic follies in England were both built in Northamptonshire by the recusant Sir Thomas Tresham who designed Rushton Lodge (1595) and the unfinished house called Lyveden New Building to symbolize his private views on the Passion; subsequent follies of a religious nature include the Georgian church built by "Hellfire" Sir Francis Dashwood on the crest of a steep hill at West Wycombe in the cynical hope that no parishioners would ever ascend to it; the group of cottages embellished with a false-front Norman church tower of only three sides at Tattingstone, Suffolk (1790) to improve theSquire's view; and Jez-

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

reel's Temple, near Rochester, projected and partially built by James White in 1885 in preparation for the end of the world. The most conspicuous follies took the form of isolated towers, many of them subsequently destroyed by lightning. Freston Tower, Suffolk (c. 1595) and Eyre's Folly, Wilts., (Jacobean), are early surviving examples; of the 18th cent., Sir William Chambers' delightful Chinese pagoda in Kew Garden, Stratton's Folly at Little Berkhamsted (1789), the Sugarloaf Folly above Dallington, Sussex, hastily erected by "Mad Jack" Fuller to win a rash bet that Dallington Church spire was visible from his drawing room, and William Beckford's Lansdowne Tower at Bath are notable. The latest and loftiest is Wainhouse Folly, Halifax, reared to a height of 282 feet between 1871 and 1874. Nearly every 18th cent. country house boasted its Temple, Artificial Ruin, Triumphal Arch, Pyramid, Tower, Gazebos, Grottoes, or Ornamental Mausoleum; some parks were ornamented with all these species, as at Stowe, which afforded a tasteful collection of follies without equal in the kingdom. The most modest follies were **grottoes**, stemming from memories of baroque gardens in Italy and France: Evelyn and Sir William Temple had the earliest, Pope popularized them with his celebrated (and utilitarian) one at Twickenham; the Duchess of Richmond and her daughters built a famous one with their own hands (1740), adorned with shells in striking anticipation of the Adam manner, at Goodwood House; Payne Knight's Cold-Bath at Downton Castle was admired by tourists; and none exceeded in luxury Beckford's Grotto at Fonthill, inhabited by a hired hermit. In the next century the grotto follies attained their apotheosis at Liverpool, where Joseph Williamson built himself a huge underground establishment (c. 1820, ostensibly as a private work-relief project), and at Welbeck Abbey where the 5th Duke of Portland excavated a still more vast subterranean palace (without excuses). The most magnificent Triumphal Arch, popularly known as "The Gates of Jerusalem", was erected at Shugborough Park in 1763 from designs of James Stuart, ostensibly as a memorial to Admiral Anson. The Pyramids were generally intended for tombs, though sometimes merely as epigrammatic incidents in a landscape; outstanding are that of John Knill above St. Ives in Cornwall (for himself) and the two built by Jack Fuller, one of them at Brightling for himself, the other on Farley Mount, Hants, for a favorite horse. Francis Dashwood's mausoleum at West Wycombe and the unfinished colosseum overhanging Oban Harbour are other notable sepulchral follies. The most curious coincidence of imitation Roman *tempietto* and sham Gothic ruin is still to be seen in the grounds of Colchester Castle, an absurdity undoubtedly considered an excellent evidence of *gusto* and *ton* when fresh, but surely superflous next to a genuine and large Norman castle which stands on the floor of a genuine Roman temple? The most engaging of 18th cent. follies are the occasional **picturesque villages** designed and built not merely to house retainers but primarily to improve the view. Two of them, those at Milton Abbey, Dorset, and at Southill, Beds, designed respectively by James Wyatt and Henry Holland, replaced existing but uncomely and unfavorably situated villages. Two others were entirely new, the delightful hamlet at Blaise Castle in Somerset, designed for the Harfords by John Nash, and the coal-miners village on the Ellis estate, Debdale Hall, Notts; the latter, successfully combining the owner's aesthetic and philanthropic impulses, stands as the earliest industrial model village in England. Fortunately none of these had the political consequences of the most celebrated village folly, Maria Antoinette's *hameau* at Versailles. The most elaborate follies were houses meant to be lived in. Between Walpole's Strawberry Hill and P. F. Robinson's Swiss Cottage (1829-32) lie several generations of English country houses which range from the eccentric to sheer folly. The neighborhood of Bath is rich in them; the most characteristic is Midford Castle, built in the shape of a club to commemorae a killing at cards. But none can match the three most spectacular examples: William Beckford's Fonthill Abbey, Wilts, by James Wyatt, 1796-1807) which was destroyed only a few years after its completion when the colossal central tower collapsed in a storm; Ashridge, Bucks (also by Wyatt, 1807-13); and Brighton Pavilion, built by John Nash as an extravagant whimsy for George IV.

—T.A.H.

**Folsom culture.** An early American culture apparently of the last glacial epoch, at least 10,000 yrs. ago, evidence of which was found near Folsom (hence the name) in northeastern New Mexico in 1925, through the discovery of chipped stone artifacts with the remains of extinct species of animals. Knives, blades, darts, gravers and other tools of refined shape and skilled workmanship reveal a hunter people of whom no skeletal remains have as yet been found. Similar finds in other sites show a

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

wide distribution of the culture over the Great Plains area. The relation of this culture to that of the Anasazi is unknown, and a gap of some 8,000 years between the two is still to be filled. See PREHISTORIC ART; also Frank H. H. Roberts, Jr., *Developments in the Problem of the North American Paleo-Indian*, Essays in Historical Anthropology, Smithsonian Miscellaneous Collections, 1940. —H.G.

**fondant.** See ENAMELLING ON METAL.

**font.** *Book.* A set of letters, numbers, etc. But also used in another sense, as representing style of letters, as for instance when a letter of a different size or style appears in a line of print, or a word, it is said to be of wrong font. —H.E.S.

**Fontainebleu, school of.** Barbizon school. See FRENCH ART.

**foot.** *Cer.* The bottom part of the base of a vessel.

**footings.** The spreading courses at the base or foundation of a wall. When a layer of different material is used, it is called the "footing".

**force, in dance.** See movement.

**foredge painting.** *Book.* Pictures found, usually in old books, painted on the fore-edge of books.

**foreground.** That part of a scene in a painting, bas-relief, mosaic picture, etc., which is nearest to, and in front of, the spectator.

**foreshorten, foreshortening.** See PERSPECTIVE; PSYCHOLOGY OF DRAWING AND PAINTING.

**FORGERIES IN PAINTINGS.** The theory that the rise of the faker and forger of art objects coincided with the beginnings of private collecting is advanced by Riccardo Nobili in his entertaining book, *The Gentle Art of Faking*. He points out that the arts in Greece were practiced for the benefit of the state and that personal ownership of art objects was not the fashion. Architects, sculptors and painters lavished their talents in building and embellishing temples, theatres and public places where citizens came to worship, find recreation and enjoy the current productions of a living art. Doubtless much the same condition had obtained in Egypt where the artist and artisan were intimately associated in the creation of monuments of religious nature, their creations being considered as current commodities rather than objects of virtue.

It was in Rome of the Empire, rendered fabulously wealthy through conquest and plunder, that the **private collector** emerged. When the Temple of Concord in the Roman Forum was erected in the reign of Tiberius, it housed art treasures looted in conquered lands. Agrippa, Caesar, Mark Antony and Sulla assembled vast collections and Verres plundered Sicily while serving there as proconsul. It was inevitable that the lesser fry and even the soldiers should return with objects which they little understood and which quickly found their way into the hands of dealers. There existed in Imperial Rome, as in America today, a complex art world with its dealers and auction rooms, its collections and its forgers.

The revival of interest in classical culture and art which fostered the renascence of the arts in Italy awakened the collector's instinct anew. The princely collections of the Medici, the Dukes of Urbino, the Gonzagas, of Isabella d'Este, the Dukes of Milan and a host of others have not been surpassed even in our days of fabulous fortunes. It is known that Donatello, Ghiberti and others were greatly influenced by antique sculpture and that extraordinary skill in repairing and imitating these works was rapidly acquired in Italy. Imitation of paintings was somewhat retarded because few if any antique works had survived and the churchly Gothic art was not likely to be sought after by the collectors of the Renaissance. By Vasari's day, however, the deliberate creation of false works was practiced and the skill and cunning of the Italian hand has been proverbial ever since.

Through the 17th, 18th and 19th cents. the collector's mania continued to spread and with it the traffic in works of doubtful character. This traffic has flourished in periods of unusual national prosperity with its crop of new fortunes engendering a class of collectors possessed of enthusiasm and, at times, little taste or knowledge. It is interesting to note that whenever artists have been employed directly as they were during the 15th cent. in Flanders that little if any evidence of faking within the epoch exists. It is only when these works, with the passing of time, become objects of commerce that dishonest falsifications begin to appear in numbers. This seems to be borne out by the fact that today works by such masters as Picasso and Matisse are collected for high prices by the comparative few and already have been the subjects

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

of criminal imitation. Daumier and van Gogh died in obscurity and poverty, their works appreciated by a handful of friends, yet today, the collector of their works must beware. For the explanation of this phenomenon we must look into a number of places.

**Fashionable collecting** has always invited the production of forgeries. Of late years we have witnessed in this country an enlightened interest in works by the three pillars of modern American painting, Homer, Ryder and Eakins Crass imitations of these, fully signed, have already flooded the market. Earlier in this century pictures by Corot and Millet were in much favor and many worthless imitations entered collections in this country, the grandson of Millet being guilty of fraudulent imitations of this artist's works. Not long ago, in Germany, a sizeable group of forgeries, some quite clever, were sold widely as the work of Vincent van Gogh. Renoir and Cézanne have been exploited and a picture said to be by Modigliani must be carefully traced and studied before it is purchased. These painters and others in their circle are being collected and are fetching large prices today, hence their imitation is a profitable occupation. There was a time when the works of Monticelli were first-string collectors' items and imitations of them were numerous. Today neither originals nor imitations have many buyers. The forger, the unscrupulous dealer and their numerous accomplices, obviously function to supply the current demand or fashion.

**Picture dealers** have been held in much suspicion, so much so that many have come to consider them dishonest as a class. This is far from being the case—indeed, it is the exception. Reference is made, of course, to the numerous houses with established reputations and long experience with fine pictures. It is true that even with these mistakes may be made, sometimes serious ones. Generally, however, the errors concern faulty attributions, seldom involve the purchase of a completely worthless imitation. These dealers treasure their good name as their greatest asset. Many of them are intelligent and well informed and a few are among the most accomplished connoisseurs of our day. The collector who pays most dearly at the hands of a dealer is the bargain hunter with more trust in his judgment and keen eye than knowledge and good sense. There is a class of dealers specifically in business for this kind of amateur and curiously enough both parties to the bargain are usually well satisfied. There is nothing more repugnant to such a collector than hearing the truth concerning his mistake. Thus fraudulent works may remain in private possession for years and the thieving dealer continues, unexposed, in successful practice.

**Certificates** of authenticity given by oversanguine scholars frequently figure in advancing the price of pictures of average importance. The practice of writing certificates indulged in by some European museum directors and curators is frowned on by the ethical code of American museum men. In all such cases the buyer must weigh carefully what is *actually* said in the certificate. The clever use of language can frequently hide the truth concerning a work which a certificate is supposedly supporting. It is also important to know whether the writer of such a document is a competent and recognized scholar in his field. Knowledge in the field of paintings has advanced so in recent years that one would do well to secure the specialist's opinion. To all those buying names rather than works of art, however, there is no sure guarantee that certificates will infallibly produce a fine work of art.

**Provenance** or **pedigree** consisting of bills or receipts given by the artist, published descriptions in documents or journals of the epoch, engravings of works made during or shortly after the artist's lifetime, may usually be accepted if they actually refer to the picture in question. Likewise pictures which have figured in a long succession of well known collections or have appeared in important exhibitions may be credited. Here again the utmost care must be taken to assure the common identity of the works so known with those being studied.

**Family tradition** is rarely dependable unless it is supported by documents. Word of mouth statements passing from generation to generation are generally suspect. So frequently an indifferent copy of an original by Gilbert Stuart made, let us assume, in 1850, becomes by 1900 one of his own. In such cases only knowledge of the artist's painting habits, his canvas and color, should determine one's opinion. Many such inaccurate statements are made quite honestly by owners but some are deliberately fabricated to deceive the inexperienced. Worthless portraits supposedly by good early American painters have been planted in apparently respectable families and sold for important sums. Many times these pictures change hands so frequently before being "placed" that the fraud is well nigh impossible to trace. It must be borne in mind also that

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

we have no laws in this country designed to punish such frauds.

**Deliberate forgeries** may be classified as imitations of an artist's work made with the intent to deceive. They must be distinguished from imitations made honestly by a master's pupils, by copyists or mannerist imitators. The van Gogh imitations referred to earlier were deliberate and criminal forgeries. Such forgeries are usually signed with a carefully faked signature. They attempt to reproduce the artist's style, his drawing, his color and his materials. The most clever ones are made on an old foundation so that the fine crackle of age will be found upon close examination. They are at times made up of motifs taken from several sources within the master's production put together skillfully to appear as plausible originals. Their detection will also depend upon a study of the art forms themselves. Imitators intent upon reproducing the "style sensation" of a picture will rarely understand the basic forms, and mistakes in construction will stand out to proclaim the forger. Early works imitated on old grounds can be detected by use of **photomacrographs** of 2½ x to 3 x. With this magnification the fresh paint film can usually be seen extending over unbroken pigment as well as between the old separations. Such superimposed paint is necessarily more recent than the foundation. True **crackle** in old painted surfaces causes a definite interruption, the cracks extending through to the support. Less accomplished forgers will attempt to create the appearance of age artificially. The fine crackle can be produced by varnishing a paint film before it is completely dry or by exposing it to heat. In such cases the crackle will affect only varnish and paint film. Still clumsier forgers have attempted to paint the fine crackle over a freshly painted imitation. Only close inspection with a glass is required to detect this common practice.

**Old copies and imitations** frequently figure as forgeries years after they have been honestly produced. Students in all epochs have endeavored to emulate their masters to the minutest detail. Copies and imitations so created have at times been modified, signed and given faked pedigrees or declared newly discovered works. In many ways they form the most plausible class of forgeries because they have the authentic appearance and their materials are of the epoch. In such cases stylistic comparisons of line, form, colour and technique will aid in detecting which is a copy or imitation and which the original. Knowledge of the artist's style is essential but technical aids in the form of photomacrographs, radiographs and infra-red ray photographs will be found useful in checking and amplifying one's visual examination. The procedure is to assemble a group of such documents from unquestioned works by the master under study. By comparing these with similar material taken from the questioned work style differences will emerge and plausible conclusions can be reached.

**Modern copies and imitations of old masters** offer less serious problems. The professional museum copyist has never been a familiar figure in our museums. Such pictures, mostly produced abroad, find their way to auction rooms and smaller antique shops where they are bought for decorative purposes although, at times, an unlucky purchaser mistakes them for originals. These works can be recognized by examining their materials, canvas or panel and their manner of execution.

**Copies and imitations of contemporary work** are more difficult to detect because many of these are made to deceive and some are quite clever. Fortunately one encounters such pictures seldom although the danger is ever present. The best counsel to the collector is to secure competent advice and to remember that good pictures by celebrated artists have their price. He should beware of "recently discovered" and "unknown" paintings found in out of the way places. Such works, offered at small prices are seldom genuine.

**Signatures** on pictures are not positive proof of authenticity. Indeed a large percentage of artists in the past failed to sign or identify their pictures in any way. Genuine signatures are usually an integral part of the paint film. When added over old painted surfaces, the writing will interrupt and fill the fine cracks characteristic of old paint films. Such signatures, apparently lying upon the surface are suspect. The validity of the signature can be accepted only when the style of the picture is clearly that of the artist. Dictionaries listing names of painters and giving various known forms of their signatures are useful in checking one's conclusions but they do not furnish final evidence, because, obviously, forgers have access to them as well.

**Modified fragments** constitute a well known class of pictures masquerading as completed originals. This is a large and deceptive group of forgeries because at least a portion of such works is original. Incomplete works, sketches and partially damaged pictures are often completed or modified to increase their desirability

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

and value. Unscrupulous dealers and clever restorers are at fault here. This practice was widely used in the last century and many a *pasticcio* of this kind has remained undiscovered in private and public collections. The experienced eye will be able to detect such modifications by the presence of *pentimenti* which do not function with the drawing, brush work or composition of the picture but he may not be able to positively state the extent of the changes. The x-ray is the most useful means of detecting such additions. At times infra-red and ultra-violet ray photography will aid but these results are not always clear cut.

**Modifications by the artist** must be recognized as distinct from the subsequent changes of restorers. These are legitimate and their treatment in restoration constitutes a special problem. They do not affect the value of a painting and often furnish instructive clues to the artist's methods.

**Repainted "wrecks"** are old pictures which have survived in a state of delapidation and have, by clever restoration, been reborn. Many times the extent of original paint film is less than 10%. This fairly large class of forgeries are worthless except as study pieces. Here again, the x-ray and the infra-red ray photograph will furnish positive evidence of condition. Because varnishes have a fluorescence of their own, the ultra-violet ray lamp is less useful.

**Reproductions, photographs, prints and drawings** have also been used as foundations for forgeries. As a class, they are not especially clever nor are they too difficult to recognize. The paper support of coloured reproductions is removed so that the printed surface alone remains. This is then mounted on canvas and care taken that the weave of the fabric shows through on the face of the print. Varnishing and artificial ageing finish the product. Much the same process is followed with prints and drawings although these must be colored with glazes before being varnished. When such works are encountered they will arouse suspicion by their flat, papery appearance lacking the slight relief and varied surface texture of an oil painting. Examination of the edges of the picture will provide further proof. A warning should be noted lest all oil sketches on paper be suspected. Artists of past times and of our day have utilized paper supports, despite their flimsy and temporary nature, to produce sketches and informal experiments.

**Interpretation of technical photographs** correctly is of utmost importance in study of style and hence in deciding between the master's work and that of the copyist. Radiographs record the substructure of a painting produced with pigments dense enough to impede the passage of x-rays. The denser the pigment the greater the clarity of the shadow cast. Since white and many light pigments contain lead, a material impervious to x-ray, it follows that their shadows in pictures will be recorded with greater clarity than dark areas in which lead pigments are absent or exist in smaller proportions. The shadowgraph will, therefore, give only an approximation of the visible surface conditions. This approximation will approach the truth in heads and hands where a larger portion of white is used. Such areas furnish valuable clues on technique and work habits which are personal with each artist. The modern copyist will reproduce only the surface characteristics of a painting, not the master's own personal habits of work. These are more likely to be known to pupils of an artist and their copies or imitations are therefore more convincing. This is the case with works of painters in Rembrandt's circle, many of which are or used to be attributed to the master. A sufficiently large group of radiographs by a given artist will establish a performance pattern which is apt to be conclusive and shadowgraphs which do not belong in the pattern cannot be accepted as his work. All technical photographs are only aids in enlarging one's observation and recording it for future comparison. The popular belief that these do away with the need for connoisseurship is, of course, erroneous. To be useful such photographs must be compared with one another and with the work of art so that a logical chain of reasoning can be evolved. **forlana, furlana.** A lively Italian dance in 6/8 or ó/4 time.

**form** (L. *forma*). In general, mode of arrangement; structure; order; organization. (1) In comparative aesthetics, and in regard to any art: (a) Mode of arranging or coordinating the factors in a work of art. As distinct from the physical form of the object, its **aesthetic form** is that arrangement of details and meanings which can be either directly sensed and verified by other observers, or demonstrably assigned to it on the basis of established cultural usage. For example, the form of a poem includes patterns of word-sounds and also established meanings of words. (b) A particular type of such arrangement; especially, a recognized, conventional type such as the sonnet or sonata. (2) In visual arts: shape, especially solid shape; as in the statement that line, form, color are elements in art. (To avoid confusion with sense (1) a, the term **shape**—linear, surface, or solid shape —is preferable). —T.M.

(3) For dance to exist as an *art form,* movement must be associated with imaginative content and mental discipline. This necessity presents two phases belonging to its art form. One of the unseen, **inner dance,** which is the organization of the mental attributes into content; the other is the outer **observed dance,** which is the result of the organization and execution of the motor elements. When the fusion of inner subjective experience and outer objective motor experience is attained, form in dance is achieved in its fullest meaning as *art form.* The observable form as art form is, therefore, biologic and organic, for it is an extension of inner conditions into their expressive form. In the last analysis the term "form", in all its implications, means the organization of constituent elements into a defining characteristic appearance by which it is known. —M.N.H'D.

**form: a philosophical analysis.** During the two millennia of European thinking about art this term has acquired so many meanings, and such confusing ones, that order will have to be brought out of chaos by applying some scheme of classification.

A. *Form as an ontological category.* (1) **Platonic form.** The form of a particular work of art is the idea, the essence, the prototype which is made perceptible in the work of art. (a) It is perceptible in what the work of art is *about.* The prototype of a chair is made visible in the painting of this or that chair. What is usually called content (or matter) thus becomes the locus for the idea, the form. This is roughly the standpoint of the **aesthetics of content.** (b) The idea of form that becomes perceptible is not this or that idea, but the idea of the beautiful in general. Its locus is not the content but the composition of the work of art, the law of order ruling over the parts that compose it. (c) There is no reason why these two formalisms of form and content should not be joined and the work of art defined as the beautiful representation of a prototype, beautiful here meaning a representation in terms of the Platonic idea of beauty. (2) **Aristotelian and pseudo-Aristotelian form:** Form as entelechy of matter. (a) Form and matter do not exist separately; they exist only as formed matter or mattered form. According as one understands by matter in art the artistic medium (colors, sounds, words, etc.) or the subject matter, form means the entelechy of the medium, or the entelechy of the subject matter, or both.

This corresponds to T. M. Greene's distinction (made in an un-Aristotelian context) between aesthetic and artistic form. **Aesthetic form** lies in what Prall calls the aesthetic surface and is the relationship established by the artist between the ultimate sensuous data that constitute the artist's medium. **Artistic form,** on the other hand, is this aesthetic form, now not taken as an end in itself, "but also, and essentially (as) a means, in fact the only means, whereby the artist can express himself and communicate his ideas to others." According to Greene, artistic form, as "means to the end of significant expression" "is the *peculiar* locus of its (the work of art) artistic quality."

Returning now to form as entelechy, form in art is somehow in between the useful form that is imposed by man upon indifferent material—as for instance in the case of human tools—and the biological form that develops from inside the matter itself. With respect to these teleological relationships see Kant's *Critique of Judgment.* (Cf. also Dewey, *Art as Experience,* p. 116.) (b) By a process of crass substantialization, form and matter become substances themselves, subsisting independent of each other like soul and body, and brought together by fate or force to constitute another more complex substance This view can easily be adopted by Platonists. What was the form, before it was joined to matter? An idea, or perhaps better, the vision of an idea. This vision, however, is a vision in colors, or in sounds; it is itself a hylomorphic thing.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

The accent can now be shifted upon this vision and the translation of the vision into real matter becomes the task, artistically rather irrelevant, of what Croce would call mere technique.

B. *Form as instrument of aesthetic analysis.* Form and matter are mere instruments of analysis. The scalpel and retractor with which we dissect human bodies are not themselves parts of the body. Similarly our concepts of form, matter, etc. are merely operational devices; they are no real parts (nor even moments) of the work of art. The same thing viewed in one perspective is form, viewed from another point, matter—just as one and the same nervous process is, for the biologist, a chemical process, for the psychologist, a psychological process

We cannot discuss this view. It is suspicious, however, that even where form and matter are regarded as mere concepts of analysis, they tend to take on again a definitely ontological meaning. Cf. T. M. Greene, *The Arts and the Art of Criticism,* pp. 123, 126, for whom form, matter, etc., are categories of analysis.

C. *Form as a principle of classification.* Works of art are grouped according to similarities. The characteristics wherein they are similar are abstracted from the rest and lead to the establishment of classes. The interest guiding these abstractions may be either systematic or historic. The systematic abstractions lead to such formal concepts as epic, novel, drama, comedy, etc. The characteristics which were basic in making up these groups are easily turned into normative concepts. Every good epic for example, must be written in the form of alexandrines, these alexandrines themselves must have a certain form, etc. It is in this sense that academicians are called formalists.

The historic interest leads to classifying works of art according to stylistic characteristics (see style). The form of a work of art here consists of all those characteristics that show the work or art to be of a certain period, of a certain country, of a certain painter, etc. (Cf. Woelfflin, Panofsky.)

The systematic forms are supposed to be "right" at all times and in all places. The beauty of which they are the *conditio sine qua non* is thought eternal. The historic forms, on the other hand, are relative to place, time, and race. They are called beautiful only as they give expression to the unique spirit that created them. —W.C.

**formal balance.** See balance.

**formal poetry.** See POETRY.

**formalism.** Indicates the use of those transcendent forms by which all form is achieved; i.e., the translating of any subject matter into a thing which may be perceived by the senses.

Besides this transcendental meaning there is the meaning in art of form which is sensually perceivable but which has become divorced from its content and which has no longer any relation to it. Form itself is important only because of its relation to the subject which is to be formed and to which it stands in a certain organic kinsship. But if one dissolves this relationship with the content or annuls the organic partnership, then form without content is the result, and that is the exact meaning of formalism. In some degree formalism may be compared with governmental inefficiency in which governmental functions are no longer related to the things which they govern, and the relation between them has become only a formal function, not an organic one.

In art this kind of formalism is used by persons of critical mentality, who know that a certain content is the basis of each form, and who have in addition an imitative ability which makes use of this knowledge to imitate forms, to make the spectator believe that the content is really expressed by the form. Therefore formalism always means the illusion of something which is not really there. This deception can be achieved either unconsciously by those with a lack of spiritual substance and an abundance of ability for formal expression or consciously with the intention of creating effects by means of forms behind which there is an insufficient fund of substance. This deception of value by means of empty forms, or form husks, is only possible when the spectator has an inexact or superficial feeling for form. In reality, empty form never can be the same as form filled with substance, because between substance and form there exists a relation which cannot be broken, so that neither can be mistaken by the keen observer.

Formalism plays a great part in epochs that terminate a cultural period in which the substance of feeling is at a low ebb and the emphasis on form over-developed. —A.J.S.

**formal script.** See writing.

**formant, formant regions.** *Mus.* A dominant group or groups of adjacent partials in a tone spectrum which gives character to a rich tone. A sound may have one or more formants. It

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

is largely in terms of the number, location, and relative dominance of the formants that we distinguish a voice, an instrument, a vowel, or any other sound from another.

The characteristic of a tone, such as an *o*, an *a*, or an *e*, is revealed by the number and location of the formant regions usually from one to three in a rich tone. Thus there are characteristic formant regions, for each vowel in music or speech for each solo instrument so that one can distinguish at a glance a clarinet tone, a flute tone, a violin tone, or the tone of a bassoon in part by this. A pure tone has only one partial, a fundamental. A rich tone may or may not have a formant or a formance. —C.E.S.

**format.** *Book.* In French, size only; but also size, shape, style, etc., in English.

**forming of pottery.** See CERAMICS I.

**form, in music.** (1) Opposite to extra-musical content or subject matter. (2) Sum total of relationships among consecutive elements of a composition insofar as such relationships are relevant factors constituting the coherence of the composition. The elements in question may be simple (motifs, phrases, themes), or complex (sections, movements). The relationships in question may be identity (literal repetition), similarity (variation, allusion), or heterogeneity (contrast).

Set forms (sonata, rondo, etc.) are generated when certain types of relationships are applied to certain types of elements by numerous composers in a typical way over a considerable length of time. —E.K.

**formism, formists.** See POLISH ART.

**fortifications.** Any works constructed for the purpose of military defense. Early fortifications consisted primarily of a parapet and a ditch.

**forum.** See ROMAN ART.

**forwarding.** *Book.* The stage of a work on a book between sewing and tooling, etc., including rounding, backing, putting in boards, etc. See EARLY BOOKBINDING AND FINE BINDING.

**foundation.** A structure upon which something is erected, as a building below the surface of the ground, or the portion that constitutes a base; sometimes, a platform, on which the upper portions rest. —J.M.M.

**foundation weaves.** See weaving.

**founding.** The art of melting and casting.

**found object.** See object.

**found object assisted, interpreted.** See object.

**fountain.** A natural or artificially produced jet of water. Architecturally, the structure or basin, often embellished, through which the water flows.

**four attributes of the scholar.** See SYMBOLISM IN FAR EASTERN ART.

**four gentlemen, the.** See CHINESE ART.

**four leaf motif.** Also called quatrefoil; a decorative ornament having four lobes or foils with either pointed or rounded ends; the pointed form common on Greek pottery, sometimes hatched.

**fovea centralis.** See COLOR.

**foxed.** *Book.* Discolored; spotted. The term is generally used to describe the yellow spots left in paper by damp.

**fractional concept.** A perspective or conception involving visual description of an object as a combination of different parts rather than as an organic unity; found in early or primitive art forms.

**frame.** In the sense most commonly applicable to art, the word frame is primarily used for a construction of wood, metal or other material forming an enclosure or border around a work of art, such as a painting, relief or stretched tapestry, etc., to provide a neat or ornamental finish around the work, to isolate it from its surroundings or to harmonize it with them, and serving as well as a protection and often as the means of attaching the work in its appointed place.

In one aspect of its use the frame is a device for setting successfully a painted or sculptured picture or ornamentation into its architecturally appointed place. In this sense the use of moldings to set off elements of a building has relation with frames. Related also are borders such as occur in wall paintings in Pompeii and Herculaneum, in mosaics as there and at Antioch, and later in mediaeval Italian churches, as at Ravenna and Rome, around decorative medallions as in Coptic textiles, in decorative bands around a page of manuscript or in connection with miniatures in manuscripts of the Middle Ages, or in mounts for ivory carvings and enamels as in mediaeval reliquaries and book-bindings.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

In modern usage a frame usually is thought of as a constructed device for holding in place, protecting, and presenting appropriately for inspection a painting, a mirror or the like, and it may or may not have architectural relation with the spot where it serves. The tendency has been toward less and less architectural relation with the environment, as, during the development of European art, the painting has become increasingly an independent, studio product unrelated to its probable setting, and important in its own right apart from any decorative or other purpose it may serve. Naturally, frames have reflected dominant styles of decoration of the period in which they were made.

The earliest use of the frame in a way approximating modern usage is contemporaneous with early painting in Europe. The structures holding in place the multiple painted panels of saints and sacred history used in churches and chapels in the medieval period, and, as the Gothic period progressed, repeating as ornament some of the crockets and finials used in architecture, are the earliest, and authentic examples are rare. They still are close to architecture, have usually been designed, like the paintings they enclose, for a specific space. The reredos (q.v.) of chapels and churches, set with painted panels, used in medieval times and finding elaborate and complex expression in Spain and Latin American countries into the 18th cent. are more complex, but thoroughly architectural developments of the frame.

The Renaissance used the frame and developed it in accord with modern practice, apart from any architectural connection, from the 16th cent. It took on size, weight and baroque decorative elaboration in the 17th cent., became more delicate and detailed in common with each change of style and taste in the 18th cent., reflected classic influences and used classic motifs at the beginning of the 19th cent.

Until the 18th cent., though the frames were often of other materials—for example ivory, silver, ebony, tortoise-shell, etc.—the principal material employed was wood, carved, and then usually gilded. The finest craftsmen (e.g. Grinling Gibbons in England) frequently turned their hand to carving frames and examples exist which are as fine in their expression of the time as the works they enclose.

In the 18th cent., in the effort to meet the demand for cheaper frames than the hand-carved type, a composition, which could be molded to imitate carving and then gilded to resemble the solid wood frame, was perfected. From that time on only rarely have competent wood carvers worked on frames. The composition type frames, still produced, flourished in abundance, and in great size and weight as in brilliance of gliding, through the 19th cent.; and the heavy gold frame, sometimes somewhat eclipsing the work of art it enclosed, was a characteristic interior decoration of the Victorian home. For the most part these frames reproduce 18th cent. designs, and have been widely responsible for the persistence of this style of decoration. In the late 19th cent. Seurat experimented with frames painted in harmony with his pictures, and many contemporary artists design, and sometimes also make, their own frames. The classic paintings of modern art, impressionists, Cezanne, etc. are most frequently sold by the dealers in old 18th cent. frames, preferably of carved wood, but sometimes of composition, from which the gilding or a great part of it has been removed with caustic, and which, as a result, are of an unassuming neutral color and texture flattering to the vividly colored works they enclose. Today, some artists use old frames similarily treated, or refinished to their taste, design their own frames, or even entirely omit frames. The frame has, however, a functional purpose in protecting the painting in handling and providing a convenient and solid material by which it may be attached to the wall. A few designers have made frames of modern materials used in modern ways for a decorative purpose, but generally speaking, the functional aspect of the frame prevails and even commercial framers offer honest milled moldings of varied and fairly simple profile for the public choice. Contemporary paintings, which are often painted as much for exhibition in galleries as with their possible eventual place in a home in mind, have special need of frames for protection in shipping, handling and hanging. From this point of view, simple frames, harmonious, but not too distracting or insistent in color or tone, without composition protuberances likely to be knocked off, and placing the principal emphasis on the work enclosed, are the most satisfactory. Such simple frames perform their functional purpose, and, at the same time, their aesthetic duty of isolating the painting from its background, of setting it off from competing and disturbing details, and of directing attention discretely to it. —G.L.M.M.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

**frame of reference** See AESTHETICS, RECENT TRENDS IN (1).

**frames.** A technical term referring to the Brussel loom—the number of worsted pile threads which pass through each dent of the reed.

**framework chair.** See FURNITURE.

**francaise.** A French dance in triple time.

**freehand drawing.** See drawing.

**freehand perspective** See PERSPECTIVE.

**free-standing.** Term used to characterize a carved figure or column which is not attached to or part of a background or wall.

**free-stone.** Stone which may be easily cut or shaped into blocks and worked with a chisel; so called from having no grain; it may therefore be cut in any direction.

**free verse** (vogue in U.S.). Poetry without a fixed metrical accent was introduced into the U.S. by McPherson's Ossian, whose Celtic cadences were imitated extensively after 1783. Whitman's poetry gave impetus to the movement for unshackling verse from traditional metrical patterns. Thoreau, Margaret Fuller, Emily Dickinson, Stephen Crane, and others deviated from classical formulae but it was not until the new poetry movement of 1912 that organized resistance to tradition succeeded in enfranchizing non-metrical verse. Ezra Pound and Amy Lowell, the proponents of imagism (q.v.), as well as the magazine *Poetry,* defended the new form. Much experimentation in the following thirty years led to a discovery of undreamed richness in the musical use of language. No poet remained unaffected by free verse, although a tendency appeared by 1940 to return to formal patterns and to achieve these new effects within prescribed limits. See L. Untermeyer, *Modern American Poetry,* 6th ed., 1941; Amy Lowell, *Tendencies in Modern Am. Poetry,* 1917. —H.R.W.

**freeway.** See CIVIC PLANNING.

**FRENCH ART.** There was no single center of art in France during the Hundred Years War (1339-1453) and consequently no school that inclusively represents the French temperament in art. In the early 15th cent. Charles VI (1380-1422) was banished from Paris to that part of France that is bounded by Touraine and Champagne. Moulins, Tours and Orléans all played their parts in art production but it was at Bourges that Charles VI and Charles VII (1422-1461) patronized those artists that went to make up the **school of the Loire,** or as it is sometimes called **Touraine.**

The Burgundians, who had allied themselves to the English, were the sovereigns of both Flanders and Burgundy and at Dijon encouraged the art genius principally of Flanders and Holland. In the south (Provence and Languedoc) the Popes, during the "Babylonian Captivity" at Avignon, in need of religious decorations, were naturally more predisposed to the Italian temperament and employed many Italian artists preponderantly of the Siennese school. Although the captivity ended in 1377 Avignon and Aix continued their tradition as great centers of art. It was only toward the end of the reign of Louis XI (1461-1483) that France was once more united and French art began to harmonize its scattered influences. The Franco-Flemish school gave to French art its precision, force and dynamism, its preoccupation with realism, its color and its sense of linear form. From Avignon and Aix the spirit of Italian classicism manifested itself in the close-knit composition of Giotto and the three-dimensional qualities of Massacio. The generalized idealism of humanism unloosed in French art the tension of Flemish angularities and heavily detailed masses. The regal court of central France south of the Loire, deprived of imported foreign artists for so long a time, retained the Gothic feeling of 'infinity' and an inchoate naturalism that finally became one of the leading elements in the international style of all Europe. In Provence (Avignon) Froment of Avignon, Jean Perréal and even Jean Fouguet (1415-1485) emulate certain Italian qualities: Froment, a linear delicacy, Perréal, a bi-symmetrical decorative element, and Fouquet a close-knit order not to be found in former miniature painting. But these three men, over and beyond their northern and southern influences, began to express the French spirit of elegance, taste and particularly that balance of northern, formal precision and southern formal idealism. While the Franco-Flemish art of the north was producing masterpieces by the Van Eycks, Van der Weyden, Bouts, Memling and Massys, Jerome Bosch, Van der Goes and a number of anonymous workers, and while Avignon and Ville Neuve had epitomized their great work in the justly celebrated Avignon Pietà,

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

the school of Touraine was still laboring under the handicap of isolation from the dynamic art trends about it.

Image makers (**Imagiers**) were turning out sacred statues in ivory, stone and wood, and the book illuminators inspired by Pol de Limbourg and his followers were still working, to some extent, in the spirit of Medievalism. Following the abortive Italian ventures of Charles VIII, Louis XII and Francis I, Italian art became the ideal of the French ruling class, and under Francis I a number of Italian artists were invited to France, among whom were da Vinci, del Sarto and Cellini. Later (ca. 1530) Rosso the Florentine and Primaticcio were engaged to make the decorations of the King's palaces. Their French admirers founded the **school of Fontainebleau**, which is generally regarded as Italianate, but it was in this school that French genius finally asserted itself.

Italian elements can be distilled from most of these anonymous painters, but these elements are no more than tools with which the French temperament carves its own likeness.

In the 16th cent. the sculptor Michel Colombe (d. 1512) was still unemancipated from Gothic conceptions; Germain Pilon and Barthelèmy Prieur, chose Italian guise and Jean Goujon, one of the glories of all French sculpture, used certain Italian details and even the Michel angelesque "hole and bump" postures, although very French in flavor and conception.

Throughout the French progressus there is apparent a facile solving of the most weighty problems presented to the painter or sculptor. The French artist, seems never to labor over his work; there is a smiling and almost offhand acceptance of life. With the Flemish or Italian artist life as expressed in their art is a serious business; in the north we find problems that become burdens and one feels that he is imprisoned by the mere handling of his brush. In the south, idealism of form, never obscures the pathos, the histrionic drama, the struggle, maternity and martyrdom he depicts, and even in classical legend there is serious concentration on the figures of the myth that his color and composition mastery only served to intensify.

The final establishment and unification of French traits in art of the 16th cent. prefigured the strong French state of Louis XIII (1610-1643). In spite of the fact that French taste in the first part of the 17th cent. was for Italian eclecticism even the French artists who lived and worked in Italy could not divest themselves of their racial traits. Jean Cousin, called by some the founder of the French school and by others a degraded imitator of Italian decadence, was in his lesser sphere as French as Poussin or Claude. Jacques Callot (1593-1635) a caricaturist and depictor of beggars and soldiers inaugurated a type of art in France that was the foundation on which Daumier, Guys, Gavarni and even Toulouse de Lautrec and Foraine built. The brothers Le Nain, using the contrasted and heavy light-and-shade method of Caravaggio, (the artist of the Counter-Reformation) depicted the genre subjects of the downtrodden peasant and the earth's humble. These artists mark the first ripple of the French revolution still a century and a half in the future and are the prophets, sired by the religious wars of Henry III and the waning power of the nobility, of the coming ascendancy of the Commune. In 1648 this tendency was thwarted by another authoritarian movement. Mazarin and Colbert founded the French Academy, an institution based on the intellectual concepts extractable from the Italian painting of the High Renaissance. Needless to say, the effort at making geniuses by means of laws was abortive, and although under Louis XIV there are a plethora of well-known names, there are few indeed that add substantially to the glories of French art.

Le Brun became professor in the Academy in 1648 and its director in 1683. A veritable czar of aesthetics, he based all instruction on the suggestions of his friend Poussin, after having submitted them to a sort of Cartesian tribunal. The geometrical and mechanist approach was the desiderata of this strongly intellectual and purposeful professor, and the belief is held that he suborned all the talents of his time. As a matter of fact, such an authority was sorely needed by the artists, who, in being liberated in too quick succession from mediaevalism, the authority of the Church, the guild system, feudalism and Italian art would have lost themselves in the by-ways of idiosyncrasy before their wings were strong enough really to fly. As a foundation for art creation the Richelieu-Mazarin-Colbert-Le Brun Academy was worthless but from the bureaucratic standpoint of raising insignificant men to the level of craft capability and setting a technical goal as an ideal, it was salutory. The fact that it had no place for originality or genius only proves that all institutionalism must be considered as a breeding place of mediocrity; genius

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

pays it no subservient respect, it simply ignores its existence.

In Le Brun's own work we see a strong man of exceptionally expressive talent, working in the service of his monarch, using a style wherein exact proportions and voluntary arrangement form a minutely measured-out appearance. His drawing was meticulously sincere in what he erroneously imagined was the Grand Style of the Italians, and his composition was a feeble approach (insensitively based on the mistakes of Poussin) to the Italian High Renaissance conception. His contemporary and follower was Le Sueur, a more Italianized imitator and a lesser man intellectually, though just as artistic a one. Hyacinthe Rigaud added a factitious pomposity in his portraits and shows all the numerous faults that can accrue when inferior artists take themselves and their ideas too seriously. With Largillierè we have a tendency toward a greater freedom in drawing and while still enslaved to the superficies of monarchial taste, he nevertheless has a grace and a litheness that marks him of the French tradition of Greuze, Watteau, Ingres and Renoir. The two great painters of the day are Poussin (1594-1665) and Claude Lorrain (1600-1682). Poussin was a highly cultured man who spent the greater part of his life in Italy for the purpose of study and inspiration. He never quite sounded the depths of Italian art in spite of the recipe books of the Italian guilds, the *Poetics* of Aristotle or of Bacon's *Essays on Learning*. His composition is elementary, generally little more than balance; his color is unattractive but his drawing is highly correct and even sensitive. The landscapes in which he places his figures, have, relatively speaking, an organic relationship to these figures and while the emulation of Le Brun's work is the usual achievement of the best French academicians, the art of Poussin is their unattained ideal. Lorrain is a painter through his wonder at and love of light. Landscape is his forte, and even today his pictures, while less actual than those of the impressionists seem more lastingly luminous. Such a treatment of nature as a theatre in which all the rôles are played by light, link Lorrain to such masters as Rembrandt, Watteau, Turner, Monet, Vermeer and Cuyp.

In the sculpture of the 17th cent. we find, besides a vast number of magnificent portraits, several men of genius. Perhaps Puget and Girardon are its greatest examplars. Pierre Puget was passionately enslaved by the tortured soul of Michael Angelo and sought to express in large masses, that movement and tension that the Florentine master employed to exteriorize and formulate his inner psychic struggle. There is force here and the drama of the lonely man who shuns the too easy answering of life's questions and yet at the same time the facility and the verve that brand him French. Girardon both as a portraitist and the sculptor of the bas-reliefs of Versailles shows his mastery of form, grace, and material. His handling of the nude foreshadows both Ingres and Renoir in its drawing and is as French as Mignard and Fragonard.

Coysevox and his pupils the Coustous, are more naturalistic in a diluted classical and decorative sense, but energetically worked to found the academic ideal. This ideal looked upon Bernini as a great man and its pre-occupation with the baroque was leading it to the *cul de sac* of insignificant clock ornamentation so prevalent in the French salons of the 20th cent.

In spite of monarchial authoritarianism, Colbert and the French academy, the 18th cent. was Jansenist and masculine. The first great artist of this revolutionary era was Antoine Watteau (d. 1721) who turned to Rubens for his inspiration and tools. One might say his art was the French visage reflected in a baroque Flemish mirror. On him devolved the pleasure of depicting the lighter moments of the court circles, in glowing colors, flowing lines of movement and bathed in an all-encompassing light only equalled by Lorrain. This subject matter was an escape from the vacillating political economy of Louis XV and a summation of ideal condition in contrast to the poverty and oppression of the French people. Watteau all unconsciously, with Boucher and Fragonard, Lancret and Peter was a propagandist for the Revolution. Here was too much pleasure and beauty that belonged to one class while all others were engaged in a life and death struggle both at home and on the battle front. Voltaire, Montesquieu, Rousseau and D'Alembert opposed everything for which the Court stood while Watteau distilled, through sheer delight, all the Elysian happiness that he felt could be man's inheritance. His philosophy was as limited as that of the Trouvères of an earlier day or of his opposing contemporaries, but his art is a magnificent expression of the stable qualities, fundamentally unaltered by transient upheavals, of the French temperament. Here began the modern expression of a romantic-

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

ism whose earlier expression in the school of Fontainebleau took the classical myth as its theme.

J. B. Chardin, the other great artist of the 18th cent., also looked north for inspiration. His point of view was diametrically opposed to that of Watteau. Interested in genre like the Dutch he painted the homely things of the middle class domicile; single figures, interiors and particularly still-lives. A realist, so-called, he was an artist dedicated to formal values which included chiaroscuro, texture and the minute study of light effects. From this standpoint and on this limited ground he was as expert as Rembrandt. It is unfortunate that the late 19th cent. student, instructed by the official schools, should so miserably have misunderstood Chardin's work as to have made of him an authority for the *trompe l'oeil*.

Rousseau's influence on Diderot made him inveigh against the voluptous implications of Watteau and threw him into a trap of moral issues where he found Jean-Baptiste Greuze. This artist was the great 'story-teller' par excellence, a calculating and opportunistic soul whose mask was a didactic uprightness and sympathy with the people, but whose real message was a weakening sensualism far beyond that of a frankly licentious Boucher. Greuze banalized Chardin in much the same way that the 'jazz style' decoratively popularized cubism, but unlike the interior decorators of our day Greuze, as a painter, is by no means insignificant. It took a world shattering revolution to divorce him from the mawkish esteem of the public.

Thus during the 18th cent. there appeared four tendencies in the art of France. Watteau represents the nostalgia of idealism with textural, atmospheric and voluptuous beauty as its supports. Chardin is the formalist, the actualist, whose significance in the new outlook resides in his ability to make art of the materials that have no specific claim to beauty per se. The third approach is by way of playing to the bourgeoisie and the proletariat. Its methods are unimportant, its subject matter is everything. It has a literary basis that elevates itself sporadically in the progressus of all the arts, not only in France but universally. The fourth tendency is that represented by Jacques Louis David. His was a revolt against the other three; an art concocted for the soldier of Napoleon as well as for the fanatics of the Reign of Terror. A cold and aloof draughtsmanship, (it is difficult to conceive of his work as painting) he had a correctness unequalled even by Le Brun. He was dessicated by political theory and the too-long observations of Greco-Roman sculptural copies. He stems from the archeological enthusiasm of Winckelmann rather than from the vivid and viable paintings of the Renaissance and his work became the final rallying point for the now dominantly vocal distrust of the revolutionaries for all that had gone before them.

Sculpture of the early 18th cent. retained the correctness and dignity of Louis XIV and followed the traditional convention of the Coustous. Le Moyne and Falconet are representative of this serious academic effort, but two other artists arose to eclipse them. Pigalle was a vigorous artist with a great understanding of the antique which he applied to portraiture in a striking and epic manner; Houdon, better known in this country, was less classicist than realist. His handling of the human form is sure and penetrating and yet he instills a grace and order that could only come from sounding the depths of Hellenistic principles. Clodion (1738-1814) or Claude Michel was the boudoir sculptor par excellence. Using terra cotta for greater freedom in modeling he produced a multiplicity of statuettes which, while bordering on the licentious, are replete with excellent observation of realistic form. One might say he translated Boucher into formal naturalism and not be far from exact.

David became a political figure; was selected by the Revolutionary Assembly as the official painter of the Commune, was later popularized by his Napoleonic illustrations and after the return of the monarchy was exiled. Raphael Mengs in Rome and Vien in France were instrumental in David's development but to him is usually given the credit as the founder of the **Neo-Classical school.**

Jean Auguste Dominique Ingres after eighteen years returned to France from Italy in 1824 and became associated with the Neo-Classicists. One may be sure that his leadership of this school was more in the way of a protest against Delacroix than a feeling of relationship with the spirit of David. Both he and David were inept at compositions in which more than one figure was painted; both painted magnificent portraits. But it is to Ingres that we must turn when great draughtsmanship is in question. No matter how flat and thinly decorative might be his actual painter's technique, his drawing sets him in the forefront of the greatest portrait-

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

ists of occidental art. His line is tenuous, melodic and very sure and it is to the study of Ingres' drawings that we owe the draughtsmanship of such men as Degas, Renoir, Matisse and other lesser artists. He synthesizes his models by the abrogation of every nugatory protuberance and arrives at the essential form with never-failing and sensitive acumen. While using the material means of neo-classic ism, Ingres was at heart a romantic, and it was perhaps, the consciousness of this, to him, shameful tendency, that made him so intolerant of his more straightforward contemporaries. Among these Girodet had most of Ingres' faults and few of his undoubted virtues. He, too, was a romantic in spirit inspired by literary imitations of antiquity. But it was the work of Baron Gros that inaugurated romanticism, one of whose dicta was the depiction of the topical. Prud'hon, a student of Correggio, extended Gros' technical means into the realms of closely-observed, logical chiaroscuro, which at times used a rich color ensemble for its effect. His subject matter, however, never escaped the classical.

Gericault takes up the subject matter of Gros and uses the three-dimensional lighting of Prud'hon and it is in his great picture *The Raft of the Medusa* that romanticism shows itself in full swing. The leader of the romantic school is undoubtedly Eugène Delacroix. Having studied the Venetians, Rubens and Gericault (from all of whom he absorbed qualities relative to his genius), he began to paint subjects that mark the high moments of many literatures. Byron, Shakespeare, Dante and the Bible, the Greek revolt against the Turks and the French Revolution,—all furnished him material for his brush. He made a study of color-spectra, observed the broken tints of Constable and Turner in England, and formulated theories that were instrumental in the later impressionistic experimentation. His drawing is much looser than that of any of his immediate forerunners and his painted figures have a plastic value that at times equalled those of Tintoretto.

**Romanticism** as a movement in French art is closely associated in art histories with technical methods. It has little meaning if restricted to subject matter, for most painters, today and yesterday, have been romantics by temperament. When David painted the *Oath of the Horatii*, the very gestures are romantic, and where the coldness of the conception and the theatricality of the background give one the feeling of rigid intellectualism, the picture's effect on the revolutionaries of the day was to intensify their political hysteria. The painting of classical myths can be conceived only as romantic creations and even the archeological researches of Winckelmann as of Schliemann of a later day are the result of impelling and purposive fantasy. In the 19th cent. romanticism was synonymous with the desire for, and the feeling of freedom from any authoritarian group and it manifested itself as the emotionalism, realism, natural science, experimentation in the realms of fantasy and philosophy and finally the 'back to nature' impulse. Man was freed from Church, priest, noble, king, state and now from God. The artist successively in service to all these 'authorities'; having accepted their dicta as final and having found them a stultification to his spirit, now believed that if truths were to be known he must search them out pragmatically and personally. Empiricism was abandoned, the Industrial Revolution extended trade and the atheistic and democratic mask of science gave him a new and infinitely diversified public, a myriad new arts for his contemplation and use and a legal right to say his thoughts. Needless to say he indulged his preferences. He was exotic, socialistic, communistic, monarchial, democratic, anarchistic, maudlin, fantastic, literary. He was all that man has ever been, only now it could be expressed with impunity and romanticism was the cloak that covered all his dreams.

Man has long contemplated the face of nature and for at least 3500 years has painted it. Lorrain distilled as much mood and Watteau as much shade and light from landscape as did the painters of the Barbizon woods, but with these later nature-lovers landscape was treated realistically. The prearranged trees and hills of Poussin and the backgrounds of the painters of the High Renaissance gave place to the actualities of the French countryside. Diaz (1808-1876), Rousseau (1812-1867) and esp. Corot (1796-1875) are the great men of the group. While Rousseau was more of a formalist and actualist than were Diaz and the Corot of popular knowledge, Corot, in his Italian sojourn produced some of the most solid figure pieces and city-scapes of the entire French development. He was the forerunner in attitude of Monet and the Impressionists and his handling of streets and houses had a profound effect on the style of Cézanne. In his complete career we are witnesses to the 'back to nature', topical actuality, classicism and the 'mood painting' ideals of the day. With Courbet (1819-1877) who proclaimed himself realist, we see that side of

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

romanticism that demands models, present day subject matter, the close attention to realistic lighting and a mind closely akin to that of the sociological Le Nains. He abhorred all mention of classical myths and even picture subjects in the literary sense and with unerring intuition based his effects on the technical approaches, of the Spanish and Dutch. Also sociological and at times more romantic than Courbet, was Honoré Daumier (1808-1875) an artist who began his career as a political cartoonist. By a great economy of means he achieved such solidity of volume that even today the French say he had "Michelangelo in his skin." A succinct and pitiless critic of the foibles, abuses and pretenses of his day, his very ardor of hate transliterated itself into a spark of intense life in his pictures. He opposes strong lights to strong shadows in the manner of Caravaggio and at times like Prud'hon or Millet but his drawing is rapid, nervous, loose and essentializes everything it delineates in a synthesis that may be due to an admiration for Ingres. He is the transition from Goya to Forain.

**Impressionism** was a close study of light and the effects of light in its rôle of presenting visually colored form to the eye. Sanctioned by the realism of the Barbizon painters the Impressionists worked on the theory that whatever is (in Nature's light effects) is right and throwing aside all ulterior motives of classicism, romanticism, literature and subject, they painted nature as they found it. To do so they were necessitated to start afresh with a new palette and a new approach. Turner and Constable had changed the color habits of Delacroix and these three men now were the guiding technical spirits of the new school. Finding that there are no large uniform color planes in nature (Ruskin had noted this fact) they broke their color into small variegated touches and thus achieved the scintillating and ephemeral effects of shifting light. They discovered that sunlight was yellow and that its complementary, shadow, was violet; that local color existed only in half tones and that the complementary of the light portion of the painted object invariably appeared, in some degree, in its shadow. Monet was the great technician of the movement, and Pissarro its high priest. There is not a technical nor formal development in art since their day that is not directly or indirectly affected by their works. In spite of its realism, Impressionism is probably the most romantic of all 19th and 20th cent. painting, for in it there is no room for political theory or practical intellectualization. For sheer nature-beauty and the portrait of every mood-provoking atmosphere of the outdoors, Impressionism can never be surpassed. It adds life and meaning to the colored photograph and naturalism to the Japanese print. It is the culmination of all the artists's researches into optical realism and brings topical pictorialism to a conclusive impasse. The greatest artist of this movement was Auguste Renoir (1841-1919) who in his middle and last period utilized the impressionistic means to the end of form and order.

**Neo-Impressionism**, founded by Georges Seurat (1859-1891) and Paul Signac was a rationalistic summation of the Impressionists quasi-intutive methods. These men strove to make an academic formula, a psychological pragmatism of all the observations that had preceded them and attempted to express these theories by an intellectualized ordination of separated color spots built on the writings of Chevreul, Helmholtz, Rude, Le Blanc and Delacroix. Seurat's art fortunately went beyond his verbal dicta and in his greatest work we find magnificent pattern, drawing based on the synthesis of Ingres, combined with an almost Persian handling of interstice.

It must be borne in mind that impressionism marked the beginning of the use of color in the modern sense and that in destroying the academic barriers of traditional chiaroscuro opened the door to all the uninhibited essays that followed them. Technically speaking, color became the first consideration of Gauguin, van Gogh, Matisse, Cézanne, Bonnard, Vuillard and a host of lesser painters.

Paul Gauguin (1848-1903) called for the abrogation of both the model and of tradition in his followers of the school of Pont Aven and Pouldu in Brittany. He was probably the most radical adherent of the 'back to nature' impetus, even exiling himself to the South Seas to make a stricter contact with the primitive. His work is the first great color decoration of modern times, flatly conceived but savantly varied as to lights and darks. His theories concerned themselves mostly with color and the necessity for its brilliance. He utilized as much contrast as is possible and applied it to a drawing that sometimes is naïve sometimes inept. He never worked over a first impression in his drawing thus saving, as he contended, the spontaneous freshness of vision. A decorator par excellence, he represents the highly romantic element of a romantic period of adventurous individuality.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

Vincent van Gogh (1853-1890), although a Dutchman, is usually considered as belonging to the French progressus. He was a participant in the more or less chaotic élan of the Neo-Impressionists but changed their spots of color into long streaks of color. A victim of paresis and of the reformer's frenzy, his works gained in hysterical intensifications by his malady which eventually ended in suicidal mania. There is perhaps, no example in history of work brought to so febrile a focus, and this, for an age of lightning changes, theatricality, rapid and chaotic evaluations, combined with the tragic story of his life has posthumously made for him a repute that time will probably revise.

While Renoir was inspired by Rubens and the classical Italians in his mature life, Paul Cézanne (1839-1906) was a great admirer of Delacroix. He saw the impasse into which Impressionism was leading and realized the necessity for formal composition, the basis of art, to which Monet and his school paid scant attention. Profiting by the color theories of his day he employed them in the production of ordered three-dimensional objective extensions. To achieve this he disciplined himself to view nature as though he were a chromophotographic plate or a mirror, erasing from his receptivity all the significance of objects as such and viewing his field of observation as a series of contiguous and related colors. By this combination of knowledge and pure objectification he approached closely to Morey's Gothic 'infinitude' and the architectonic stability of the Romanesque church. He belonged to no school as such, but he has created at least three, besides having influenced the work of every serious student of modern art since 1906. His letters became text-books for artists before World War I and his approach to art, both the traditional and revolutionary sides carried incalculable weight in the works of the younger artists of the time. Criticism also, was renovated by his findings and aesthetics became the theme of all writings on art since 1914. Form and order were once more viewed as significant necessities, and technical means supplanted, in these writings, the consideration of literary or psychological theories.

In 19th cent. sculpture we see the same romantic individualism that is present in painting with the same type of left-overs, the classicists and the 18th cent, schools of academic and royal absolutism. Francois Rude (1784-1855) was perhaps the first dramatic sculptor of the 19th cent. and incorporates some traditionally symbolic elements in his romanticism. Puget, Houdon and the Roman arches play a part in Rude's work, but he has added an emotionalism that vitalizes the often academically insensitive forms. The tradition inaugurated by the unconsciously eclectic Rude was carried on by Carpeaux (1827-1875). Barye (1796-1875) was the Courbet and the Michelangelo of animal sculpture, and his works of realistic animal portraiture, every one so characteristic of the fundamental traits of his model, have not been surpassed.

In Rodin we discern a sculptor of varied and noble attainments, at times a poet, a psychologist, but invariably traditional. Jacopo della Quercia, Donatello, Michael Angelo, Ghibertti, Goujon, Girardon, Rude and Carpeaux, have all donated poses and forms to his mercurial talent. He has even gone to the Hellenistic Greeks, and some of his finest figures have been transliterations of these 3d cent. artists. Rodin represents the most facile and expert type of modeling and if his sense of order never equals the works of the greatest of his inspirations from former times, his emotionalism and fervor often outstrip them.

Specialization in science and industry were adumbrated a century earlier in painting. The 20th cent. gives us in its first fifteen years an extension of this tendency in the partitioning of the elements of the work of Cézanne. First we have Henri Matisse (b. 1869) and his Fauve following. Much of Matisse's art is due to the boredom he felt in making copies of classical art for the French Government. He sought and found a more exotic inspiration in Negro sculpture and, according to him, in Persian miniature. As a matter of fact there was much in his second period of both Lorenzetti and the school of Alexandria. Be this as it may, color was Matisse's forte, color used for its brilliant decorative effects and arranged in simple areas. His formal side was never developed and his drawing, when not academic was loosely nonchalant, charming, generally sensitive but never significant in either the classical or realistic sense. His finished works today are like richly illuminated tapestries, extremely harmonious, often rich in chromatic saturation but usually light and ephemeral in their effect upon us. A Persian miniature of the 16th cent. fleetingly seen, a magnificent bouquet of flowers, the faience mosaic work of an Islamic mosque, these superficially resemble the total effect of a number of

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

Matisse's works when viewed together. Gauguin gives us the impression of greater solidity and permanence just as he gave Matisse the sanction for his unnaturalistic translations of objectivity. Matisse in turn widened this sanction for the men of his day and we should recognize his work as that side of the French temperament that numbers such artists as Girandon, Boucher, Cousin and Hébert.

**Cubism** was sired in Paris in 1911 by Pablo Picasso (b. 1877), Braque (b. 1878) and Derain (b. 1876) and was a further sounding of the depths of formal values. Having loved the world, observed the world and enjoyed the world; having developed means to depict absolutely the world, little was left but the world's disintegration into its formal elements. Matisse extracted, as his specialty, the decoratively colored elements of nature and Cubism delved into that part of construction that lies behind the mensurable visual aspect. Picasso, having seen a collection of Negro sculpture in the studio of Matisse, grasped the elementary forms to carry out the suggestion of Cézanne that nature must be reduced to geometrical fundamentals. Color was discarded at first; black, burnt sienna and white giving the thermic and tonal desiderata. Nature in the minds of these artists became wholly subjective and objects as such reduced themselves to partial planes, cubes, spheres and cones. Behind this new experimentation a whole library of pseudo-psychology and pseudo-philosophy sprang up based upon the desire for justification rather than on observation. Its method was verbal logic which often belied the logic of human reaction and like all art movements in which theory plays an official rôle, the art achieved vastly outstripped the literary ultimates. The veritable background for Cubism and succeeding schools was the consciousness of individual freedom, the desire for publicity and a fatigue in the contemplation of hackneyed shapes. The world had grown smaller, universal histories of art had been written by archeological and research aestheticians, the Viennese psycho-analysts had turned public thought to psychology, the Industrial Revolution had regimented mechanically a large part of living, democratic ideals had greatly enhanced man's evaluation of his idiosyncrasies and to cap these climaxes there was a great surge of talent in Paris that recognized the imperative necessity of feral competition. Beyond all this the cyclic return to stable and permanent forms was at hand and the wholly inadequate composition of impressionism had to be corrected again. Cézanne was the bridge that led men from the chaos of modern unrest to the foundations of the great tradition. Over this bridge Cubism passed to assert once more the infinitely subtle mathematics of traditional skeletal structure. This search sums up the first years of Cubism as a student essay to recapture the anatomy of the High Renaissance. Thus, like science, cubism must flay the specimen in its search for the life principle, but that life principle did not reside in qualities, elements or forms, it lay and will always lie in the spirit of the artist who creates better than he thinks.

Two movements toward non-objectivity were the **Orphist** and **Synchromist** schools. Robert Delaunay founded the school of Orphism, later called **Simultaneism**, a lyrical color-expression that at first extended Impressionism into cubistic forms. Instead of acromatic tonalities Delaunay produced a prismatic effect by separately coloring the innumerable geometric planes of enormous pictures. Later in 1912, this prismatic effect largely disappeared while the color, applied in larger planes had greater effect. A year later the planes were interspersed with swirls and eddies of pure color. Synchromism, although founded by two American painters, Morgan Russell (b. 1886) and S. Macdonald-Wright (b 1890) had its inception in 1913 and is included in the French progressus by the official *L'Amour de l'Art*. The theory underlying Synchromism was that color inherently extends itself into an emotional third dimension and that the Impressionists, in recognizing the two extremes of light and shadow (as yellow and violet) neglected to exploit all the intermediate tones as pure color. Russell's work was a translation of these tonal values into pure color while Macdonald-Wright attacked deep space with undiluted pigment.

During this period of intellectual research and art activity three older men had launched the school of the **Intimistes.** Bonnard (b. 1866), Vuillard (b. 1866) and K. X. Roussel were little moved by the more radical tendencies of their time, but had taken advantage of the impressionist concepts which they handled in individual fashion. The color of Vuillard and Bonnard is that of the richest textiles. It has the color that seems to come of the patina of age, besides representing in its most attractive and exquisite style the topical subject matter of the Latin Quarter and the French countryside. Due to louder voices, the Intimistes were for sometime con-

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

sidered as a slightly varied academic tendency, but are now belatedly being acclaimed for their sane and traditional drawing qualities that in the French spirit always include a modicum of stubborn revolt.

**Expressionism**, while not known as a French movement, nevertheless saw its first light in France. Vincent van Gogh well epitomizes the ideals of the Expressionists, which are simply those of direct emotional release devoid of the circumlocutions of any traditional traits. Rouault (b. 1871) is today the great artist of the school. His work is done mostly on prepared and toned paper and depicts dancers, clowns, models and numerous heads of Christ. His reputation is that of a profoundly religious painter, and his work is regarded with a sort of mystic veneration. Having been employed in a stain-glass window factory, where he was immersed in the contemplation of medieval, Byzantine and Gothic holy figures and the technique of their depiction in church windows, he uses black as heavy leading is used in the juncture of the glass segments, with the pure ultramarine, red lakes, purple and yellow of such decorations.

During and since World War I there have been no technical movements launched, whereas before 1914 every advance in French art history was a step in some way directed by new methods or in extending man's visual and emotional horizon by revaluations or new uses of old techniques.

Ozenfant's **Purism** and the German **Dadaists (Hobbyists)**, ineradicably opposed schools, were both ideational as opposed to technical essays. Purism was based on the belief that art is greater than the artist; a sort of archeological architectonic nostalgia that longed for functional art as closely related to its day as classical art was related to classical times. The demand was for **"Constants"**, viz. the depiction of objects of permanent functional value such as the egg and the water-pitcher, intimately part of the life of man and animal for countless generations. Purism was launched in 1918, having been known in its earlier aspect as the **Style Mécanique**, inaugurated by Marcel Duchamp and Francis Picabia in New York at 291 Fifth Avenue with the backing of Alfred Stieglitz in 1915.

Dadaism was a wholly anarchic idea that demanded the total eclipse of all aesthetic, formal or traditional concepts and the destruction of all social or political convention. The only reason for mentioning either Dadaism or the Style Mécanique (whose single famous practitioner is Fernand Léger) is that both had a vague relationship to **Surréalisme.** Wilenski divides Surréalisme into two parts: the first includes that branch which existed before World War I and **Neo-Surréalisme** which he places between the two world wars. The later branch pursued the spirit of wonder and incongruity, of mystery and shocking unrelatedness, of neurosis and the invitation to unreality as expressed by Giorgio de Chirico at its inception. The writers of the manifesto of the post-war movement adopted the name Surréalist, meaning 'beyond the natural', and base their ideals on the Freudian researches into the subconscious. De Chirico had painted Poesque pictures dictated by the lesser neuroses and had juxtaposed articles that ordinarily would appear together only in the dream state. The later men basing their anarchism on that of Dadaism wished to produce by means of a sort of automatism, directed by the subconscious, a complete therapy. To do this they subverted natural shapes and depicted palpable impossibilities. Thus they foresaw the final achievement of man ascendant over his own subliminal self; happier, freer and at last complete. Salvador Dali (b. 1903) is the latest and perhaps the last disciple of Néo-Surréalisme. He is a competent academic draughtsman with little color talent; a painter like Greuze, of anecdotic pictures, and a great showman. His technical means are as minute as Meissonier and his romanticism, unhealthy and tinged with cruelty recalls at times the great Bougereau.

The sculpture of the 20th cent. is as diversified in its personal expression as is its painting. Aristide Maillol comes immediately to mind as the rebel against the baroque and sometimes rococco modeling of the romantic Rodin. Maillol's figures, while superficially inspired by the genuinely classical are, none the less, abstract structures in which volumes are weighed against volumes in the same way in which Cubism balanced its abstractly conceived planes. The fact that Maillol clings closely to synthesized and over-robust human forms often gives one the impression of adipose bodies modeled from the outside. But the very fact that his volumes have this inflated appearance has been a factor in his reputation as a monumentalist.

Constantin Brancusi (b. 1879) reduces objectivity to a strictly personal synthesis always maintaining an elegance of taste, a perfection of craftsmanship and an acute sense of delicate equilibrium. Those artists influenced by his style have made of it a puerile architec-

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

tural adjunct. The Martels in their Debussy monument in Paris are cases in point.

Antoine Bourdelle is a dynamic modeler of reliefs, an illustrator by temperament and a borrower from the antiquity of Greece, Assyria and Egypt. His work has the character of wood-carving and while much of it is well ordered its greatest claim to popular esteem is its violent movement and rugged drawing.

The sculpture of Matisse, Picasso and Renoir precisely follow their individual conceptions of form as seen in their painting. In Matisse, the dislocations and the amorphism of parts; in Picasso, a series of composed, disintegrated masks; in Renoir, the solid and classical conception of synthetic naturalism. See H. Buchthal, *The Miniatures of the Paris Psalter,* 1938; Charles Diehl, *La peinture Byzantine,* 1933; A. Gardner, *Medieval Sculpture in France,* 1931; E. Male, *L'Art religieux du XIII siècle en France,* 1923 and *L'Art religieux de la fin du Moyen-âge en France,* 1925; G. Cheney, *Story of Modern Art,* 1941; F. J. Mather, *Western European Painting of the Renaissance,* 1939. —S.M-W.

**French crepe.** Flat crepe, originally made in France. Now, light weight flat rayon-crepe suitable for lingerie.

**French glass.** See GLASS AND GLASSMAKING.

**French horn.** See MUSICAL INSTRUMENTS.

**French joint.** *Book.* A revived style affecting the hinge of the cover. The boards have a sufficient distance between their back edge and the "round" of the back of the book to allow thick material to be well pressed in and to work freely as a hinge. —H.E.S.

**French porcelain.** See CERAMICS II.

**French ultramarine blue.** An important blue pigment was added to the artist's palette when, in 1814, a compound was produced analogous to the ancient ultramarine derived from lapis lazuli. The artificial pigment is the same in chemical composition but is far more intense in its color and much finer in its particle size. It may have a somewhat more purplish tinge than the natural ultramarine but is equally stable, being unaffected by light or by high temperatures or by alkalis. It is, however, readily decomposed in dilute acid. It is relatively inexpensive and, by 1830, was a regular article of trade. —G.L.S.

**fresco.** The art of painting on a surface of plaster; also, a picture so painted. See mural painting.

**fresco secco.** A traditional mural painting method of ancient origin, specifically the process of painting with fresco pigments ground in a glue or casein solution on a finished, set, lime-plaster wall which has been made wet by saturating it with a limewash (lime water or baryta water). The term has also been applied to several variants of this process and has also been used generally, but not accurately to designate any painting which imitates or approximates the effects of true fresco by painting on a dry wall with pigments ground in an aqueous binding medium such as tempera. In various accounts of the true fresco technique the term *in seco* or *a seco* has been used by writers from the 14th cent. down to recent times to denote the use of such paints as finishing touches to a dried fresco painting. This is not a confusion of terms but merely the use of the Italian word in a more literal sense. Fresco secco paintings approximate the visual effects of true fresco rather well, but lack much of its brilliance, clarity, durability and manipulative qualities. —R.M.

**fret** (Old Fr. *frettes,* grating). An ornament or decoration characterized by angular interlocked or interlacing lines. See meander motif.

**frieze** (It. *fregio,* ornament). (1) Any ornamental band or strip in a wall. (2) The middle division of the classic entablature.

**frieze of buds.** In Greek pottery, a decorative pattern consisting of a row of tall pointed buds of which alternate ones are connected by half circles, at the bottom by one swinging down from the center of the bottom, and at the top by one curving up from each side of the bud below the tip. —L.T.S.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

**fringe.** Exposed cut ends of warp threads of rugs and carpets. The process of knotting prevents the unravelling of the weft threads.

**frit.** *Cer.* Semifused compounds used for glaze base. See CERAMICS I.

**frize** (Fr. *friser,* to curl). Fabric used chiefly for upholstery; the better types are wool, mohair or heavy cotton.

**frontality, law of.** Primitive artists as a general rule represent their figures in such a manner that the parts are presented in their broadest and most familiar aspect. With sculpture in the round the most characteristic and familiar attitude selected by the sculptor has been the directly frontal one. The law of frontality dictates that the postures be such that a vertical plane through the nose and the navel will divide the statue symmetrically, except in the disposition of the arms and legs. In standing figures the left foot is often advanced and in seated figures the arms are not always similarly placed. This formula persisted in archaic Greek sculpture through most of the 6th cent. B.C. Egyptian sculpture was largely religious in character and the natural conservatism: caused these conventions to be retained long after the lack of technical skill imposed them upon the artist. —O.M.S.

**frontispiece.** In its current meaning frontispiece designates an illustration facing the title page of a printed book. However, the frontispiece is older than the title page and is found in illuminated manuscripts previous to printing. In the form of author's portrait it dates back even to the book rolls of ancient Rome. At the beginning of mediaeval manuscripts or of important text divisions one frequently sees portraits of the four evangelists with their symbols, of the Church fathers, or of the founders of monastic orders. The secular element appears with the beginning of the Renaissance. Emperor or king, members of their families or court, other worldly potentates, burgomasters and magistrates are depicted as patrons of the book on its frontispiece. The scholar appears, alone as author, or with colleagues in disputation, or as teacher with students. The *magister cum discipulis* is particularly popular in early woodcut frontispieces. Title pages appeared a generation after the beginning of printing. They were either merged with the frontispiece into elaborately decorated and illustrated title pages, or printed on a separate page. In the 16th cent. the frontispiece retained its position opposite the beginning of the text and on the back of the title page. The 17th cent. saw experiments with elaborate new arrangements, sometimes involving a two-page frontispiece in addition to the title page. The current form emerged in the course of the 18th cent. The woodcut was replaced after the middle of the 16th cent. by copper engraving. Emblematic, symbolical and architectural frontispieces became fashionable, the latter particularly in England. Mezzotint etching, steel engraving, lithography, photography and various color printing methods were successively employed through the 18th, 19th and 20th cents.

In architecture frontispiece designates the decorated front of a building, particularly entrance or portal, and the pediment over a door. See "In search of the Frontispiece", Hellmut Lehmann-Haupt, *The Bulletin of the Garden Club of America,* May, 1940. —H.L-H.

**front matter.** *Book.* The same as preliminary matter. When these were printed apart from the body of the book it was a separate section.

**frottage** (Fr. *frottage,* a rubbing, the act of rubbing). A technique employed by some Surrealists, notably Max Ernst, which results in the transference of the superficial topography of an object or surface — like weathered wood or stone, sacking material, leaves, an unravelled spool of thread — to another surface. A piece of paper, for example, placed on a rough or irregular surface, is rubbed with pencil, paint, etc., and an approximate image of the peaks and valleys results; this image also is called a frottage.

The irregular and unpredictable patterns are sometimes found to be highly stimulating in their suggestiveness, as Leonardo found the markings on old walls to be. (". . . I was surprised by the sudden intensification of my visionary faculties and by the hallucinative quality of the contradictory images superimposing themselves on one another, with the persistence and rapidity of amorous souvenirs . . . the design thus obtained loses more and more the character of the interrogated material, and takes the aspect of second images, capable of unveiling the first reason of the obsession or to produce a symbol of this reason. This new image forms itself passing by a series of suggestions and transmutations which offer themselves spontaneously in the manner of the hypnagogical visions. Therefore the process of frottage rests only on the intensification of the irritability of the mental faculties by special technical means

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

It excludes all conscious mental conduct, reason, taste, morale." M. Ernst). Nevertheless, the producer of the frottage often "assists" the original impression made on the paper.

For further description of the motivations behind frottage, see collage, objects, and the bibliographies given there. —M.S.F.

**fu** (Ch.). A sacrificial bronze vessel. Quadrangular, four low feet; troughlike for holding sacrificial food. The cover nearly identical with dish so that it can be used as a second receptacle. See SYMBOLISM IN FAR EASTERN ART. —J.A.M.

**fuchi** (Jap.). An ornamental metal collar on the Japanese sword at the lower end of the handle, against which the swordguard makes contact.

**fude** (Jap.). Painting and writing brush.

**fugue.** Polyphonic composition, usually in the tonal idiom, based on the principle that a melodic phrase, or motif, (**subject**) presented by one part is imitated in the dominant region of the principal key by the second part (**answer**); if there are more than two parts they alternate in presenting subject and answer by their consecutive entrances. A fugue usually has several sections of the structure indicated above, called **expositions** which are connected by **episodes**, or **interludes**, developed from motivic material related to the subject. **Stretto** is an exposition in which imitations of the subject occur in time intervals shorter than the subject. **Double, triple** (etc.) **fugue.** Fugue with two, three, or more subjects which may appear simultaneously by virtue of their being written in double, triple (etc.) counterpoint. —E.K.

**Fujiwara art.** See JAPANESE ART.

**fukusa** (Jap.). A nearly square, double piece of heavy silk on which the tea-bowl is ceremoniously passed during *cha-no-yu* (q.v.). See TAPESTRY.

**full anthem.** See anthem.

**full-bound.** *Book.* Generally used for leather bindings when the term denotes that the book is entirely covered with leather in one piece; more often used "full leather" or "full cloth," etc.

**functional.** See utilitarian.

**functional architecture.** This type of architecture is characterized by the tendency of expressing and showing through the shape of a building its function, its construction and its material as clearly as possible. That refers not only to the layout, to the façade, and to each individual part of a building, but also to the specific character of the used materials and techniques of construction. Although this tendency is esp. stressed in modern architecture, it is as a whole not an entirely new phenomenon.

Roman architecture with its aqueducts, theatres and public baths, medieval architecture with its fortresses and castles, the bridges of the Renaissance, and even the layout of classicistic Protestant churches, to mention only a few examples, prove that the idea of functionalism in architecture recurred again and again.

Actually each revival of ancient forms, from the early Renaissance to the classicism of the end of the 18th cent. did refer not only to the alleged "eternal beauty" of antique forms, but to their intrinsic "truth", too. The pioneers of the respective revivals always emphasized that the ancient forms expressed most clearly the struggle between weight and support, showed the most simple forms of elevation, and were in any way the most natural. Even if our conception of Greek architecture does not agree with these statements, the mere fact of mentioning these reasons as positive advantages proves that the inner tendencies of these periods approved functionalism in architecture.

Modern functionalism represented first a revolt against the use and the misuse of the borrowed forms of earlier periods by the eclectic architecture of the 19th cent. The paradox of a modern theatre in the form of ancient Greek temples, of railway stations which looked like Roman baths, etc., was felt and conquered. The real practical purpose of a building should become visible. Real architectural beauty could not originate if this first supposition of building was not fufilled. Equally stucco should not appear as marble, sheet metal as bric-shingle, etc. A modern construction in steel should not be dressed as if built in stone, the materials themselves should become visible as such.

Thus the elements of building, material, construction, organization of the layout became more and more essential. As a reaction against the make-believe imitation and the borrowed splendor of earlier styles, those above mentioned factors were recognized as

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

the essence of building. By emphasizing *only* these newly rediscovered factors, however, the architect voluntarily renounced—at least theoretically—the creative power of his spatial imagination. The engineering part, everything that could be calculated and computed, took the lead over the intrinsic imaginative shaping power.

Thus it was only natural that industrial architecture was the first realm in which the best works of new architecture were created.

In the U.S.A. the first pioneers were the members of the so-called **Chicago school** who based their buildings upon steel skeleton constructions, excelling among them Louis Sullivan (1856-1924). In some respects Frank Lloyd Wright (b. 1869) worked in the same way. In France it was Tony Garnier (b. 1869) and Auguste G. Perret (b. 1874); in the Netherlands, H. P. Berlage (1856-1934); in Germany, Peter Behrens (b. 1868); in Austria, Josef Hoffman (b. 1870) and Adolf Loos (1870-1933); in Finland, Eliel Saarinen (b. 1873). The whole movement gained impetus after the World War I. In Europe the leading architects of the new generation were in France: Le Corbusier (b. 1887), André Lurcat (b. 1894), Robert Mallet Stevens (b. 1886); in the Netherlands, J. J. P. Oud (b. 1890), Van der Vlugt (b. 1882), Wilhelm M. Dudok (b. 1884); in Germany, Walter Gropius (b. 1883) and his **Bauhaus Kreis**, Mies van der Rohe (b. 1886); in Scandinavia, Alvar Aalto (b. 1898). In England, an independent modern movement did not develop.

In the U.S.A., Frank Lloyd Wright continued working; besides him Albert Kahn 1869-1943), G. Howe, and William Lescaze (b. 1896), Richard J. Neutra (b. 1892), Raymond M. Hood (1881-1934) and many others. Fortunately these artists who theoretically relied entirely on the expression of function and material, were, nevertheless, creative artists in the original meaning of the word in so far as they went far beyond mere engineering construction.

Since the 1930's, the U.S.A. developed a new style which although entirely functional was saved from the exaggerated dogmatism and coolness which characterized creations of the pioneering period in the various countries abroad.

Although the time of overemphasis of mere functionalism is over, we have to be grateful to this period for clearing the field by abolishing entirely the imitative historical eclecticism of the 19th cent. See international architecture; streamlined; also Geoffrey Scott, *The Architecture of Humanism,* 1924; Lewis Mumford, *Sticks and Stones,* 1924 and *The Culture of Cities,* 1938; Le Corbusier, *Towards a New Architecture,* 1927, *The City of To-Morrow,* 1929 and *La Ville Radieuse,* 1934; G. **functionalism.** See POST-REVOLUTIONARY ARCHITECTURE AND DECORATIVE ARTS IN THE U.S.A.

**fundame** (Jap.). A lacquer technique. Powdered gold or silver laid on lacquer and polished flush with the lacquer surface; dull finish.

**fundamental.** See ACOUSTICS; scales and modes.

**fungus.** Used as a motive in oriental art to symbolize longevity; in China called *ling-chih,* in Japan *kinoko.*

**furiant.** A rapid Bohemian dance of changing accents and rhythms.

**FURNITURE.** In its limited definition in America, means movable objects of utility, corresponding to the French *meubles* or the German *Möbel.*

Design in furniture is an ever-changing effort to reconcile utilitarian demands with current decorative expressions, technical skills and processes, shifting interest in new or revived materials, economic, social and political moves. The hybridization of basic types as

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

well as the variation of decorative themes stems from this process of reconciling the background and the wishes of the user.

The critical elements of furniture design are function, material and technique.

*Function* divides categories of furniture by their uses. Furniture as we know it is conceived fundamentally for residential use, and may be divided into forms for (a) *rest or repose*—chairs, benches, stools, settees, sofas, couches, chaise lounges, beds, daybeds, divans, etc.; (b) *work forms*—tables, desks, stands; (c) *storage forms*—chests, cupboards, cabinets, armoires, bureaux, bookcases, wardrobes, boxes, etc.; (d) *decorative forms*—frames (for mirrors and pictures), brackets, consoles.

*Materials* comprise woods, metals, stone, textiles, glass, compositions or synthetics, ivory and other precious accessory materials.

*Technique* of furniture harmonizes the skill of designing and the skill of manufacturing. Manufacturing utilizes knowledge of materials, methods, tools and machines. Designing adds to this knowledge an understanding of the emotional factor of furniture, of its capacity to satisfy a human craving, an expression of the quest for something transcending sheer utility. Variably, the artist as designer stresses one factor or another according to his taste, and his client's. His repertoire includes: (a) outline or silhouette, largely dictated by consideration of function, ultimate background, materials available; (b) surface treatment. The latter offers choice of wood or material selected for color, texture, use; and decoration or ornamentation. In this there is a vast library of historical themes and methods of using them. Painting, staining, polychromy; relief, scratch and chip carving; veneering, inlaying, appliques, metal mounts, mouldings, are all means to the expression of decorative motives. Nature supplies animal and plant themes; mythology has amplified these into gargoyles, chimerae, imaginative creations; conventionalization has subdued the realistic forms and geometry has supplied a catalog of its own.

The use of historical or traditional ideas is more persistent in furniture design than in any other of the arts, and the present generation has seen this carried to its farthest extreme. In all the history of furniture no electicism has made such a virtue of itself, nor so enthusiastically resorted to more slavish copying, as it has in the U.S.A., in the first third of the 20th cent. It may well be that the very ease and abundance of life, the height of technical skills, the universality of some knowledge have encouraged this dilettantism, instead of fostering true design as it should be inspired by use, material, technique. This element of capriciousness has appeared before, always in eras of soft living; it may be the debutante stage in the nation's artistic lifetime.

For all practical purposes there is little value in examining the history of furniture preceding the modern world. This does not deny the artistic achievements of earlier civilizations, but it does isolate those achievements from the social-economic aspects of relatively modern times which produced new needs and new solutions in furniture. Egypt had furniture, and so did Greece and Rome, and medieval Europe blossomed in superb woodwork. But we must look to the Renaissance for the beginnings of recognizable forms, because it was in this era that life took on those outward forms, socially, politically, economically, that still form the framework of everyday life.

Egyptian remains testify to an original, highly developed furniture art, both secular and religious. The latter was highly ornate and richly wrought as befits objects dedicated to the gods, but domestic articles were of simple functional design. The evidence of actual remains as well as that pictured in documents — papyrii, wall paintings, burial models, etc.,—reveals a beautifully direct approach to design, with subordinated ornamental features of great beauty. Wood was not common, so it was used with discretion and taste, carved naturalistically in the manner of Egyptian sculpture, and supplemented with veneers and inlays of precious metals, faience, ivory, mother of pearl and painting in conventional and pictorial designs. Animal forms appear as legs and arms of chairs, tables, couches:—lions' paws for feet, duck bills, serpentine heads, etc., for arm rests. Folding chairs and beds were common. Boxes and cases for storage, for dressing and writing materials, sarcophagi of many types and degrees of splendor are among the exhumed tomb relics.

Other Near Eastern furniture arts—Assyrian, Persian, Phoenician, Judean, etc.—appear to have been derived largely from the Egyptian, lacking the vigor and originality of the latter. Our knowledge is conjectural, based on bas-relief decorations.

Greek sources indicate a lively development and understanding of furniture, although our judgment is derived from vase paintings and bas-reliefs, rather than from actual remains. Abstract forms of graceful lines are indicated;

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

the catalog comprises chairs, beds, and couches, tables and chests. Mediterranean woods—olive, cedar, oak and cypress were enhanced with bronze, gold and silver. Rich fabrics were used for cushions in profusion.

Rome borrowed and adapted freely, and produced finally the Greco-Roman style of which examples are found in the buried cities. The range of materials and decorative details was enlarged from Greek and Egyptian sources, and developed types of chests, armoires, tables, benches, stools, and chairs appeared.

The Middle Ages, until the triumph of the northern Gothic, left few relics of furniture art. Byzantine and Romanesque remains are few, and scarcely indicative of any substantial crafts. Barbaric and debased, they were ecclesiastical in function, ornately architectural in form and ornamentation.

The great centuries of the continental Gothic —13th, 14th, 15th—left a complete furniture art, vigorously original and almost exclusively ecclesiastical. Both its structural system and ornamental vocabulary are completely architectural, scaled-down representations of building forms and details. Since the function of this furniture was an integral detail of the function of the building, this technique of design is admirable and thoroughly sound. It produces a harmony of parts, a consecutiveness possible only in such single-minded compositions. There is, furthermore, no considerable difference between secular and religious types, since the church idiom was dominant in every artistic expression; the social organization demanded little else. The mass of the people had nothing. Nobles and clergy lived a semi-nomadic existence in fortress-like castles, requiring little furniture. Important throne-like seatings show origins in the developed panelling of the room as well as in the stately throne of Romanesque form. Lesser seatings were of folding types. The least were mere planks on legs.

**Storage forms** began to evolve in earnest in this era, growing out of the portable chest that could be packed upon a mule, up to the stately **hutch** form, the chest on trestles. The **credence, hutch, settee, dressoir,** are all offsprings of the **coffer.** In ornamentation it advanced rapidly from the Romanesque iron bound box to an architectural scale model, featuring arches and tracery of exquisite intricacy, as well as the more abstract linenfold drapery on one hand, or fairly naturalistic relief pictures on the other. However, the real significance of the developed chest form lies in the progress from the structure of rude box construction, mere joined planks, to the ultimate **panel-in-a-frame construction.** This appeared about 1300 and reflects the structural wisdom of the strong skeleton with the light **filler panel,** the system which is the secret and the innovation of Gothic construction.

Tables appeared late in the period. Earlier the table was a mere board on trestles, and this form crystallized as the permanent **trestle table,** or **refectory,** with infinite variations. Beds, in the transportable form, were mere rough frameworks upon which were draped the bedding—the canopy, the curtains, etc., which formed the medieval bed. With permanent abodes came decorative woodwork, but the bed as a monumental composition of textiles only began to decline in the late 17th cent.

The materials of Gothic furniture were invariably local, but predominantly oak. Walnut, beech, and pine appear in sections where these woods abound, as in southern France and the Alpine regions respectively. As significant as the development of joinery technique is the superb carving style which grew straight out of the tactile nature of the wood at hand, and the motives of familiar things. Seen through deeply religious eyes, all the common natural forms,—plants, animals, symbols—are the themes of conventionalized and naturalistic representation in carving and painting. Wood, stone, metal, textile, ivory, or whatever the medium, it is almost uniformly handled directly in good scale and with commendable regard for texture. In all media we find the themes of leaves, vines, flowers; grotesque human and animal representation; complex geometric outlines like cusped arches, trefoil and quatrefoil; the dramatic shadows of full moldings and strong ogee curves.

Strictly speaking, there was no decline of the Gothic style. It reached its zenith in a flamboyant flush, at the very height of which it found itself adding new, alien, irrelevant details. These, the product of an almost contradictory line of thought, were the first surges of the Renaissance, pushing north from Italy.

The growth and spread and subsequent phenomena of Renaissance furniture are analogous, diagramatically to the effects of a stone cast into a quiet pool. Concentric, expanding rings strike an irregular shore, at each point forming a different pattern, the whole effect similar. The Renaissance emanated from Italy, never truly Gothic. It spread geographically to those lands closest to Italian thought:

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

France of the Medici, Spain, the Spanish Netherlands, Tudor England. In each of the coalescing nationalities grew a social organization consistent with its political rise, and in each a distinguishable idiom of furniture design. The varying impact of similar forces upon more or less impressionable material, the time lag, the revaluation and the individuality of interpretations gave rise to styles. The styles of the last four centuries are today the repertoire of furniture design.

In Italy the Gothic was sheer affectation; Italian Gothic was a medley of Byzantine polychromy, the half-remembered classicism of the Romanesque, and a smattering of irrelevantly applied northern details. With the 14th cent. a conscious revival of interest in ancient learning brought a reawakening to Roman art and architecture; before long these themes began to appear in furniture designs. More, the revival produced a change in living habits which engendered new furniture forms.

The **chair**, a ceremonial object of remarkable uncomfortableness, struck root in every known form and became an object of common use. By 1600 the **framework chair** had descended from a stiff, high structure to a shape we recognize today; the wood seat became leather bands or had applied cushions, which presently appeared as the upholstered seat. The ponderous **folding chairs**, lightened and decorated, are identified as **Dante** and **Savonarola** chairs. Up from the rude three-legged stool came the **sgabelle**, ancestor of all light side chair forms.

The ubiquitous chest, a utilitarian necessity most often built for storage and readiness for transport, grew in size and splendor. Become overlarge for travel, it took new forms. Set up on high legs, the lid became hard to handle, so drawers appeared in the lower part, and the **chest of drawers** is born. Other solutions produced doors in the lower part, giving rise to the hutch and credenza types, and the concept of the high cabinet on legs.

On the other hand, the chest which is in its nomadic stage provided seating surface, and consequently a surface upon which a retainer might sleep, took on the aspect of the familiar bench when it appeared with high arms, later with a back, finally with cushions; hence the whole category of **long bench (cassapanca)**, **settles**, settees, **sofas**. Still another branch was the desk group, the great Italian **fall-front desk** with its many compartments and drawers, parent of the Spanish **Vargueno**, the **bureaux**, the **escritoire** or **secretary**.

Bed types in Mediterranean countries have changed little since ancient times; the elevated platform on decorative legs, and the headboard for reclining are the only essentials, and only the superficial details and the padding have changed. This is contrary to a tremendous metamorphosis in the bed type which took place in northern countries.

The table form was projected into astonishing variations. Basically two forms, the oblong top on trestles or legs, and the round or equilateral shape on a central pedestal. The types were merged, crossed and combined into most of the shapes known today. Most distinctive is the highly carved slab base bearing a long narrow top, the so-called **refectory** shape, an echo of ancient Rome.

Italian furniture of the 15th and 16th cents. exhibits some general characteristics irrespective of locale. The *quattrocento* is everywhere a style of great purity and restraint. Scale is noble, but quite human. Ornament, sparingly used, is classical in theme, mostly carved; mythological symbols, foliage and scrolls in the ancient manner, architectural details like egg-and-dart, dentils and other molding enrichments. The wood is preeminently the local walnut. In the *cinquecento* the scale became bolder, the ornament less restrained. Bolder carving was supplemented by polychromy, decorative and representational painting, gesso, intarsia, gilding, metal mountings. The classic motifs were expanded, the whole vocabulary enlarged, and added were courtouches, strapwork, broken pediments and capricious recasting of every accepted classic detail.

Between the cinquecento and the climax of the baroque occurred devastating political changes which caused a backwash in Italian design. Formerly exclusively a product for export, furniture ideas from other lands came to Italy during the 17th cent. Marked in Italy as the **decandenza**, this period must be viewed from the perspective of other countries. Least dissimilar in Spain, a rising Italianized French court imported and exported ideas, while far off England put its own stamp on its imports, and created fresh decorative forms.

Furniture of medieval Spain shows first the conflict between Moor and Christian. Mohammedan elements persisted in the fine geometric detail and brilliant light and shade. Even Spanish Gothic uses dramatic blank areas as a foil for brilliant detail. This style, the **Mudéjar**, succumbed to Early Renaissance influence from Italy. The adapted style is the brilliant **plateresque**, its apex coincidental with

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

the climax of Spanish world power, and so reflected in Spanish Colonial art around the globe. With relatively few essential improvements over the Italian, the rendition is highly individual, the craftsmanship inferior. Rich painting, extravagantly scaled detail, extensive use of metal mountings, repetitious turned elements, wide employment of leather are recognizable details. The **Vargueno**, high desk on stand, is the outstanding achievement.

The plateresque was followed by a brief period of reaction, a harsh, ascetic style sometimes called **desornamentado**, sometimes **herrera** after its designer, architect to Philip II. Inevitably arose the colorful **churrigueresque** style, a vivid imaginative outburst of Baroque splendor, not too distinguishable from the more violent Italian prototypes, strongly mixed with irrelevant borrowings from everywhere. Spanish furniture never again rose to the vigor of a complete individual style.

The Renaissance era in France is most significant. At first the Gothic forms were merely modified with Italian detail. Francois I brought the chateau form up to the great monuments of Blois and Chambord, and for the furnishings of the interiors he imported Italian workmen, their habits, ideas, materials. French furniture of the 16th cent. is magnificent, ornate, heavy. Great cabinets are elaborately carved with complex motives; there were inlays of stone, metal, rare woods. Tables and chairs acquired new importance. Beds were voluminous masses of drapery. Oak is extensively supplemented by walnut.

In the Netherlands influence was Spanish through the 16th cent. Cabinets, tables and chairs showed the same development as in France, but its opulence was in the more sober Spanish vein. A typically restrained, full richness persists in the Lowlands for several centuries, regardless of style, and features like spiral or twist turnings, arcaded galleries and chair backs, deep flutings and a sturdy constructional sense are known as **Flemish**, whether they occur in English or Continental work.

Germany as a whole showed a decided time lag in the acceptance of the Renaissance. In the south a clear Flemish-French infiltration took place, although the general mass and texture remained Gothic. The trading ports in the north likewise accepted decorative themes, but retained simplicity of outline, a low rectangular quality, and, in the carving, much lower relief in the Scandinavian tradition.

England of Henry VIII and Elizabeth gives the most complete picture of 16th cent. furniture evolution from the medieval. **Tudor** oak furniture retains its essentially Gothic style, probably the best developed truly Gothic furniture; but it begins to acknowledge Italian, French, Flemish influence in ornamental detail and in the enlarged catalog of shapes and uses. Structurally the designs are not subtle. Tables and chairs are extensively underbraced; members are unnecessarily heavy, the joinery elementary. Great bulbous or melon turnings dramatically exaggerate the legs of tables and bedposts. The latter were great structures often independent of the beds. Rather crude members were elaborated with spirited carvings, inspired by but certainly not in the Italian manner. In common with all 16th cent. furniture, Tudor-Elizabethan work evidences the enrichment of everyday life.

This development in England continued evenly under the Stuarts through the first half of the 17th cent. Better known as the **Jacobean** (q.v.) period, the reigns of James I and Charles I saw the evolution of a rich woodwork style, increasing comfort, the steady progress away from Gothic ideas, a free use of Flemish, Italian, French details, with no sacrifice of the distinctly English quality. The Puritan Revolution swept away the ornate grandeur, yet Cromwellian furniture is a simplified, lightened, severe variation of Jacobean forms and proportions. Knobbed or sausage turnings and scant carving were the only decorations on the low, rectangular shapes.

In France, Louis XIII continued the political development of the French nation, and permitted steady growth of its substantial furniture art. Two significant branchings should be noted in this period. First, the rise of the bourgeoisie, who, taking over the furniture mannerism of the period retained and developed its characteristics into a collateral set of styles referred to as **Provincial French**; second, the infiltration of the baroque from Italy, and its flowering into the grandiose **style of Louis XIV**. In a sense, the latter is the result of the former, for the Sun King could not permit his grandeur to be imitated by inferior classes, and was so constrained to evoke a new kingly style.

The 17th cent. everywhere expanded the modern spirit. Renaissance art attained its height in Italy, and exploded in the movement known as the **baroque**, which replaced classic restraint and poise with a quality of surprise, of drama. In the beginning baroque furniture merely amplified stately regularity giving way to freedom of outline and movement. The style of Louis XIV epitomizes this amplifica-

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

tion, for here furniture attains its greatest splendor in monumental scale, formality, lavish ornamentation. The royal concern with **meubles de luxe** is seen in the state control of the Gobelins factory, which manufactured not only tapestries, but furniture of precious foreign woods, often overlaid with gold and silver, or inlaid with brass and bronze, ivory, tortoiseshell. The name of André Charles Boulle is associated with this excessively complex surface design, but no single name applies to the superbly chased bronze mounts which protected these fine surfaces, and which themselves became the chief ornamental medium during the succeeding century.

The baroque of Louis XIV is restrained and formal in outline, massive in scale; these qualities were the chief features borrowed by the English after the **Restoration.** The splendor of Charles II is an echo of France, translated into English. Veneering is a prime development, and there is a clear association between Boulle's work and the intricate pattern of Restoration inlaying. Scrolled legs and robust curves betray the baroque, whether in cabinets, chairs, or tables. Beds were prodigious compositions of textiles. Mirrors became common. The chair and its allied forms developed along lines which still persist. Walnut was the preeminent wood; joining technique is more knowing and more daring.

Chinese influence appears as an affected mannerism during the 17th cent. and in repeated waves enters subsequent styles everywhere as a phase. Chinoiserie appears in Louis XIV work as decorated panels, in textile motives, in simulated lacquer effects. Dutch traders brought screens, boxes, textiles, small objects; and even carried cabinets to China to be decorated. England had periodic crazes for Eastern motives, and "Japanning" — a process of imitating oriental lacquer—covers much late 17th and 18th cent. work (see chinoiserie; Japonism).

The turn from the 17th to the 18th cents. in England is marked by the accession of Dutch influence in the eras of William and Mary and Queen Anne. The grandiose swagger of the French style of Charles II gave way to a smaller, intimate scale, lightness and comfort, at no loss of elegance. Walnut was chiefly used; veneering was less complicated. The **cabriole** leg developed into its best form, and appears without stretchers, as a distinguishing feature. There is an ever growing list of furniture articles, and its general character becomes similar to the furniture in use for the next two centuries. A distinct Englishness appears, and remains.

A most significant transition took place in France in the first quarter of the 18th cent. The periods of the **Regence** and **Louis XV** are marked by the change from the rectangular to the curved line, the thinning-out of the stately baroque of **Louis XIV** into the feminine prettiness of the **rococo.** Symmetry and straight lines give way to unsymmetrical compositions curved in every plane. Capricious, fantastic ornament was based on natural forms—flowers, rocks and shells, animals, ribbons and scrolls. Probably the most decorative forms ever produced, Rococo furniture is smaller, more elegant, than **Louis Quatorze;** it employs all materials known before—precious woods, marquetry, marble and faience, bronze and gold, lacquering in the ornamental manner, and pictorial painting—in free designs, forsaking all balance and forcing the structural lines into curves. Chinoiserie cropped out incessantly. There were new types: writing tables, chaise longues etc., all contributing to the polite life and the feminine elegance of the time.

The **rococo** swept over all Europe, and persists in details without interruption up to the present day. Its local variations are most interesting. The great cities of Italy, now in decline, seized upon the style and exaggerated, cheapened it into highly theatrical excesses. In southern Germany the rococo completely ran away with taste, and a wedding-cake architecture was supplemented by an effusion of ornamental extravagance. It spread north and east; to north Germany and the Scandinavian countries, to Poland and Russia and Austria, everywhere being handled with as much or as little artistic discretion as local taste dictated.

The rococo did not overwhelm England. The years of the first Georges produced a rich furniture style, fostered by the spread of wealth and good living. While the period is often referred to as **Georgian** (q.v.), the term is chronological only. The Georges did not influence design as did the Louis, or as had earlier British monarchs. Instead the source of design is found in those effective individuals whose names stand for 18th cent. English furniture. Kent, Chambers, Vanbrugh, the Halfpennys, Manwaring, lead up to **Chippendale** (q.v.), in whom culminates a combination of eclecticism, craftsmanship and salesmanship. Chippendale borrowed freely, using a baroque basis for his essays in the French, rococo, Gothic and Chinese "taste" or whims of his clientele. He produced superb

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

furniture in his own excellent shops, often working in collaboration with other designers, and acquired a most catholic range of taste which he embodied in his important publications. These books served as guides to cabinetmakers in England and her colonies, and so the whole manner of the middle 18th cent. is labelled Chippendale.

A revival of classicism features the fourth quarter of the 18th cent. Even before Louis XVI ascended the French throne in 1774 the sweetness of the rococo had begun to cloy and the reaction was violent and complete. The straight line returned, chaste, austere, refined, imitating classical antiquity. Scholarly archeology tinctures the whole thought of the period. In France it was the intellectual scenery of the Revolution, but it first contributed to the sophisticated, luxurious style known as **Louis Seize**. Graceful, delicate scale, classically conventional ornament, simple surfaces of paint or fine woods elegantly treated, are elements of this style. It was accepted gradually throughout Europe, appearing in local versions of remarkable individuality.

Classicism represented no such revolt in England as it had in France, because many British designers had never honored any other influence. Notably the Brothers **Adam** (see Adam style), architects who designed every detail for their buildings, were the masters of the "Antique"; their symmetry, square lines and classic ornamental details drove out the claw-and-ball baroque, the pseudo-Gothic and the limited rococo sponsored by Chippendale. **Hepplewhite** on the other hand took more license, and only later abandoned these influences, and then devoted himself to a more congenial classic touch. **Sheraton's** work is closely parallel to the Louis Seize at first, but later sacrifices to a confusion of semi-classic themes. Nevertheless Hepplewhite, Sheraton, Shearer and their contemporaries produced a body of furniture design unsurpassed in grace, simplicity, and technical excellence. Sheraton excelled particularly in designs embodying the extremes of mechanical ingenuity and of light, dignified elegance. The style favors tapered or simple turned legs, restrained ornament of classic nature, emphasis on the wood quality, which was prevailingly mahogany. Toward the end of the century satinwood and other exotic materials came into favor.

The French Revolution at first produced a modification of the Louis Seize style known as the **Directoire**, a simplified reflection of the grand manner. Napoleon superimposed his **Empire** style practically by edict. This is a conglomeration of themes from all antiquity —Egyptian, Greek and Roman,—heavily rendered. Its strained classicism dominated all Europe and produced collateral styles of dignity and directness. The **Biedermeier** (q.v.) in Austria and Germany and the Neo-classic of northern Italy rendered the restrained outlines in native woods, and even translated the imperial motives into the local fruits and vegetables. England was too rich to do the thing simply. The precious eclecticism of Thomas Hope inspired much of the style of the Regency and of Victoria's early years, and the descent of taste that marked the 19th cent. was well under way.

Furniture in America, like all colonial interpretations, adapted the patterns of the mother country to native materials, skills, specialized wants, plus the usual time lag. The settlers were rarely of noble origin, so their production can be assumed to follow the lines of provincial work, the aristocratic manner simplified or even misunderstood, and a generation late. Thus the New England colonists brought elements of mediaevalism which for two generations colored the architectural background. Dutch, German, Swedish, French and Spanish groups, developing their traditions on alien soils, produced designs of earnest purposeful quality, in their native idiom. In the 18th cent. life grew easier and aimed at deliberate style, leading to importation of ideas as well as materials. Thus the **Philadelphia Chippendale style** rendered by Savery and Gostelowe, its derivative in the work of Goddard and the Rhode Island school, and finally the **Sheraton-Directoire** inspired work of **Duncan Phyfe** (q.v.). Great masters these, but interpreters first. The **Colonial** (1600-1775) and **Federal styles** (1775-1840), the **Neo-Classic (American Empire,** (1810-1850), the **Neo-Gothic** and various other Neos were truly individual so far as material and execution went, but they always reflected the European scene.

The middle 19th cent. saw the furniture aesthetic bogged down everywhere. The machine confused everybody, chiefly the furniture maker who saw in it only a means to fake the virtuosity of hand craftsmanship. In the '70s arose a sporadic discussion of the state of design, which brought positive gestures from Eastlake, Pugin, William Morris and others, but unfortunately their efforts were toward the neutralization of the machine rather than toward manipulation. The Art Nouveau movement and its branchings of

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

Arts-and-Crafts, Jugendstil, Mission (q.q.v.), etc., failed to arouse any continuous interest, and for the greater part yielded to pure copying and the glorification of stylism and the antiques industry.

The so-called **Modern** movement caught the public eye about 1925. It had no single clear idea, and proclaimed a functionalism it did not practice, even in some of its most austere phases. At this stage it appears to have sounder motive force, through the exigencies of war, than it has had previously. Expediency and the discipline of strict necessity will probably stimulate sounder creative thinking than did the sheer intellectualism and artistic snobbery that preceded the war. Certainly the talk about "machine processes" is materializing, for we are now confronted with the beginnings of a wood technology which cannot but stimulate designing of a new order.

Woodworking machines have hitherto been chiefly tools, directed at one or another of the traditional processes of furniture making. The cutting of the log into boards, the seasoning and drying, the various steps of cutting, planing, turning, shaping, smoothing have all been handled mechanically, but *each as a separate process.* Finally the assembling, the joinery, is a hand operation, its quality entirely a product of painstaking craftsmanship. The wastefulness of each part is just about the same as it was in Egypt four thousand years ago.

The new approach springs from the changing nature of wood, wood as a *reconstructed natural material* rather than a raw material. If the nature and properties of wood can be changed, as now appears likely through the developments of new adhesives, new molding processes, and the plasticizing of wood, furniture will automatically be designed in a new idiom. This will not be the precious design of aesthetes, weighing the advantages of stylism; it will be laboratory, shop design, the design of the technologist, of the production line, for better or worse. And if it will be cheap, strong, truly functional, conserving of material and labor, no power of critical taste will be able to stop it. Only then will the Industrial Revolution have reached furniture. **furo** (Jap.) A portable charcoal brazier on which the water is heated for *cha-no-yu* (q.v.).

**fusa.** See NOTATION

**fused art program.** See art program, integrated (2).

**fusma** (Jap.). An opaque, movable room-partition upon which Japanese artists lavish their best pictorial efforts.

**fusuma-e** (Jap.). The painting applied to *fusuma* (q.v.), movable room partitions in Japanese homes and temples.

**futa-oki** (Jap.). A small pottery cylinder, a pedestal, on which the cover of the hot water kettle or the hot water dipper may be rested during *cha-no-yu* (q.v.). —J.A.M.

**futsujin** (Jap). Fly whisk made of white hair fixed to a short handle, "to clear away the dust of this world."

**futurism.** An Italian doctrine in painting, sculpture, and literature, which flourished from 1911 to 1915, and which endeavored to portray the essence of movement without the thing that moves. The first manifesto of futurism was published by the leading critical and literary exponent of the movement, Marinetti, in 1909, but the first examples of painting and sculpture appeared in 1911. Carra, Russolo, Severini, Balla, and Boccioni were the leading futurist artists, the last being a sculptor as well as painter. Marinetti was the leading futurist writer, and was proportionately the most successful futurist, since the objectives of the movement were best adapted to literary expression.

In content, futurism stressed the dynamism and violence of our age and opposed a culture which looks to the past and smothers new art

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

forms. It glorified the "dangerous life", war, blind patriotism, and the age of machinery. Politically it was fascist; ethically Nietzschean; philosophically Bergsonian.

In form, futurist painting was based on neo-impressionistic bright color, and cubist design. It endeavored to destroy the materiality of objects and to depict kinetic and dynamic effects by the principle of simultaneity (q.v.) borrowed from cubism. Painters endeavored to fuse objects with their surroundings to express the speed and character of movement, and at the same time they desired to retain decorative two-dimensional pattern. In sculpture Boccioni tried to do away with circumscribed natural form, to prolong the forms into space, to open them up, and to reveal the dynamics of their movement.

In spite of its short life futurism had some influence on the art of other countries, on French Cubists and Purists, English Vorticists 1913-14, Russian Constructivists 1913-22, and Franco-German Dadaists 1916-22.—L.D.L.

**fylfot.** The swastika.

**gable.** (1) The upper part of an end wall, above the level of the eaves, beneath the end of a ridge-roof that is not hipped or returned on itself; commonly triangular. (2) The entire end wall of a building. (2) Any gable-like member. —J.M.M.

**gable roof.** *Arch.* A ridge-roof terminating in a gable.

**Gabrielino.** See California Indian art.

**Gabri ware.** See ISLAMIC ART; PERSIAN ART.

**gadroon.** Notching or carving in a rounded molding; a fluting or reeding, often nearly oval, used in silverware, etc.

**gaku** (Jap.). A panel-painting. Mounted and enclosed in a wooden frame.

**gakumen** (Jap.). A framed picture.

**gallant style.** represents an attempt on the part of musicians to write music which should be pleasing, graceful, and easily comprehensible. It is the music of an ornamental aristocracy which, though it still demanded music of pomp and ceremony for official occasions, had learned to employ music in less serious hours as a language of compliment and of courtly discourse, pleasing without excess of passion, devoid of difficulties for the ear. It represents a stage of transition between the baroque music of Bach and Handel and the fully developed classic style of Haydn and Mozart, but looks forward to the elegance of the classic style rather than back to the grandeur and the musical science of Bach and Handel.

We may trace this general trend in polyphonic music in the work of composers who, against the opposition of such conservatives as Fux, wrote fugues in a lighter polyhonic style with much freedom in the treatment of dissonances and with such emphasis on the most important voice that the rest are reduced to accessory designs. The opposition of Fux though bitter (he wished to suppress the new "licentious" style by imperial edict) was in vain. Marpurg admits in his treatise on fugue that such composers as Telemann "long ago silenced the false opinion that the so-called gallant style did not permit a fusion with features derived from counterpoint."

More important to modern music lovers is the effect of the **lute style** of such great performers as Denis Gaultier on the early harpsichord composers of France: Chambonnières, d'Anglebert, the Couperins, Rameau. The accompaniments, arpeggiated in character, were no longer carried out in a fixed number of parts, but the texture was varied at will, governed by a nice feeling for purely instrumental sonorities. This style, often called the **rococo style,** was also characterized by a graceful use of chromatics and flowing melodic line and a charming, if sometimes excessive, use of melodic graces, turns, trills, and mordents of various kinds. The use of characteristic titles, frequently personal names, was so frequent among the lutenists that Baron can say in his treatise on the lute, "Seldom do we find a French piece which does not have the name of a gallant lady by which, if it pleases her, the piece is named." Though the style, understood in this sense, originated in France, it rapidly conquered Europe; so that we find in the treatise of Carl Philip Emmanuel Bach on keyboard performance and in the work by Johann Joachim Quantz on playing the flute perhaps the most careful and precise accounts of the genre. —C.W.H.

**galliard.** A *pre-classic* dance form of Italian folk origin which became popular in Continental and English courts during the 16th and 17th cents. The style and spirit of the dance are implicit in its name, which means literally *a gay and dashing person.* The galliard was danced in fast 3/4 meter. The accompaniment had a characteristic two-measure rhythmic pattern, in which the second beat of the second measure was omitted, giving emphasis to the jump climax of the Galliard step. Running, jumping, and kicking steps formed the basic dance, which was subject to three major variations. The earliest of these, the *tourdion,* was the most restrained, the *galliard proper* was livelier, and in the extremely vigorous *volté,* the men lifted their partners into the air at the climax of each phrase. As the galliard became the second dance in court balls, it was used by French composers as the second piece in the musical suites first written for court ball accompaniment. —J.G.

**Gallican chant.** See MEDIEVAL MUSIC.

**galop.** A very spirited dance in 2/4 time.

**gambang.** A Javanese xylophone.

**gamut.** See solmization.

**Gandhāra art.** See INDIAN ART.

**ganosis.** A process of toning down the glare of marble in sculpture.

**garba grha.** See INDIAN ART.

**garden rugs, Persian.** Among most beautiful and important rugs. The Persians spread their garden rugs on the floor in winter to surround themselves with the garden. —B.E.J.

**garden city.** See CIVIC PLANNING.

**garland.** In Roman decoration, a festoon of flowers, leaves, or fruit suspended at both ends and hanging in a curve, often from a bucranium, patera, etc.; also a rope of flowers, etc. running continuously as a border.—L.T.S.

**gatch** (Pers.). Stucco, used in architecture.

**gather, a.** See GLASS AND GLASSMAKING.

**gather, to.** *Book.* In gathering the folded sections are placed in piles in their proper order. These are then "gathered" one by one to make complete books. See EDITION BINDINGS.

**gaucho literature.** See HISPANO AMERICAN LITERATURE.

**gauze fabrics.** See weaving.

**gavotte.** A member of the *pre-classic* group of dances, had its origin among the Gavots, peasants of a region in south eastern France. A merry and active couple dance in fast 4/4 meter, it began traditionally on the third beat of the measure. The basic movement consisted of small leaping steps. After its adoption by the 16th cent. French court, the gavotte underwent a formalizing and devitalizing process until it reached an extreme of artificiality. Composers of the instrumental suite based on court ball dance music used the gavotte for the fifth or sixth piece, between the *sarabande* and the *gigue.* —J.G.

**G clef.** See NOTATION.

**geisslerlieder.** See MEDIEVAL MUSIC.

**gekkin.** See MUSICAL INSTRUMENTS.

**general ware.** See CERAMICS I.

**genius.** This word has been used so widely in so many contexts that it almost has lost its usefulness as a vehicle of precise expression. To salvage the term two steps are necessary; first, to strip it of its undesirable, confusing and scientifically erroneous connotations; second, to provide a clear statement of useful referents.

The term "genius" is not the sole property of any one discipline. Indeed, it is used as frequently by men-on-the-street as by the technical writers. Let us consider these usages. The man-on-the-street refers to his nephew as a genius if he makes his automobile function after it is apparently beyond amateur repair or performs a similarly surprising feat. In this context even slightly unusual accomplishment is evidence of genius.

In artistic usage, genius is used to connote unusual creative ability with the added emphasis upon inspired activity. The mystical assumption is often made that the genius has contained within him the art product, full grown, awaiting release through appropriate stimulation. Thus, it is assumed that, once inspired, the genius spews forth his creative offspring as a full grown product, while lesser artists must labor, revise, strive and strain to accomplish their purposes.

In many respects artistic usage converges on superstitious and semi-religious interpretations. The latter are inclined to personify the

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

quality of genius even more than artistic usage. Thus, an individual is "possessed by a genius" which may, on whim or perhaps for mystical reasons, leave him. His products are really products of this spirit which is using his body as a medium.

None of these connotations can provide a satisfactory basis for acceptance of the word as a construct for science in general and art and psychology in particular. The man-in-the-street is too inclusive, the frequent artistic and superstitious usages are too vague, and too dependent upon mysterious non-existent entities.

Formal definitions of this term provided by the *Webster International Dictionary* and *Warren's Dictionary of Psychology* which are in essential agreement, provide a more satisfactory basis for usage. Webster's preferred definition is stated: "extraordinary mental superiority; esp. unusual power of invention or origination of any kind." Warren's statement is very similar: "very superior mental ability; esp. superior power of invention or origination of any kind or execution of some special form such as music, painting, or mathematics."

However, the slight differences in the choice of words do reflect rather definite differences in use of the term. Comparison of the two statements reveals that the difference in concept is relected in the comparison of the first statements to each definition. Webster uses the phrase "extraordinary mental superiority", while Warren says "very superior mental ability". "Extraordinary superiority" is opposed to "very superior". The former implies much more atypicality than the latter. This latter statement reflects a bias in interpretation which was emphasized by Terman's definition of genius in terms of his scale of intelligence viz. an I.Q. of 140 or greater. This is a statistical interpretation of genius which is at variance with artistic usage. In the latter context, there is a decided tendency to reserve the appellation to artists and artistic works that have withstood the test of time. On the other hand, the criterion of genius as implied by Warren and Terman is that the individual or his work be sufficiently above that of his contemporaries so that only one per cent of the total population could be said to equal or better it. Further, in Terman's usage genius is treated as an inherent quality of the individual apart from any demonstration of this quality in terms of socially significant behavior. Thus, large numbers of children in this country earn the title of genius by virtue of an intelligence test performance, while artists and art critics find only a few in each generation who are worthy of the title in terms of achievements.

To gain full understanding of Terman's concept, consideration must be given to the heredity-environment question. The conception that the upper one per cent or any top per cent of individuals in performance on an intelligence test are worthy of the name genius implies that even though an extremely small proportion of them actually perform like geniuses, they are all endowed by nature to be geniuses. Those who do not earn the title by their achievements have been blocked by environmental handicaps. The opposed point of view places complete emphasis upon the individual's developmental history, and expresses doubt that all who have been rated as genius on the basis of accomplishments would necessarily score I.Q.'s of 140 or better on the Stanford-Binet scale. As a difference of opinion over the relative importance of hereditary and environmental influences, this controversy has little to offer in the direction of the better understanding of genius. It seems clear that the final criterion of genius will be accomplishment and that accomplishment cannot take place independently of either hereditary or environmental influences.

If this conclusion is acceptable, then genius can be defined as extraordinary superiority of accomplishment; esp. unusual power of invention or origination of any kind. This definition makes no assumptions with regard to the origin of the accomplishment nor the manner of procedure in the act of accomplishment. It does emphasize the exclusiveness of the quality and the characteristics of origination and innovation. Attempts to extend its meaning to include *specific* assumptions as to origin will go beyond the bounds of established fact. See Terman, L. M. et al, *Genetic Studies of Genius*, 1925; Warren, H. C., *Dictionary of Psychology*, 1934; *Webster's International Dictionary*, 2nd ed., 1934.

**geometric ornamentation.** See HELLENIC ART.

**geometric style.** This type of decoration, based on geometric patterns, occurs in the early stages of many cultures. During the 9th and 8th cents. B.C., it dominated the art of the Mediterranean world, supplanting the naturalistic curvilinear designs of the Minoan culture. It was doubtless introduced by the conquering northern invaders. Characteristic are the abstract rectilinear patterns, such as the meander, lozenge, cross, triangle, rhombus and zigzag, and the geometric schematization of the human form. The patterns appear on gold and bronze ornaments and bronze statuettes, but are chiefly seen in pottery, where they often fill the surface of vases with their firm, exact linear decoration. On more ambitious vases there are bands representing scenes of fighting, funeral rites, and mythological events, but these also were designed in a highly formalized fashion, without any spatial sense or fluid movement, and the background was often filled with carpet-like abstract shapes. Centers of this artistic production were Athens, Boeotia, Eretria, Delos, Thera, Rhodes and Argos, but the technique was universally accepted throughout the Greek world. As colonization and increasing trade brought the Greeks into contact with the Orient, where the decorative elements were more varied and naturalistic, the limitations of the geometric style were revealed, and it speedily lost favor. Yet its austere influence remained, as an architectonic restraint which guided the design of later Greek artists. See HELLENIC ART. —W.R.A.

**georgette.** Thin silk fabric, dull in texture, with crepe effect due to tightly twisted yarns in both warp and filling. Right and left hand twists alternate.

**Georgian.** A period in English history nominally associated with the supremacy of the House of Hanover under the first three Georges, from 1714 to 1820. Before its conclusion England had gained a mighty empire, survived the Napoleonic era, and embraced the Industrial Revolution. In architecture, the baroque tendencies of the 17th cent. succumbed to an academic purity which, despite incipient romanticism, became generally stricter as the century progressed and ended in a forthright classicism. The most significant names in the profession are, perhaps, James Gibbs (St. Martin-in-the-Fields in London) and John Wood (Prior Park and the Circus at Bath). But this was England's Golden Age of furniture and interior design, and even renowned are the names of Chippendale, Sheraton, Hepplewhite, and Robert Adam. See EARLY AMERICAN ART; FURNITURE. —P.C.B.

**GERMAN ART.** A historical survey of German art as it is attempted in the following pages meets with a number of difficulties because it involves the separation of a cultural-historical phenomenon from the context from which it is in fact inseparable. The particular qualities and characteristics of German art become fully clear only if German art is presented in relation to the art of other European regions which greatly influenced it in many cases. The fact that German art is treated here as an independent subject is not intended to suggest that it is an independent phenomenon and that the art forms presented here are unique, springing from sources solely within Germany.

It has been argued that the native Germanic creative ability has never been understood and properly appreciated despite the fact that it produced original and valuable works and gave to German art those characteristics which differentiate it from the art of other European regions (W. Worringer, H. Read). The dominance of the canons of taste which grew out of Greek and Greco-Roman culture is held responsible by these writers for this fact. It is of course at the present time no longer necessary to demonstrate that the standards of Greek idealized naturalism are only one of a number of possible different standards and it will be readily admitted that different criteria are needed to judge fairly different types of art (e.g. the art of primitives, children's art, etc.). Furthermore, it will be admitted that these standards are of equal value. However, admitting all this—while it makes us more appreciative of a greater variety of art forms—does not change historical facts and it is an undeniable fact that the forms of Greek and Greco-Roman art as well as the standards of taste derived from them have played a most important role in the historical development of European art

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

in general as well as of German art in particular.

There is little, if any, evidence that the early phases of Germanic art were markedly different from the primitive and archaic art forms produced in other regions or by other people. The art of the early phase consists mostly of intricate two-dimensional surface decoration which is primarily non-naturalistic. These art forms were originally brought to Germany from the Black Sea region during the period of the Great Migration. The early phases of this art of the Migration-period are common to the Southern as well as the Northern Germanic tribes. In the 8th cent., however, these art forms disappear in the South of Germany, but they are continued in Northern Germany and in Scandinavia until the 10th cent. If these ornaments are contrasted with classic Greek art, one might say that they contain strong and violent movement. However, it is not sufficient in this case to speak merely of dynamic movement as contrasted with the static restfulness of classic forms. It is necessary also to describe the peculiar quality of the movement in the Germanic ornaments because the element of movement is also contained in Hellenistic and baroque works of art. (It is necessary to make this distinction because it will be helpful in characterizing the German art of later periods). In Hellenistic and baroque art the movement seems to grow out of the organic functions of the object depicted while in the Germanic ornaments an abstract-decorative movement seems to be imposed upon whatever organic form or functions are depicted, distorting or obscuring these forms. Whether the forms of Germanic art had been developed to a point beyond which further progress was not possible or whether the advance of new influences suppressed and prevented such progress is a moot question with which we cannot be concerned here. Whatever the cause —as an independent dominant art these forms disappeared. They lived on to a certain extent in the so-called folk-art (e.g. decorations on utensils of daily use, etc.) but in the field of art the forms of Christianized Greco-Roman civilization became dominant, modified and changed by what must be assumed to be the tendencies of the earlier Germanic cultural tradition.

German art may be said to begin with the **Carolingian Renaissance** in the 9th cent. The efforts of Charles the Great to introduce into the Northern part of the newly established Holy Roman Empire the forms of Greco-Roman civilization are not without precedent. The policy of Charles the Great, however, was more deliberate and more consistent than that of others. For Germany, this policy meant that the forms of the, at that time, most sophisticated civilization were imposed upon a culture that in comparison was simple and primitive. The Carolingian Renaissance introduced into Germany not only art forms, but also themes and contents which were very alien to those who with admirable energy and sincerity strove to imitate and accept them. Due to this lack of understanding, the new forms were accepted and copied more or less indiscriminately. In the process of adaptation the sophisticated was simplified and often enough distorted and transformed into something much more crude. In the field of architecture a comparison of *S. Vitale,* Ravenna (ca. 500-550) with the *Münster* in Aachen (dedicated 805) will serve as a good illustration. In the visual arts the illustrations of the Gospel Books (e.g. the Gospel Book of Charles the Great, ca. 800), as well as ivory carvings (e.g. *Crucifixion,* ca. 870, bookcover, Munich *Staats Bibliothek*) are good examples. In summary one might say that in the Carolingian period a sophisticated painterly form of art was reduced to the levels of an archaic civilization.

From this mixture evolved slowly a tradition which determined decisively the historical development of German art for centuries to come. This tradition is basically non-classic, i.e. the accent lies upon the particular and personal rather than upon the general, upon the realistic and naturalistic rather than upon the idealized, upon the narrative and dramatic rather than the representational and harmonious.

There is no evidence in support of the claim that the German artistic tradition is racially conditioned in the sense that only the Germanic races (whatever that term may mean) were able and/or destined to create these particular art forms. As pointed out, they are the product of a combination of influences and circumstances; furthermore, it should be remembered that (if one wants to consider the racial background at all) the typical Romanesque and Gothic styles which differ markedly from German art were produced by people who were racially related to the Germans (Burgundians, Franconians, Normans). And lastly there is during the Middle Ages great similarity between the art of Germany and Southern France—a predominantly Celtic region.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

In France a continuity of contact and familiarity with Greco-Roman civilization guaranteed a better understanding of and a greater freedom with its forms and hence permitted a development which is independent and yet closer to the principles of classic style than German art; thus France was able to develop the Romanesque and the Gothic style. However, before these two styles can be discussed a phase of German art must be mentioned which lies between the Carolingian and the Romanesque period, the so-called Ottonian period. As compared with Carolingian art, the **Ottonian art** appears simpler, clearer and more archaic; it has a simplicity which accentuates essentials and seems to result from a better understanding of the themes depicted and the forms used. The phase is retrogressive in the sense that the imitatiaon of the imported style is not continued and improved. On the contrary, there is a movement away from the original models towards an archaic simplicity more appropriate to the general cultural level. The effects of the Carolingian Renaissance and French influences, however, prevented the formation of a truly archaic style.

Whether Romanesque and Gothic are the styles which (in European art) naturally follow the archaic style is a question which need not be discussed here. In the historical sequence we observe a recrudescence of archaic tendencies which shows an affinity to French Romanesque. This relationship made Germany more receptive to French influences which determined her artistic development decisively. (Cluny is one of the centers from which these influences emanate). In many respects the Ottonian phase prepared the Romanesque style and it seems justifiable to designate this stage (as some authors do) as **Pre-Romanesque** or **Early-Romanesque.** This seems permissible esp. in the field of architecture where the distinction is less clear partly because many of the cathedrals were constructed during both periods, partly because the French influences go back to the 11th cent. For this reason the Pre-Romanesque and the Romanesque architectures can be treated together for the purposes of this survey. The difference between French and German Romanesque cathedrals concisely expressed, lies in the following factors: the German structures are in general longer and narrower cf. the ground plans of the abbey church of Paulinzella, 12th cent., and Paray-le-Monial, Notre Dame, late 11th—early 12th cent.), they are higher with a steeper roof and they appear heavier and more somber; furthermore the arrangement of the towers is different. The cathedral of Speyer (begun ca. 1030, alterations ca. 1100 and after 1150) with its two transepts, its two central towers rising above the crossings and with its four flanking towers, placed at the end of the transepts, is a good example of German Romanesque. Many of the German Romanesque cathedrals can be considered as variations of this design (e.g. Worms, Mainz, Maria Laach, and others).

The tomb-relief of Archbishop Friedrich von Wettin (Magdeburg, Cathedral, ca. 1152) is perhaps one of the clearest examples of German Romanesque sculpture. A comparison of the Wettin-tomb with the tomb-relief of Rudolf von Schwaben (Merseburg, Cathedral, ca. 1080) illustrates very well the development from Ottonian (Pre-Romanesque) to Romanesque art. In the Ottonian relief, with its almost too carefully arranged symmetry and clarity of contour, the different parts of the figure are more or less equally emphasized and this lack of unification gives it an air of uncertainty which, despite its impersonal qualities, makes it appear reserved rather than monumental. By means of accentuating the essential form elements and through the subordination of the single parts to the almost cube-like simplicity of the figure, the Wettin-tomb achieves a monumentality which nevertheless contains a certain human quality entirely lacking in the Ottonian sculpture.

The cathedral of Magdeburg (begun 1209) presents the first attempt to introduce into Germany Gothic architectural principles and the Gothic portal with its statuary (see Gothic). The not very successful attempt met with great difficulties as shown by the four successive changes in the plan of construction. French ideas were more successfully assimilated at Strasbourg, Bamberg and Naumburg. An examination of the sculpture of these three cathedrals will show the characteristic traits of German Gothic which are most strongly expressed in Naumburg. (e.g. Strasbourg, figures of the Southern portal of the transept ca. 1225 and the so-called *Pillar of the Angels,* ca. 1225; Bamberg, figures of the *Portal of the Princes,* ca. 1230-1240; Naumburg, the *Figures of the Donors,* ca. 1250-1260). If compared with French works of equal rank the sculptures of Strasbourg, Bamberg and Naumburg lack the idealizing grace and elegant formality of French Gothic. On the whole the German figures seem to be filled with a certain tense energy; they are

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

stronger, more forceful and monumental than the French. Especially in Naumburg individual human qualities are presented with a strength that raises these works from the level of portraiture to that of lasting monumentality.

The different phases of Gothic art in Germany do not merely grow one out of the other, but result also from successive French influences. For the transmission of such influences three centers can be distinguished, Strasbourg, Marburg and Cologne. The earliest typical German Gothic cathedral was constructed in Marburg. With its two steeples, a system of buttresses and great, high windows and with a system of piers and arches the St. Elisabeth Church (1235-1285) shows important structural similarities to Reims, but the whole building appears more compact and severe. In the Marburg St. Elisabeth Church architectural principles are embodied which are more clearly worked out in the cathedrals of Wetzlar (ca. 1250-1350) and Paderborn (ca. 1235-1275). These cathedrals are examples of a type of construction which is known as *Hallenkirche*—i.e. a cathedral the nave and aisles of which are of equal height and which needs no flying buttresses since the thrust of the vault is carried directly by the aisles to the buttresses, with one great roof covering nave as well as aisles. Although the *Hallenkirche* is found frequently in Germany it is not a purely German invention; its antecedents can be traced to Southern France, as a comparison of the cathedral of Paderborn with the cathedral of Poitiers (1166 - ca. 1300) will show. Of the numerous examples of the *Hallenkirche* type the following might be mentioned: the cathedral of Münster (ca. 1225-1275) and the *Wiesenkirche* at Soest (Middle of the 14th cent.).

An interesting variety of Gothic architecture is the so-called ***Backstein Gotik*** (**Brick Gothic**) to be found mainly in Northeastern Germany (e.g. Lübeck, Rostock, Wismar, Danzig, Prenzlau, etc.). The cathedral of Cologne (begun 1248, completed in the 19th cent.), perhaps the most widely known, is actually the least characteristic of German Gothic, being a rather faithful copy of the cathedral of Amiens.

German art of the Renaissance (q.v.) presents a combination of European, esp. Italian, tendencies and the **German artistic tradition,** in which the latter, however, in most cases is dominant. In so far as such a complex phenomenon as the Renaissance can be reduced to simple formulas, three phases are distinguishable in the development of the Renaissance. The first phase, which is characterized by a naturalistic realism, (e.g. in Italy, Donatello; North of the Alps, Claus Sluter, Konrad Witz, et al.), means a breaking away from the elegant formalism of the Gothic style. In Germany, where the formalizing Gothic style had been accepted with reservations this first phase had a natural affinity with the native artistic tradition. The German works of this phase are considerably lacking in formal unity of composition, but they reveal a great interest in and a feeling for nature and the intimacy of human, personal experience which is of course carried into the presentation of religious themes. (e.g. Master-of-the-Life-of-Mary, Master Franke, Lukas Moser, Konrad Witz.)

In the second phase of the Renaissance which has been named Late Gothic or Neo-Gothic (beginning ca. 1450), there is a revival of the idealizing, formalizing tendencies of the Gothic. This retrogression—not restricted to the North of Europe, e.g. Botticelli, Lorenzo di Credi, Verrochio—is in Germany best represented by the sculptors Pacher, Veit Stosz and Tilman Riemenschneider. The large altars carved in wood of Pacher (*Coronation of St. Mary,* St. Wolfgang, 1479-81), Veit Stosz (*Ascension of St. Mary,* Cracow, 1477-89) and Tilman Riemenschneider (*Ascension of St. Mary,* Creglingen) are the climax of the Neo-Gothic of the 15th cent. In the Mannerism (q.v.) of the 16th cent. Neo-Gothic principles are carried to the extreme in the over-elaborate, swirling, and twisted sculptures of Master H. L. (*Coronation of St. Mary,* 1526, Breisach, cathedral), Claus Berg (*Apostles,* ca. 1532-35, Güstrow, cathedral) Hans Leinberger, and others.

In Italy the Neo-Gothic phase was followed by a turning towards classic form. In Germany the development moved in a different direction; the Neo-Gothic style was abandoned, but it was followed in the majority of cases by a modification of the naturalism of the earlier phase (of the Renaissance) and the break with the medieval tradition in favor of classic concepts was not as clear as it was in Italy. Painters like Albrecht Altdorfer, Lucas Cranach the Elder, Hans Baldung Grien, Hirschvogel, Lautensack, and others follow the tradition of Konrad Witz or Master Franke—a naive naturalism which shows lyrical qualities in landscapes and which tends to become sentimental in religious paintings.

The artistic development of Albrecht Dürer as he himself, according to Melanchton once described it, is also a reflection of the

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

progress of the Renaissance. From a naturalistic realism with great interest in the accidental, bizarre and narrative he advances to simplicity and clarity which he describes as depicted the "original face" (*ursprüngliches Antlitz*) of Nature. Dürer's early graphic work shows effects of the Gothic tradition (e.g. the woodcuts of the *Apocalypse,* before 1498)—intensity of movement and intricacy of design which later give way to greater clarity and simplicity (e.g. the woodcuts of the *Great Passion,* 1510). However, Dürer never loses the intimate and intensely human qualities which can be brought out esp. well in woodcuts, engravings, etc. because these are addressed to a single observer rather than to a large gathering of people (as an altar painting is) His paintings show more strongly the influence of the ideas of the Italian Renaissance (e.g. *St. Mary with the Finch,* 1506 or the *Selfportrait* of 1498). In the *Four Apostles* (1526) Dürer achieves a complete unity of form and content as well as the simplicity and clarity which he called the essence of Nature. If compared with contemporary Italians of equal rank (e.g. Giovanni Bellini) his figures seem to have greater strength and there is an intense, almost aggressive sincerity in the expression of the figures and faces of the four men. The robes follow the movement of the body in bold and sweeping curves with folds which are sharply and clearly cut but nowhere counteracting the movement or breaking the unity of the composition

None of Dürer's contemporaries succeeds to this degree in combining clarity and unity of composition with intensity of expression. In comparison with Dürer, Hans Holbein the Younger appears cool and reserved and his series of woodcuts, the *Dance of Death* (published 1538) seems to lack the intensity of Dürer's graphic work. Matthias Grünewald (Mathis Gothart, called Nithart) in his paintings for the Isenheim Altar (ca. 1510) combines a monumental effect with naturalistic realism, and the grandeur of forms seems sometimes incongruous with the intimate and humanizing tendencies in the conception of the religious themes. In the *Crucifixion* (of the Isenheim Altar) the human suffering is depicted with an almost brutal realism which contrasts strongly with Gothic beautification, but which lacks entirely the dignity and noble simplicity of Dürer's art.

In architecture the ideas of classic Renaissance were even less assimilated than in the visual arts. This fact is important not merely in regard to the classifications of so-called Renaissance architecture, but also because it explains the different character of German art and architecture of the baroque and rococo period. When analyzing the character of movement in Germanic ornaments the exaggerated organic movement of Italian baroque was distinguished from the abstract-decorative movement imposed upon organic forms. As pointed out above, the Renaissance (in the first stage) means the overthrowing of the conventionalized formality of the Gothic which then in Italy was replaced by the discipline of classic form. In Germany the Renaissance movement was instrumental in overcoming the formal Gothic style (accepted with reservations anyway), but since the classic principles were not widely accepted the baroque art in Germany meant a dominance of the German tradition (i.e. dominance of abstract-decorative tendencies) modified through Italian influences. Besides this art developed within Germany there are works of art in a baroque style more or less directly brought from Italy (e.g. Andreas Schlüter's equestrian statue of the *Great Elector* in Berlin, 1698-1703).

In architecture the 16th and early 17th cent. is the period of the town halls, guild halls, and stately burgher houses. The town halls in Rothenburg, Bremen, the *Salzhaus* in Frankfort, the *Essighaus* in Bremen, the *Zeughaus* in Danzig, the *Rattenfangerhause* in Hameln, and many others in Nürnberg, Hildesheim, Halberstadt, Braunschweig, Münster, etc., are typical for this period. These buildings were monuments of the rising power of the German cities. With all their elaborate richness and enjoyment of detail they have a homelike quality but they lack the impressive dignity of Italian Renaissance architecture.

Around the turn of the century architecture becomes somewhat more simple and unified as a comparison of the *Otto-Heinrichs-Bau* (1556 - after 1560) with the *Friedrichs-Bau* (1601-1607) of the Castle of Heidelberg will show.

It is futile yet tempting to speculate what course the artistic development in Germany might have followed if it had not been interrupted by the Thirty Years War; whether for instance the cities might not have become centers of a culture similar to that of the Netherlands. The outcome of the Thirty Years War brought the rule of numberless absolute princes who were anxious to model their courts after that of Versailles. The palaces built as a result of such desire for imitation are variations of the castle at Versailles (e.g.

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

*Solitude* near Stuttgart, the Castle at Münster, *Sanssouci* near Potsdam, the palace of the archbishop at Würzburg, etc.).

The Royal Castle in Berlin (begun 1538, remodeled 1698-1706 by Andreas Schlüter), a Prussian version of an Italian palace, is a good example of German baroque. The somber façade of the heavy cube-like structure is somewhat enlivened by the vertical rhythm of the window arrangement. On the southern part two huge groups of columns are set into the building interrupting the facade yet adding to the forbidding heaviness of the whole building rather than enlivening it. The buildings of the Dresden *Zwinger* (1711-1722 by Matthäus Daniel Pöppelmann), arranged around a square, have an elegance and an elaborate richness of decorative ornaments diametrically opposed to the sobriety of the Berlin Castle. The *Zwinger* is typical for German rococo (see rococo), which has less clarity and unity than the French, but which shows instead a greater variety of and emphasis upon individual parts—resulting in a more friendly if sometimes somewhat heavier appearance. In church architecture there is, besides direct Italian baroque influences, a tendency to return to the type of the *Hallenkirche* of the Gothic. The *Wallfahrtskirche* in Vierzehnheiligen (J. B. Neumann, begun 1743) presents this kind of rococo architecture very clearly. The strict cross-shaped ground-plan of the Italian baroque churches (e.g. *Il Gesù*) has been transformed somewhat in the manner of the early German churches, thus creating a high and wide nave to which aisles as well as transept are subordinated. Any reminiscences of medieval gloom are removed through the lightness and richness of the rococo decorations.

The breaking away from the formalized conventions of the rococo during the ***Sturm und Drang*** **(Storm and Stress)** period (latter part of the 18th cent.) and the movement towards a new natural humanity meant in Germany that the native artistic tradition came more strongly to the fore. The majority of the German rococo painters were bourgeois, and they had transformed the art of the court of Versailles into something rather sober and simple (e.g. Daniel Chodowiecki's paintings are carefully recorded reports of garden parties of a most honorable society). In the paintings of Chodowiecki and his contemporaries (e.g. J. A. Herrlein, J. K. Seekatz, J. L. E. Morgenstern, et al. there is a certain conflict between the accentuation of the human figure in the composition, the graceful curves of the design, the play of light and the simple pleasures and events which are depicted. Their art already contains elements of the new natural humanity proclaimed as the aim of Classicism and Romanticism. However, the new natural state to be achieved is an intellectual product, a sentimentalized fiction—all these natural men, the peasants or savages, are noble, sensible and sensitive. Nature and natural beings are invested with all the feelings of those who are seeking this better state, nature is approached sentimentally and as a consequence is itself sentimentalized. Classic antiquity is approached with the same attitude, to be classic is to be natural. It is a sentimentalized classicism, particularly in Germany, and we witness the strange contradiction that the art from which the very idea of form is derived is used in a romantically transformed fashion to protest against an art considered to be artificial because it is formal. The opposition between Classicism and Romanticism of the late 18th and the 19th cent. is actually no conflict at all. The classicism of Ph. Fr. Hetch, of A. J. Carstens or of G. Schadow is a romantically distorted version of classic antiquity—it is the same honorable sobriety of Chodowieck only in classic robes, narrative rather than representative, intimate rather than great, and nobler in the intention than in the execution. On the other hand the so-called Romanticists' manner of painting has many of the characteristics of Classicism. For instance in Gottfried Schick's *Portrait of the Daughters of Wilhelm von Humboldt* (1809) the forms are contained within a clear contour and the two children are placed in the center of the composition before a landscape which widens into indefinite distances. The romantic sentiment is depicted in the soulful look and expression of the faces and repeated more clearly in the landscape of the background. The same holds true for the paintings of Philipp Otto Runge. The contemplative gaze of the figures in *We Three* (1806; destroyed 1931 in the fire of the Munich *Glaspalast*) is not directed towards the observer but goes beyond him; it expresses the vague and indefinite longing for something which one feels rather than knows, a desire to be in harmony with the rhythm of the universe. There is a conflict between the clearly painted figures in the foreground and the romantically treated landscape. Caspar David Friedrich overcomes this conflict by abandoning the human figure as a primary and independent carrier of emotions His men are completely part of

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

the landscape; they are subordinated to it. Together with trees shrubs, with ruins or with masts of boats the figures form a part of the foreground. By means of accentuating the foreground a framework is created through which the observer perceives the landscape; often he surmises rather than sees it beyond the framework and by emphasis on the foreground the landscape seems to become more vague, wide and indefinite (e.g. *Cliffs of Rügen* ca. 1820).

In Friedrich's *Stimmungs*-landscapes the feeling for nature and the new natural state of existence is expressed in and by means of the landscape itself; nature has become the carrier of the romantic sentiment. The feeling of longing and expectation which Runge and others narrated by means of the expressions in the faces and the attitudes of men are expressed by C. D. Friedrich through selecting moments and situations in nature which arouse expectation and in such a manner as to leave it to the observer's imagination to complete the scene. For instance in *Before Sunrise* (ca. 1811), *Sunrise near Neubrandenburg* (1820-1830, not completed), or *Morning in the Riesengebirge* (1811), the morning has not yet come—the rising mist, the first rays of the sun reflected on the hills or buildings, make us expect the arrival of the morning. By creating such a suspended state of emotion filled with expectation of that which the observer imagines will occur, C. D. Friedrich satisfies the criteria of the aestheticians of Romanticism who requested an art which taught them to "feel their feelings" (Wackenroder).

Neither Friedrich's contemporaries nor the painters of the later phase of Romanticism attempt to embody the elusive quality of the romantic sentiment in nature itself. The vagueness and the indefinite feeling of which Runge's men seem to dream, the emotions which Friedrich suggests and indicates in a pantheistically enlivened nature is in the later phase crystallized and directed towards a definite and historically located aim. A goal is set for the romantic longing—the Middle Ages, i.e. a sentimentalized Gothicism and with it a romanticized Catholicism (e.g. the brothers Schlegel, Wackenroder, Philipp Veit) as illustrated by the historizing and symbolizing narratives of Fr. Pforr, J. H. F. von Olivier, Schnorr von Carolsfeld, and others. While these painters present their stories as sentimental idyls, the **Nazarenes** (q.v.) (P. von Cornelius, Philipp Veit, Friedrich Overbeck) attempt to set forth their ideas in monumental form. The result (e.g. the frescoes of the Casa Bartoldi) is a compromise between Renaissance forms and romantic religious sentiment inspired by medieval mysticism. The change of sentiment finds expression in a type of painting in which nothing is left indefinite. The landscape is clearly presented and limited by a distinctly drawn horizon of hills or houses and the religious or historical scenes are recorded with great care and accuracy. The romantic interest in and feeling for nature which in this later phase of Romanticism is somewhat hidden behind the historical religious and symbolic themes comes to the fore again (ca. 1830) in the art of the **Biedermeier** (q.v., also Düsseldorf, school of) expressing itself in careful studies of natural forms and in a preference of simple themes and people.

In the art of the last decades of the 19th cent. general ideas and idealized forms are emphasized instead of the natural and intimate qualities of Romanticism. However, the artists of this phase—Böcklin, Feuerbach, H. von Marées, Leibl, Thoma, et al.—do not overcome completely the sentimental naturalism and realism of the previous phases and their art contains a great deal of the motifs and themes as well as of the sentimental approach of the Romantic and *Biedermeier* art. However, their paintings contain also certain elements which seem to point towards the new art which follows and in this sense the art is transitional. In the selection of themes idealized and heroic figures of classic antiquity, Christian mythology or early history are preferred and instead of the anecdotal narrating of incidents the general and symbolic meaning of the figures and events is emphasized. The themes are painted in a style that aims to be monumental and representative. The unity of man and nature, so important to the Romantics, is dissolved and a type of composition is introduced in which the human figure stands out clearly from the background to which nature, i.e. landscape, etc., is relegated. The important factor as far as the development of the new art is concerned is that compositional principles are emphasized again. The forms of nature while they are subordinated to the theme of the composition are also subordinated to artistic principles of composition—by becoming decorative this art turns away from the *Biedermeier* imitations of nature.

German **Impressionism** is closely linked to the names of Max Liebermann, Max Slevogt, and Lovis Corinth. Liebermann's early work is related to the art of the previous phase inasmuch as he, like Leibl, paints peasants

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

or workingmen unsentimentally and simply. Unlike Leibl, however, he does not stylize these figures nor does he build his composition around them. Somewhat like Menzel, Liebermann presents momentary action, the moving about of people of whom he seems to have become aware more or less accidentally. On the other hand Liebermann paints his people as well as the space in which they move quite differently. The people are observed with the same detached interest with which other objects are considered. Thus in overcoming the sentimentality of the 19th cent. Liebermann's paintings become at once more artistic and more realistic in the portrayal of workingmen. A comparison of Liebermann's earlier works (e.g. *Shoemakers,* 1881) with some of the later pictures (e.g. *Poloplayers,* (1903), will show that he became increasingly interested in the artistic problems of depicting movement and delicate and most subtle color gradations. Influenced by Degas, whom he considered the most gifted of modern painters, Liebermann develops a technique by means of which figures and objects alike seem to be dissolved in vibrating light and atmosphere. Max Slevogt, 21 years younger than Liebermann and since ca. 1900 working in Berlin with him, shows great similarity to Liebermann's impressionism. In clear, light and glowing colors with a vibrant atmosphere he paints portraits, scenes from race courses or from the theater, of which *D'Andrade as Don Juan* (1902) is a brilliant example. In his early pictures Lovis Corinth shows a delicacy of color and a lightness of tones equal to that of Liebermann or Slevogt, but in the course of his artistic development his painting becomes broader, heavier, and his colors less transparent (e.g. *Nude,* ca. 1895, formerly Bremen *Kunsthalle*). He is more radical in dissolving the human body or the forms of nature into masses of color; most intensive and revolutionary in this respect are his *Walchensee landscapes.*

Of a group of artists concerned with the proletarian milieu Käthe Kollwitz is the only one who formulates a sharp protest against social conditions which she considers wrong. Her etchings and drawings have the rousing quality of political pamphlets; her artistic ability prevents her from becoming sentimental.

Modern art in Germany is usually classified into two movements. *Expressionismus* (see expressionism) and *Neue Sachlichkeit* (see New Objectivity). The art of Gauguin, van Gogh and Edward Munch and of the French moderns exerted great influence upon the development of German expressionism. The difference between the German modernists and their French contemporaries might be seen in the greater individual variety which results in the formation of a number of "schools" and groups within German expressionism. The expressionists are also more radical in the deformation and distortion of natural forms. However, the expressionists do not aim for purely aesthetic-artistic creations; the accent lies (according to their declared aims) on the "expression of the innermost soul," the "thing as such," etc.

Of modern German sculptors Wilhelm Lehmbruck achieves with thin and elongated figures an expression of graceful movement and clarity of contour (e.g. *Kneeling Woman,* 1911; *Ascending Youth,* 1913). Rudolf Belling is the only non-naturalist and truly experimental sculptor; he reduces figures to simple and sharply cut cubes by means of which the various axes of space are explored (e.g. *Triad,* 1919). In his metal portraits Belling achieves most startling effects by means of a combination of naturalistic elements with abstract construction (e.g. *Portrait of J. von Sternberg,* 1930). In comparison with Belling, Georg Kolbe and those who follow more or less his trend (G. Marks, de Fiori, Scheibe, E. Scharff) appear conservative. Kolbe's early work shows the influence of Rodin, from which he freed himself later. His figures have a quality of reserve and restraint even when movement or strong emotion are expressed (e.g. *Grief,* 1921; *Descending Woman,* 1927).

The strongest of modern sculptors and probably one of the greatest German artists is Ernst Barlach. Barlach's art has been described as Gothic (e.g. H. Read), presumably indicating a German quality in his sculpture. Such a description, however, is quite misleading since Barlach's work shows no similarity to the gentle and graceful figures of Reims or Strasbourg. Barlach's figures, usually shrouded in heavy cloaks, are reduced to simple geometrical shapes; the few folds of the garments are straight and clear-cut; they support and emphasize the expressive qualities of the figures without counteracting their organic forms or movements. The heavy vigor of Barlach's figures comes out most strongly in sculptures in which movement is depicted, as for instance in the *Avenger* (1923) in which every part of the figure contributes to and seems to be compressed into the forward rush. If one wants to discover peculiarly German

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

characteristics in the vigorous expressiveness of Barlach's figures the observer must consider the fact that the formal values of his sculptures are not sacrificed to the expression and that Barlach, in fact, achieves often enough a complete unity of content and form seldom found in the non-classic German tradition. The geometric simplicity is probably explainable from his position within the development of 19th and 20th cent. art and should not be simply put down as a Gothic, Nordic or Germanic quality. Barlach is closer to the Dürer of the *Four Apostles* than to the intricacies of Veit Stosz, Pacher or other Gothic artists.

It would be a grievous omission to neglect the development of architecture and industrial design of the 19th and the 20th cent. in this survey. No new architectural style was created in the Romantic period. In Berlin Karl Friedrich Schinkel built the *Neue Wache* (1816-18), the *Schauspielhaus* (1818-21), the *Altes Museum* (1822-28) in an austere classicism after the architecture of early Italian Renaissance (among his designs imaginative Gothic constructions can be found, e.g. the projected mausoleum for Queen Louise of Prussia, ca. 1810). A similar cold and rather academic classicism was inaugurated by Leo von Klenze in Munich (e.g. the *Glyptothek* [1816-30], the *Propylaea* [1830-42]). The classicism of Schinkel and Klenze was the basis for the official architecture of the later 19th and the beginning 20th cent. The newly founded German Empire of 1871 adopted as its official style a bombastic mixture of classicism and baroque (known as *Neudeutsche Renaissance*) of which the *Reichstag* (1884-94, by Paul Wallot) and the Cathedral of Berlin (by Raschdorff) are characteristic examples.

While Germany thus was being covered with courthouses, postoffices, theatres, etc. in New German Renaissance style and with churches in a pseudo-Gothic style a new architecture developed that was first applied to buildings which were the expressions of the new needs of a changing social-cultural structure, such as department stores, factory buildings, railway stations, etc. (e.g. *Departmentstore Wertheim*, Berlin, 1896-1904, by Messel; power station of the A.E.G., Berlin, 1909, by Peter Behrens; *Fagus Boot-Last Factory*, Alfeld-on-der-Leine, 1911, by Walter Gropius and Adolf Meyer. This new movement in architecture and the applied arts known in its beginning as *Jugendstil* (q.v.) is the basis for modern architecture and industrial design. Artists, engineers, manufacturers, designers, writers, etc., interested in furthering and integrating the efforts and experiments of the various groups among the moderns, founded in 1907 the *Deutscher Werkbund* (q.v.), an organization which exerted a great and far reaching influence upon the development of modern style.

One of the most important phenomena of modern Germany and the outstanding exponent of the new spirit in art and architecture was the *Bauhaus* (q.v.), an educational institution as well as a center for experiments and research which extended its influence far beyond the boundaries of Germany and played a decisive role in the formation of a new European style.

The beginning of the Hitler government is the end of German culture. In the visual arts and in architecture a gruesome mixture of a forced-academic classicism and a frightfully sentimental and stuffy *Biedermeier* is proclaimed as the official and only permissible style. Imitations of Klenze's classicism (e.g. the Munich party buildings), hundreds of square yards of canvas filled with marching elite guards, green forests, fertile fields, fertile peasant women, symbols of fertility, and enthroned above all Herr Hitler in shiny armor on horseback bearing the party flag, are the results of this government-regulated art. At the same time the works of Ernst Barlach, Franz Marc, Paul Klee and those of many others are condemned as "degenerate art." One may or may not approve of modern German art—it is impossible to approve of the methods used to suppress it. A total lack of understanding of German cultural history is revealed by the establishment of the above described official style which is as futile as the methods of its enforcement are barbaric.

It is a tragic irony that at the moment when Germany for the first time in the history of art was taking a leading part in the creation of a European style the *Bauhaus* and all the achievements and hopes for which it stood were destroyed. See F. Adama van Scheltema, *Die altnordische Kunst*, 1923; G. Biermann, *Deutsches Barock und Rokoko*, 2 vols., 1914; G. G. **German glass.** See GLASS AND GLASSMAKING.

**German porcelain.** See CERAMICS II.

**Gesamtkunstwerk** (Ger.). See universal artwork.

**gesso.** A mixture of chalk and glue applied to a panel to furnish a painting surface. It takes a smooth polish and gives brilliance to pigment applied over it.

**gestalt psychology and music.** Ever since its origin by C. v. Ehrenfels, (1890) the theory of a gestalt—a configuration that has more qualities than the sum of the qualities of its parts—used music as one of its most convincing examples.

Obviously the sensation of a melody is much richer than, and entirely different from, the sum of tone sensations. Thus the melody served as the classical example of a gestalt in time. The main representatives of this theory, W. Köhler, M. Wertheimer, E. v. Hornbostel, G. W. Hartmann, K. Koffka, were gifted with special musical understanding; and such contemporary musicologists as E. Kurth, H. Reichenbach, F. M. Gatz, and H. Eames applied the results of this theory to musicology. Not only the melody but also rhythm, harmony, and form in music have to be evaluated as gestalt.

However not every musical performance enjoys the quality of gestalt. Oriental dinner music or the incessant radio are permanent background and not a figure distinguished from a background. In that respect they are comparable to colored wallpaper. But if on the wall there is a picture in a frame the design requires gestalt quality. The frame of a piece of music is the silence before and afterwards. Beethoven's request for a devoted silence before and during his playing was new to the Vienna aristocracy which used to regard music as social background.

We must regard musical form as a gestalt of higher order in that its components themselves have the quality of gestalt: the movements of a cyclic form, the parts of a song form, the themes, cadences, rhythmical patterns, etc.

The amount of gestalt quality is a direct measure for the perfection of a composition. Classical composers excel in integration as well as differentiation of the gestalt, although some stress its closeness, others its richness. Their eclectic followers developed, at most, one of these two qualities. Popular music of all times is esp. strong in closeness, and is therefore easily memorized.

Experimental investigations of music on the basis of this theory promise to furnish further valuable information about the psychology of music, the elements of listening, the logic of compositions, the act of performance, as well as the discovery of the best means for musical education. —H.R.

**gesture** (L *gestus,* a thing done, an act). (1) Visible action of the human body, preponderantly by use of head and arms, conveying a mimetic or associative idea. In ballet, gesture serves to relate purely danced portions of the action by visual statements of psychological reference, in dumb-show. By physical and literary association, love is indicated by hand on heart, grief by attention to the eyes, vengeance by menacing with the hands, etc. (2) That quality in an object which stimulates the artist to draw. See drawing.

**Ghent school.** An important 15th cent. school of miniature painting in Ghent including such famous families of miniaturists as the Bininks and the Horenbauts. The school also produced competent painters such as the vigorous realist Hugo van der Gos.—R.L.W.

**Ghiordes knot.** Sometimes called Turkish—used in the weaving of oriental pile rugs. Two loose ends project between adjacent warp threads and two warp threads are included between adjacent pile ends. See ISLAMIC ART. —B.E.J.

**ghost writer.** One who prepares literary or artistic material for another person for issuance or publication as his own. The vogue of the 'big name' in newspaper and magazine offices led editors to assign skilled reporters to prepare copy purporting to reflect the thoughts and experiences of a famous person. Although amanuenses and literary assistants had done work of this character since the beginning of writing, the practice of ghost writing became notorious in U. S. sports, politics, and industry after 1918. —H.R.W.

**gift books (annuals).** Well printed and ornately bound, these books contained a variety of prose and verse together with a series of engravings. Adapted from the almanac, these annuals served as Christmas presents and as symbols of elegant taste. The first was *Almanach des muses,* published in 1765 in Paris. The idea spread to Göttingen five years later, where was issued a *Musenalmanach,* and soon thereafter to England. In the U.S.A. there was a great vogue of annuals between 1825 and 1860. Generally the books were for ladies; the contents were sentimental, exotic, romantic, while the drawings were emotional and unrealistic. Painters, engravers, and authors often found outlets for their work, as well as a fair income, for contributions to these resplendent publications. Although famous names like Hawthorne's are represented, the artistic and literary importance of the annual is small; these books symbolize the garish middle class taste of their era. See Ralph Thompson. *American Annuals & Gift Books, 1825-1865,* 1936. —H.R.W.

**gift cloths.** See TAPESTRY.

**gigaku** (Jap.). A classic dance, now rare, in which masks are worn. See JAPANESE ART.

**gigue.** (1) Old name for viol. (2) The *gigue* or *jig* is an ancient dance form native to nearly all European peoples. Since the French and other courts of the 16th and 17th cents. made it an elegant ballroom dance, the gigue is included in the list of *pre-classic* forms. After this transmutation, French composers used gigue music to close their instrumental suites, finding that the rapid eighth-notes grouped in threes and the rollicking gigue spirit gave a lively finish. In spite of its life among the courtiers, the dance retained much of its native vitality and survives today in folk-dance form. One 16th cent. authority described the court gigue as "resembling . . . the dances of savages." The rapid and vigorous footwork typical of the dance were apparently retained in an only slightly more refined manner. See Irish jig. —J.G.

**gillotage, gillotype.** A type of mechanical photography for reproducing line drawings.

**gilt.** *Book.* The gilding on a book, including covers and edges.

**gingerbread.** See POST-REVOLUTIONARY ARCHITECTURE AND DECORATIVE ARTS IN THE U.S.A.

**ginger jar.** A popular name given to a bulbous jar with cover in which the Chinese store preserved ginger.

**girder.** A principal horizontal beam, or a compound structure acting as a beam, receiving vertical load and bearing vertically upon its supports. —J.M.M.

**girouette** (Fr.). A weathercock.

**glair.** See egg tempera.

GLASS AND GLASSMAKING. Glass is an amorphous, brittle, hard substance which has passed from the liquid to the solid state continuously and with sufficient rapidity to prevent the forming of crystals in solution. It is usually transparent and colorless, but may be colored and also either translucent or opaque. It is produced by the melting or fusing together of acidic oxides such as silica, oxide of arsenic, boric acid, oxide of antimony and phosphoric oxide, or, more frequently, by the fusion of both acidic and basic oxides, the latter of which soda, magnesia, potash, lead oxide, lime, zinc oxide, barium oxide and alumina are the most common.

The three basic kinds of glass are **green glass,** glass of soda, and glass of lead. Green glass is glass in its natural color, neither colored nor colorless, used mainly for bottles and flasks. It is generally made from coarse, rough materials, less pure than those used for the other, finer kinds of glass. **Soda-lime glass,** sometimes called **alkaline,** is used today in windows and in certain types of bottles and other inexpensive vessels. It is of ancient origin and was made by the Egyptians with approximately the same formula as is used today. The first glassmakers in this country made soda glass to a great extent because lead oxide was not available and potash, easily obtained from wood ashes, could be used as the source of alkali. Now, however, **lead glass** has won preference, especially for delicate work. Lead glass is also known as **crystal,** or, more recently, as **flint glass.** It can be blown with great ease as compared to the older type of alkaline glass, but is more expensive. The addition of lead, a 17th cent. English discovery, makes the glass softer for cutting, and adds to the luster and clear, full ringing tone of the glass as well as to the quality of refraction.

*Glass Composition.* The composition chosen in making glass depends upon the cost of ingredients and manufacturing, and upon the properties desired in the glass:—the stability

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

and durability, the rate at which it hardens, the ease of melting, and the service the finished piece must perform. The **batch**, or mixture from which the glass is to be made contains, first of all, the fundamental materials, (sand, soda ash, red lead, lime), together with **cullet** which is the waste glass left over from a previous melting. Sometimes between twenty and eighty per cent of the total batch is made up of cullet, for it assists in the melting of the materials and lowers the cost of the composition. The proportion to which the basic ingredients go to make up soda-lime glass is approximately: silica, 70 parts; soda, 14; lime, 13; and alumina, 3. In flint glass it is: silica, 54 parts; lead oxide, 32; potash, 12; lime, 1; and alumina, 1. To these basic materials and the cullet are added either a reducing agent, as carbon, or an oxidizing agent, such as sodium or potassium nitrate. This is to prevent the lead oxide, e.g., from melting into metallic lead instead of fusing with the other ingredients.

*Coloring and Decolorizing Agents.* Glass-making ingredients are seldom found in a pure state. The impurities contained in each tend to taint the glass unless some decolorizing agents are used to neutralize them. The most successful of these are manganese and arsenic, but nickel oxide and selenium are also employed.

In some glass, color is a requisite, and is obtained by the addition of various metallic oxides, depending upon the color desired. The common coloring elements are iron oxide for amber, brown, and black; nickel oxide for brown and yellow; cobalt oxide for blue; chromium oxide for green and yellow; manganese oxide for purple; copper oxide for green and blue-green; and uranium oxide for orange and yellow. Combinations of various oxides produce secondary and other colors. What color is actually obtained depends on the quantity of oxide or oxides used, the composition and consistency of the glass mixture, the length of time the batch is heated, the temperature and the gases in the melting furnace.

*The Process of Glassmaking.* The raw materials are melted together in either a **pot furnace**, in which any number of from three to fifteen containers are set in a single furnace, or in a **tank furnace** where the tank serves as one main receptacle. The pots used in the pot furnace are made from fireclay and may each hold from fifty to about twenty-five hundred pounds. Before the ingredients are put into these pots they are heated for about a week at a temperature of over a thousand degrees Centigrade. The raw materials are then put in and heated for anywhere from twelve to thirty-six hours, or until they are melted together forming liquid glass or **metal.**

Bubbles have been forming on the surface of the melting glass during this process and must be removed. One good method used is thrusting water-soaked blocks of wood into the metal. As the steam generated by this wet wood rises it takes out the gas bubbles. The temperature of the metal is then gradually lowered until the glass has thickened slightly and has reached a workable consistency.

The method in the tank furnace is somewhat different in that it is a continual process twenty-four hours a day. During this time the raw materials are constantly fed into the furnace at one end and the metal drawn from it at the other.

*From "Metal" into Glassware.* Glass blowing is one commonly employed method for making articles from the molten glass. First a ring shaped piece of clay is floated in the top of the hot metal to keep a spot clear from the scum which forms when the metal boils. One of the workers in the factory dips an end of his blow-pipe into this clear spot and gets a **gather** or small amount of hot glass which adheres to the pipe. Then putting the other end of the pipe to his mouth, he blows, forcing the glass to increase in size like a soap bubble. During this time he has been rolling the pipe back and forth continuously on his work bench to keep the glass bulb as circular as possible. Then he swings the pipe through the air letting centrifugal force help stretch the glass further into shape, and passes the pipe on to another worker. He, in turn, gives the glass further shape, adds the handles, and so on. He has to reheat the glass to keep it in a workable state. He does this either by dipping the glass into the hot metal for another coating, being careful meanwhile that the whole glass ball does not slip off his pipe and back into the furnace, or else by putting the glass into a small reheating oven called the **glory hole.** When the glass is reheated he blows it a little more and then rolls it on the **marver,** or flat, oiled marble slab, so that the thickness of the glass ball is consistent throughout. From this hollow bulb of glass can be made bottles, Christmas tree ornaments, dinner glasses, and vessels of various sizes and shapes. In making a goblet, for instance, a small portion of hot glass is fastened to the bottom of the glass bulb

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

and is pulled out forming a stem, the glass being rotated continuously during this process. To this stem is fastened a smaller bulb of glass, separated from its own blow-pipe. The small bulb, still hot, is pressed against a flat iron and rotated until it forms an almost flat disc. An iron rod, or **pontil**, is fastened to the bottom of this flat disc for handling the glass, as the large bulb is separated from its blow-pipe by breaking it very near the point the bulb joins the pipe. The glass is reheated and worked until the desired shape is obtained, after which the edge of the flat disc base and the lip of the round glass goblet are cut with scissors and fused. Occasionally the edge of a vessel is cut by scratching the glass with a diamond point and then using a series of small horizontal flames around the glass on the scratched line. A crack soon starts and follows the line around. The edges are then rounded off with a flame.

Another technique for making articles from the hot molten metal is that of **mold-blowing.** After the craftsman has obtained a gather of glass from the furnace and blown a slight glass bulb, he places the hot bulb into the bottom half of a cast iron, or in some cases a wood mold, hinged the top half of the mold down, and blows his blow-pipe until the hot glass has completely filled every corner and crease in the mold. After allowing the glass to cool and harden, the mold is opened and the glass taken out and finished. Sometimes, to prevent the glass from being scratched, a paste of some sort is spread on the interior surface of the mold before the glass is blown in it. This is called a **paste mold.**

A third process of working with glass is **glass pressing.** It is like mold-blowing in that molds are used, but unlike it in that the glass is not blown before it is put into the mold. A quantity of hot metal is put into the mold and an iron presser or plunger is trust down, forcing the hot glass into all parts of the mold. The glass pressing process is now used on a mass-production level, molds being rotated mechanically under the plungers.

Some glass is **rolled** out in flat sheets for plate glass, reinforced glass, and wire glass. The hot metal is poured from the furnace on to large, flat tables upon which has first been scattered a layer of sand to prevent the glass from adhering. On these tables are mounted rollers which run the full length of the table rolling the glass out into thin layers approximately one-half inch thick. Each roller is slightly rough to prevent the hot glass from sticking to it. The next step, **annealing,** plays a big part in glassmaking. If a piece of glass is cooled too quickly it will, of course, crack or break into hundreds of pieces. And so the sheets of rolled glass are passed on through the annealing furnace where they are cooled gradually. When cool the plate glass is ground, using iron tools for grinding and sand and water as abrasive. After this the glass is placed on felt so as not to scratch the one side while the other is being polished with water and rouge. Another process is also used, the **Bicheroux process,** in which the glass is rolled between two smooth rollers. This cuts down on both the time and expense of grinding the glass.

More complicated than glass rolling is the process of **drawing glass** which is used mainly for making glass tubing, but also for making some plate glass. The metal is put into a shallow container and a blowpipe lowered into it. When some hot glass adheres to the pipe, it is steadily raised out of the container, the glass being constantly drawn up also. Tubes or cylinders can be made up to three feet in diameter and about thirty-six feet long. For plate glass these cylinders are split and flattened in a hot furnace.

*Glass Decorating.* Besides coloring the glass, decoration can be obtained through glass cutting and engraving, sand blasting, etching, and through the process of spun glass. Glass cutting is done in one of two ways,—either **intaglio** or **relief cutting.** The former is used most often and consists in the decoration being cut into the surface of the glass. Relief cutting, on the other hand, is more difficult, for the glass surface is cut away leaving the decoration projecting out. In cutting or engraving, the pattern is first traced on the glass with chalk or quick drying ink and is then roughly cut out by holding the vessel against a rotating disc of iron called the **wheel.** A constant stream of sand and water runs onto the wheel during this process, the sand doing the actual cutting under the pressure of the metal wheel, and the water washing away the sand and glass particles. After the areas of rough work are ground away, the glass vessel is finished up much more carefully on the smaller engraver's wheel, this time of copper instead of iron. The size of copper wheel used depends upon the fineness of detail desired; the wheels themselves vary from four inches in diameter down to about one-sixteenth of an inch. It is in this process that both artistic and technical skills are needed,

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

for the engraver must know how to execute the design so that the finished product will be one of perfection The designs cut or engraved on glass must be such that they go with the glass medium. Light, airy, clear designs which follow the form of a circular transparent object are what is desired and not weighty, heavy decoration, nor that which should only be seen from one side on a flat surface. Only by having the high quality design to work with can the engraver turn out a masterpiece even though he has developed his technique very well. After the glass is both ground and cut it is polished with emery powder or with a small disc of metal or wood called a **burnisher**

Another technique for decorating glass is that of **etching**. The parts of the glass which are not to be eaten away by the acid are first covered with a mixture of asphalt, beeswax, resin and turpentine. Then the glass is put into an acid solution containing one part of hydrofluoric acid to four parts water. Different variations in the portions of acid used give different etched effects, such as dull, rough finishes, or semi-smooth ones.

With the use of the **sand blasting process**, a slightly irregular matt surface is obtained. A metal stencil of the design is made and placed against the glass. Sand is then forced through the stencil and against the glass, wearing down the glass surface where it is exposed through the stencil.

The most complicated technique for decorating glass, however, is that of using **spun glass.** A small quantity of colored glass is rolled out with an iron rod on the marver until it adheres to the sides of the rod, the whole of which is then dipped into transparent glass and cooled. The iron rod is now covered with a layer of colored glass and a layer of transparent glass over that. The iron is then removed and the hollow shell of glass heated and pulled out into a long, thin string about one tenth of an inch in diameter. Long threads made this way are then cut up into shorter pieces. A number of these threads are arranged around the inside of a clay vessel the shape of a drinking glass. Sometimes they are alternately all clear and colored threads; sometimes there are two or three colors alternating; sometimes there are three or four colored threads on one side and the same number directly opposite with clear threads in between, and so on. The way the threads are arranged, determines the pattern of the glass. The center of this clay vessel is next filled with clear glass which fuses the threads all together This piece of glass is then removed from the jar, stretched out until it is thin as a fine thread, all the time being twisted to form a rope-like pattern. Occasionally a number of these twisted threads are, in turn, put inside a mold of some sort and a glass bulb blown inside them, fusing them together and making a decorative dish or vessel. There are many variations of this technique that are used in making ornamental glass.

*The History of Glass.* The exact origin of glass is not known. We cannot tell when or where it was first discovered, nor whether it was deliberate or accidental. Perhaps the Egyptians are responsible, for the earliest definitely dated glass vessels which have survived to this day came from Egyptian tombs of the 15th cent. B.C. They were merely a kind of opaque paste made into beads, charms, etc. Perhaps the Phoenicians first discovered how to make glass and brought their invention to Egypt. We are not sure. But the discovery that glass could be blown did not take place until the beginning of the Christian era. This event, which took place in the Phoenician city of Sidon, brought about a change in glass in every respect. It was now translucent and transparent instead of being opaque; it could be made into shapes and sizes never before possible, and could be made more quickly. Knowledge of the possibilities of glass spread rapidly up into Europe, and particularly into the Rhineland where places like Cologne and Treves produced high quality, artistic glassware between the 2nd and 4th cents. By this time almost all the major technical processes for making and decorating glass had been discovered and put into use. Greece seems to be one of the few countries in which glass was slow at getting started.

About the time of the 9th cent. glassmaking was well under progress in Mesopotamia and by the 11th cent. the Arabians were nearing a peak in their production of enamelled glass, a development which lasted until the 1300's.

*Venetian Glass.* About the middle of the 15th cent. we begin to find Venetian glass assuming some artistic form although it was not until the 16th cent. that it became the most perfect glass, both artistically and technically, of any glass produced in the world at this time. The light, airy, colorless forms and graceful shapes of this period made Venetian glass famous. In the 17th cent. the Baroque Movement had its influence and glass became highly ornamental and decoratively

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

complicated. "Venetian Glass" became a well-known name but it is a mistake to think that all such glass came from Venice. Some of it was also produced in other Italian cities like Padua, Florence, Genoa, and Mantua. By the 18th cent., however, the cut glass of Silesia and Bohemia had outshadowed that of Venice. Italian glass, in fact, even now in the 20th cent., has never come up to the peak it established with Venetian Glass of the 1500's Their contemporary products are technically good, but they still rely upon older glass for designs and shapes.

*German Glass.* The Rhineland was an important center for glass works between the 2nd and 4th cents. but glassmaking soon spread to other sections,—to Hesse, Bohemia, Bavaria and Silesia. In the 16th cent. the famous German green wine-glass, the **Römer,** was produced and in the latter part of the century opaque enamel painting on hollow-glass was developed. Then around 1600 in Prague a jewel-cutter to Emperor Rudolf II tried the process of jewel and gem cutting on glass and found that **glass cutting** could be successful. By about 1700 glass cutting had come into its own in Central Europe and the Silesian and Bohemian glass-cutters in particular were using the technique with great skill and perfection. Cut-glass survived through the periods and movements that followed,—through the baroque, the rococo, and so on until today when glass-cutting and engraving is one of the finest techniques we have for producing modern decorative glassware. Some of the best 20th cent. glass in Germany was turned out at the Arts and Crafts school of Zwiesel and, of course, at the Bauhaus at Dessau.

*French Glass.* Some small pieces of Nevers glass and a few pieces of enamelled glass of the 16th cent. are about all the good decorative glass France has produced until quite recently. Their main concern had been more practical glass like mirrors and window glass. The Paris Exposition in 1870, however, was a real impetus to artistic work in French glass. Three artists in particular, Brocard, E. Rousseau, and Gallé, began experimenting with glass coloring and decorating, and were the forerunners of the contemporary French artists like Marinot, Navarre, Daum, Marcel Goupy, Pissaro, Simonet and Dufresne who have produced some very fine glass for modern times. Marinot esp. has done unusual work with smoocth, thick glass using air bubbles for ornamentation.

*Dutch Glass.* During the 16th and 17th cents. the glass factories in the Netherlands were influenced both by Venetian and German glass and during the 17th cent. the English-discovered lead glass was also put into use in the Netherlands. Dutch glassmakers developed a method of decoration by scratching the glass with the point of a diamond, and later by dotting the glass surface with the diamond point. Greenwood and Wolff became the experts at this decorative technique. In the very late 19th cent. the idea of functionalism began to take form,—the idea of making useful, yet beautiful household articles. The Dutch architect, Berlage, helped promote the idea when he designed a glass dinner set in 1900. Soon there developed the glassware of simplicity, of pure shapes beautiful in themselves. When engraving was used it too was kept simplified, lending a dignity to the glass. C. de Lorm added his contribution to Dutch glass by carefully considering the use of the glasses first and foremost in his designing, but not forgetting the aesthetic qualifications in so doing. Other Dutch glass-artists of importance are Copier and Lebeau, Lanooy and Gidding.

*Scandinavian Glass.* No history of glass would be complete without something about Scandinavian glassware, even though it was of no outstanding importance until comparatively recent times. A factory for making plain bottles and household glassware was established at Kosta, Sweden, in 1741, but it was not until 1898 when the **Orrefors** factory was established that Swedish glass began to draw attention from other parts of the world. The Orrefors glassworkers are now concerned mainly wiht *Vackrara Vardagsvara,* or 'More beautiful things for everyday use', artistically producing even the cheaper soda glass so that the average working man and his family can enjoy glass designed by the country's leading glass-artists. At the same time they do exceptional work in luxury glass as well. It is at Orrefors where the noted artists Edvard Hald and Simon Gate create their glass masterpieces. Mr. Hald is the director of Orrefors, but he still finds time to design. Both he and Mr. Gate realize that the engraver's tool is a circular wheel and base their designs upon circles and curves. For this reason they often use the human figure in their designing for it lends itself to circular design very readily. They are assisted in their work by young designers like Viktor Lindstrand, Nils Landberg, and Edvin Öhström, all of whom help Gate and

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

Hald prove that no higher quality glass is produced in the world today than that of Orrefors.

Sweden is not alone when it comes to modern glass, for Norway and Denmark, too, have their contributions to make. The most important glass factory in Denmark is the Holmegaard factory in South Zealand, which is managed by the architect-designer, Jacob E. Bang, while in Norway it is the Hadeland Works where the artist-craftsman Sverre Pettersen does both engraved and hand-chased work in glass and crystal of striking modern character.

*English Glass.* Just when in between the 1st and 7th cents. A.D. glass was introduced into Britain, we are not sure. It is believed to have been before the 4th cent., however, for fragments of glass-making furnaces of that time have been unearthed. At any rate we know that in the 10th cent. a type of stained or colored window was used in the churches and that in the 1500's Edward VI, and later Queen Elizabeth, employed Venetian glass-workers in their courts. English glass became most important about 1675 when the famous English flintglass was developed. This was followed by the introduction of glass cutting with diamonds which made highly decorative glass fashionable about this time, and particularly decoration on the stems of the glasses. A government tax levied in 1746 upon the weight of glass, rather than its value, furthered the making of elaborate cut-out work. Enamelled glassware came into much use until 1777 when the government began taxing that as well as the clear glass. For a while during the middle part of the 19th cent. the English people tired of elaborately decorated glass although by the latter part of the century they once more delighted in it. 20th cent. Britain is concerned with glass as a science. Sheffield University's Society of Glass Technology is now carrying on scientific research and experimentation as part of England's contribution to the realm of glass.

*American Glass.* The first glass made in America was in the spring of 1609 at Jamestown, but the attempt soon died out. Two more trials were made at starting glass manufacturing in America, another one at Jamestown in 1621 and one in Salem, Massachusetts in 1641, but neither of these were successful either. The first glass industry of any true success in America was on Manhattan Island. Here in the Dutch settlement glass was made from 1645 on until about 1767. And in the meantime other plants were growing up in the new world. A Caspar Wistar, for example, started making bottles and window glass at South Jersey in 1739. After the death of Wistar in 1752 his son carried on with the plant and the work. **Wistar glasses** have become famous because of their broad bases and wide tops, and their decoration of floral designs in glass welded on to the surface of the vessels.

The next big name in American glass manufacturing is that of "Baron" Heinrich Stiegel, the czar of glassmaking from 1763 until the year he went bankrupt, 1774. His favorite color being blue, much of the work at his factory was produced in that hue. Part of the **Stiegelware** is thin, plain surfaced, light glass with a brilliant reflective quality, but some is quite ornamental,—either engraved, etched, gilted or enamel decorated.

The Boston and Sandwich Glass Company of Sandwich, Massachusetts, as the third important glass factory in America, was founded in 1825 by Deming Jarves. For the first few years the company turned out only blown glassware, but with the invention of the glasspressing machine in 1827, they changed their technique and pressed-glass soon became very popular. The discovery of petroleum called for lamp chimneys and Sandwich glass contributed its part, although the Boston and Sandwich Company has become more famous for the making of their strikingly colored glass in blues, greens, purples, and various color combinations.

The American glass produced during the period from about 1860 to 1890 was of poor design and craftsmanship. Shortly after 1890, however, the Libbey Glass Company of Toledo, Ohio, began making cut glass of very high quality and helped bring the glass industry back to its standard once more. Libbey did much for the glass industry, too, by his extensive glass exhibition at the Chicago Fair in the 1890's which drew wide attention. In his exhibit workers were shown making, cutting, and polishing glass. A spun glass dress for the Infanta Eulalie of Spain was also on display. A Libbey Plant worker, Michael Owens, in 1906 invented an automatic machine for blowing bottles and this, too, greatly furthered the production of glass in America. The Libbey Company now has developed into the Libbey-Owens-Ford Company. Together with the Pittsburgh Plate Glass Company they manufacture some of the most technically perfect and beautiful window and plate glass in the world. "Pyrex"

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

is another name well known in America today, particularly to the housewives. Glass bearing the Pyrex trade-mark can withstand oven heat and the Pyrex "Flameware" can even be used for cooking over a direct flame without breaking. The Corning Glass Company is doing further research in heat—withstanding glass and other phases of modern glass and production. The Steuben Division of Corning is now even taking first-rate artists into industry and turning out beautiful engraved glassware. Sidney Waugh is their best known regular glass designer to date. Glass-making in America, now developed into a highly technical science, is once more employing trained designers to work along with the production staff in the factories with the aim that excellently designed glassware can be mass produced and enjoyed by all.

*Modern Glass.* Glass has come to be accepted as part of our everyday lives almost as much as the food we eat or the clothes we wear. Everyone comes in contact with glass, hundreds of times each day. Besides vases and dinnerware, glass has found its all important place in architecture, not only in windows, mirrors, and parts of furniture, but in construction and insulation as well. **Glass brick,** for example, is used for parts of walls, or even for whole walls. These hollow, translucent blocks are so constructed that they will not crack or break even when subjected to the change of temperature from the cold outdoors on the one side to the warm interior on the other.

The glass used for insulation is **fiber glass,** the threads of which are between ten or fifteen times finer than a human hair, and yet greater in tensile strength than steel. These fine threads made from ground up marbles, are used either massed together in a web or in sheet form or are rolled into nodules and blown into the walls of old buildings. Fiber glass is not only used as an insulator of heat and cold in buildings, of sound and electricity, but also for deadening vibrations. Some fiber glass is used as a plant mulcher and a great deal of it is twisted into threads and woven into shower curtains, draperies, upholstery, etc. The outstanding features of fiber glass are that it cannot be destroyed by fire, water, acid, (except hydrofluoric), or insects, and that it will not rot or decay. These qualities find for it numerous other uses as well as those mentioned.

The glass industry is now making worthy contributions in the war, particularly in producing glass to replace much needed metals. One noteworthy example of this is **glass plumbing.** The glass pipes have been so perfected that they can stand rapid temperature changes and can be annealed and welded together for installation and repairing. Household utensils, too, are being made to withstand the heat of cooking and can replace metal pots and pans.

Other recent developments in glass include a *glass which absorbs infra red rays* and consequently serves as a shield to cut off the heat. This is being made use of mainly in hospitals as is the ultraviolet ray transmitting glass which helps kill germs. In addition there are the following types: **one-way glass,** which looks like a mirror in a lighted room but from an adjoining dark room appears as blue, transparent glass; **carbonated glass,** a honeycomb-like product, easily cut, sawed, or drilled, which is used chiefly for insulation, particularly in refrigerators; **tempered glass** which can be twisted or bent to about twenty degrees; **safety glass** which is shatterproof due to the layer of cellulose or plastic between the sheets of glass; and Polaroid which eliminates the glare of light.

The day of taking glass for granted is past; we are now beginning to realize its endless possibilities. Research and experimentation is going on constantly, progressively, scientifically to create new glasses and new uses for them. Artists are being called into the factories to design for mass-production manufacture. Architects are using glass as the key means for bringing interiors and exteriors together as one for more pleasant, healthful living. Manufacturers are packing their products in glass for greater sales appeal. In short, glass has arrived! See Glendinning, R. E., "American Craftsmanship in Glass", *Country Life Magazine,* Jan. 1941; Hildebrand, J. R., "Glass 'Goes To Town'", *National Geographic Magazine,* Jan. 1943; Keyes, H. **glasses, musical.** See MUSICAL INSTRUMENTS

**glass harmonica.** See MUSICAL INSTRUMENTS.

**glass painting.** A type of comparatively modern painting in China which has the painting applied directly to a sheet of glass. The glass is backed and framed and a metal hooklike device is added at the top so that the painting may be hung. —J.A.M.

**glass rolling.** See GLASS AND GLASSMAKING.

**glaze.** Literally, glass. Covering for clay bodies, ceramic wares. When subjected to fire, glazes melt into glassy coatings. Used for decoration and protection against moisture. Glazes are silicates. See CERAMICS I.

**glee.** A composition of three or more unaccompanied solo voices.

**glissando.** (1) A rapid slur, or portamento on stringed instruments. (2) A rapid scale-passage on the piano, slurred instead of striking each note separately.

**glockenspiel.** See MUSICAL INSTRUMENTS.

**gloria.** See Mass.

**Gloria in Excelsis, Gloria Patri.** See doxology.

**Gloria Tibi Domine.** Short doxology. "Glory be to Thee O Lord."

**gloriole.** An aureole.

**glory.** In painting, a representation of the heaven opened.

**glory hole.** See GLASS AND GLASSMAKING.

**glove silk.** Warp knit fabric originally used for gloves now for undergarments, dresses and gloves. May contain one or a combination of rayon yarns.

**glue.** Although commonly used as an adhesive for joining purposes, glue has been also a binding medium in paints. Through the Far East this is the traditional vehicle and is still the usual one in the tempera painting characteristic of the Orient. It is prepared from a wide variety of organic materials, bones, skins, and intestines of animals and fish. All of these supply gelatinous tissues from which a gelatin or glue is extracted by cooking with hot water. With the exception of fish glues, most of these dry to a hard gel that is dissolved first by soaking in cold water and then by heating until solution occurs. The finest gelatin or size is prepared from skins, often from parchment. This was a frequent medium in manuscript illumination. —G.L.S.

**glutton motif.** See PREHISTORIC ART.

**glyphic art.** The branch of art concerned principally with modeling plastic material and carving. Syn. *sculpture; modeling.*

**gniezno.** See POLISH ART.

**Gobelin tapestry.** See TAPESTRY.

**Godescalo, school of.** See Carolingian art.

**gofun** (Jap.). A white chalk wash often used as a ground by painters.

**gohei** (Jap.). Strips of cut paper attached to a straw rope and hung before Shinto temples.

**Gojo yaki** (Jap.). Pottery made in Yamashiro province.

**Gold Coast art.** See AFRICAN NEGRO ART.

**Golden Fleece, The.** See RUSSIAN ARTS.

**golden section.** That part of a line or figure in which the size of the smaller part is to the size of the greater part as the greater is to the whole.

**gold point.** Comparatively little used as a drawing instrument, there is some record to show that a wire or point of gold like that of silver, drawn over a slightly abrasive ground, has been employed in the arts. It is said to give a somewhat warmer tint than the line made by silver. —G.L.S.

**gold size.** See bole.

**Golgotha.** Calvary. (not cap.) A burial place. A place of torment or martyrdom.

**goliard.** See MEDIEVAL MUSIC.

**gondola pattern.** See JEWELRY.

**gong.** See MUSICAL INSTRUMENTS.

**gongorism.** See HISPANIC AMERICAN LITERATURE.

**gorge.** The concave portion of a molding or a groove.

**Gorgoneion** (Gr. *Gorgoneion* fr. *Gorgo* fr. *gorgos,* terrible). In Greek art, the face of the terrible, ugly Gorgon with exaggeratedly large features, wide open eyes, broad nose, and grinning mouth, and spiral curls; sometimes surrounded by curling snakes; has apotropaic significance. —L.T.S.

**Gothic.** Literally, in the manner of the Goths, which means in the style of the Northern barbarians before the light of the Renaissance shone. This derogative use of the term *more Gothico* for the whole of medieval-Christian art was used by Vasari in his *Life of the Painters* (1550), who followed in it, to some extent, Ghiberti's interpretation of the three eras in art: Golden Age of classical art—decline since Constantine — Italian revival through Giotto. Yet it is Vasari who emphasizes first the devastating influence of the barbarian Goths on the continuity of classical art. This interpretation (esp. in *proemio delle vite,* 1550, ed. Karl Frey, vol. 1, Munich, 1911, p. 188) was accepted by the author's contemporaries throughout the Renaissance and remained a stock phrase as long as classical and baroque aesthetics prevailed. Pre-Romanticism in England and the Central European countries and Romanticism throughout Europe since the last quarter of the 18th cent. destroyed the pseudo-historical pattern of Renaissance aesthetics. The reinstallation of Gothic art begins with the emotional-sentimental interpretation of Horace Walpole, the exponent of the "Gothic novel" and the artificial ruin. In the later Romantic era, esp. since the practical and theoretical contributions in the field of restoration and analysis of mediaeval buildings by Viollet-le-Duc (1814-79) have been made, the scientific approach gradually replaces lyrical enthusiasm. This second epoch based on empirical knowledge owes much to Lasteyrie, Mâle, Vitry, Aubert, Focillon, Dehio, A. Goldschmidt, P. Frankl, M. Dvorak, Kingsley Porter, C. R. Morey and others.

The present understanding is that Gothic describes the style of mediaeval art flourishing from about 1150 to 1420 in Italy, and to 1500 in the North. It has its origin in architecture and is therefore primarily an architectural style; yet the term is used in a derivative sense also for sculpture and painting. (Here it basically differs from the term *Renaissance* which has its roots in painting and sculpture.)

The Gothic style originated in the 12th cent. in the church architecture of Normandy and Burgundy. It is the first architectural conception in history in which building with solid masses is transformed into one of void spaces over a skeleton framework. The elements of this type of structure are: rib vaulting, the pointed arch, and the flying buttress. These features represent constructional improvements and each of them used individually can be found in preceding Romanesque French buildings of the late 11th and early 12th cents. Yet it is the combination of the three devices which transforms the structural element into a new aesthetical unit. **Cross ribs,** due to their function as weight carriers and distributors, make the vault supporting pilasters and columns more independent from the thrust of the ceiling and allow them to stretch out accordingly in a vertical direction. Gaining thus in height, the distance from pillar to pillar can now be varied to conform with the needs of the groundplan. The space between the supporting carriers becomes bridged by *ogivale arches* which, because of their shape also diminish the direct thrust. Finally, the **flying buttresses** are supporting cantilevers on the outside of the church which carry the weight of the ceiling away from the inside walls to the outside walls and down to the ground.

It becomes the main tendency in the development of Gothic architecture to fuse these structural parts more and more together. The number of subdividing ribs, forming an ornamental net along the ceiling, increases, and conducts the weight of the ceiling to the ground. Where the downward flowing ribs meet the clerestory, they often burst forth in flowers and buds. The ribs continue along the capital crowned columns or pillars as bundles engaged to their surface and lead the eye from the ground to the vault with their energetic action upward. Thus the functional downward direction implies at the same time aesthetically an upward trend of the architectural design. The vault stretched over the ribs becomes in consequence thinner and higher. The nave grows in height to unprecedented proportions while the walls become more and more perforated by screens of stone-carved galleries and stained glass windows. Colored glass transforms light into an expression of supernatural mood and significance. The ingenious relation of thrust, counterthrust and support increasingly replaces the solid walls, basic to all previous architectonic styles. The string course of the

CC-0. Gurukul Kangri University Haridwar Collection. Digitized by S3 Foundation USA

nave leading the eye toward the choirs and ambulatories around the choir enhance the importance of the main altar. The ambulatories also increase the number of individual chapels and the possibilities for processions. Sub-divided rooms along the side naves multiply and honeycomb the church interior. A balcony for the organ and the choir and a rose window, both of which on the entrance wall, create an answering accent to the choir and the altar. Altogether the interior is unified—not only vertically, but horizontally. The cross arms grow shorter, thus fusing to some extent with the main nave while the choir continues in the direction of the nave. The cruciform basilica with eastward orientation prevails, but toward the end of the Gothic style, hall churches with naves of equal height appear frequently.

On the outside the flying buttresses developed into a system of semi-arches adorned with pinnacles, canopies, and statues. This lace-like perforation of the walls and the buttresses in combination with a large amount of statuary lends an impression of great richness and lightness to the exterior. The portals further hollow out the walls, decorating the voided spaces with column-bound statues and bas-reliefs, the latter mainly above the doors. Towers are merged with the body of the building and express the vertical tendencies of the design with aspiring keeness. The cross-shaped groundplan, the verticalism of the elevation and a unified program of statuary on portals, flying buttresses, water spouts and balconies, together with the central rose window and the stained glass windows, transform the achievement of engineering calculation into the polyphonous symbolical ensemble of the *Corpus Christi* in architectural form. It is, as far as its theological message is concerned, a sermon in stone of sin, repentance and final redemption. The celestial hierarchy represents and protects the Christian universe while the world of Satan with chimeras and grotesques appears as its demonic counterpart. Thus medieval Gothic art, considered in terms of its spiritual goal and practical purpose, is a transcendental-ecclesiastic art; and although it abounds in realistic discoveries they are subordinated to and influenced by the transworldly spirit of medieval religiousity

We speak of an **early Gothic** period (ca. 1150 in France, 1180 in England, 1230 in Germany, 1220 in Spain), a **High Gothic** period (1250-1400) and a **late Gothic** or *Style Flamboyante* (1400-1500). With some of its characteristic features, the Gothic style announces itself in the churches of St. Etienne and St. Trinité in Caen in Normandy (1080) and appears developed in St. Denis in Paris (1140). From there it spreads eastward to Chartres (1130), Notre Dame, Paris (1160), Reims (1180), Amiens (1220), Strassburg (1220), Freiburg (1230), Magdeburg (1230), Köln (1250), Regensburg (since 1275), Wien (14th cent.), Prag (since 1344). In the westward direction, we find the cathedrals of Canterbury (since 1174), Peterborough (ca. 1200), Ely, Lincoln (ca. 1200), Salisbury (1220), Westminster Abbey (1245), Exeter (14th cent.), York (14th cent.), Gloucester (1330) as examples of the early and High Gothic, often rebuilt on Norman (Romanesque) structures.

Generally, these English cathedrals present double transepts and no flying buttresses. A tendency for unstructural ornateness finds its expression in the so-called **lierne vaulting**, an elaborate design of ribs on the vault, beginning with Gloucester cathedral. In the 15th cent. the *perpendicular style* transforms masonry practically into an art of carving as we see it in Kings College, Cambridge (1440) or in the Chapel of Henry VIII in Westminster, London (1503-1520). Actually, wooden ceilings in which the direction of the ribs are inverted like stalactites, or open ceilings, frequently replace the stone vault.

In Italy, the Gothic always remained an alien element and the Latin feeling for a balance of horizontals and verticals never subsided. The cathedrals of Siena (1260), the Pisa Campo Santo (1278), the cathedrals of Orvieto (1285), Florence (1296) and Milan (since 1386) may stand as examples.

In Spain, dependence on French groundplans fused with the native tendency for ornate even abundant decoration. The combination of Gothic with Moresque elements resulted in the so-called *Mudejar* (q.v.) style, flourishing in the 14th cent. The cathedral of Burgos (since 1221) and Toledo (1227) present typical examples of the somber and sumptuous qualities of the Spanish Gothic.

In *secular architecture*, the Gothic style has expressed itself abundantly in the diversified functions of civic life and of knighthood. Castles rise from picturesque and strategically dominating points (Mont St. Michel, Marienburg), city halls accentuate the market squares with their richly decorated façades (Louvain, Brussels, London, Westminster Hall), hospitals (Ghent, Lübeck) and patrician dwellings

(Venice, Ca'D'Oro) express civic pride competing with aristocracy and monastic orders. Gothic towns in the North and South present the appearance of a unified city plan, the first since the days of antiquity (examples of prevailingly Gothic forms: Oxford, Ghent, Luebeck, Rothenburg, Siena, Bologna). Irregular arrangement of streets, squares and dwellings, manifoldness in the treatment of each new task, abundant wealth of decoration, lend to the Gothic town, with its secular architecture, the most picturesque quality.
